HENRI I. of France, son of King Robert, and grandson of Hugues Capet, succeeded his father in July 1031, being then about twenty-seven years of age. His mother, Constance of Provence, who wished to favour her younger son Robert, excited a civil war, in which Eudes, count of Champagne, and Baldwin, count of Flanders, took her part, while the Duke of Normandy assisted Henri. Peace was made by Henri giving to his brother Robert the duchy of Burgundy, which was the beginning of the first ducal house of Burgundy. In the year 1035 Robert le Diable, duke of Normandy, died; and his son, William the Bastard, who succeeded him, was assisted by Henri in defeating several rivals who claimed the dukedom. A new pretender however arose some time after in the person of William of Arques, cousin to the late duke; and Henri of France, who had now become jealous of the power of William the Bastard, assisted his competitor, who however was in the end defeated by the Bastard about the year 1047. Henri married in 1044 Anna, daughter of Jaroslav, duke of Russia, by whom he had several sons, the eldest of whom, Philip, was crowned at Rheims in 1059, at seven years of age, by order of his father, who died in the following year, leaving Philip I. under the guardianship of Baldwin, earl of Flanders. [BALDWIN IV.]

HENRI II., born in 1118, succeeded his father, Francis I., in 1147.

In 1550 he concluded the war which was then pending with England, which gave up to him Boulogne for the sum of 400,000 crowns. About this time Mary Stuart, the queen of Scotland, then a minor, came to France under the guardianship of her uncles of Guise, and was betrothed to Francis, son of Henri. In 1552 Henri assisted Maurice, elector of Saxony, and Albert, marquis of Brandenburg, who had united for the defence of the religious and civil liberties of Germany against Charles V. Henri invaded Lorraine, and took Metz, Toul, and Verdun, which were from that time annexed to France. It is curious to see the French government, which persecuted Protestantism at home, taking up arms for the professed purpose of supporting the Protestants of Germany. After the abdication of Charles V. the war continued between his successor Philip II. and Henri, whose troops, under the command of the Constable Montmorency, were defeated by the Spaniards at the battle of St. Quentin in 1557: the French arms were likewise unsuccessful on the side of Italy, where the Duke of Alba commanded the Spaniards. The war ended in 1559 by the peace of Chateau-Cambresis, by which Calais, which had been taken the year before by the Duke of Guise, remained in the hands of the French. At the same time a double marriage was concluded between Elizabeth, Henri's daughter, and Philip II. of Spain; and between Margaret, Henri's sister, and the Duke of Savoy. The festivals given on this occasion had a tragical end. Henri was accidentally wounded at a tournament by the Count of Montgomery with the shaft of his broken spear, which struck the king on the right eye. Henri died shortly after, July 10th 1559. By his wife, Catherine de' Medici, he had four sons, of whom three reigned in succession after him, beginning with the eldest, Francis II. He also left several natural children by various mistresses. He had none however by his principal female favourite, Diana de Poitiers, whom he made Duchess of Valentinois, and who survived him. The great influence of the Guises began under his reign. [GUISE, DUKES OF.]

HENRI III., born at Fontainebleau in 1551, was the third son of Henri II. Under the reign of his brother, Charles IX., when he was called the Duke of Anjou, he fought courageously at the battles of Jarnac and Moncontour against the Huguenots. In 1573 he was elected King of Poland and the successor of Sigismund Augustus. Henri was crowned at Cracow; but a few months after, upon hearing of the death of his brother, Charles IX., he suddenly quitted Poland and returned to France, where he assumed the title of Henri III. His reign was a reign of unworthy favourites. A mixture of bigotry and debauchery, of vice and folly, characterised his court. Under his weak administration, factions and civil and religious wars desolated France; and instead of checking party spirit he was himself the leader of a party, and that party not the strongest. The king's party stood between the other two parties, that of the Ligueurs under Henri of Guise and that of the Huguenots under Henri of Navarre, and the war which ensued was appropriately called the War of the Three Henris. At last Paris revolted in favour of the Guises, and Henri had recourse to assassination, by causing the Duke of Guise and his brother the cardinal to be murdered. Most of the towns of France, indignant at this base act, rebelled; the parliament of Paris instituted his trial; and the pope excommunicated him. In this emergency, Henri felt for a moment his old spirit revive; he applied for assistance to his generous enemy, Henri of Navarre, who joined him with his army, repulsed the Duke of Mayenne, the leader of the League, and the two kings laid siege to Paris. During this siege a Dominican monk, named Jacques Clément, excited by the declamations of the Ligueurs, assassinated Henri III. at St. Cloud. Henri died on the 2nd of August 1589. He left no issue, and in him terminated the dynasty of Valois, which had reigned in France since the accession of Philip VI. in 1328.

HENRI IV., king of France and of Navarre, born at Pau in the Béarn, the 15th of December 1553, was descended in a direct line from Robert, count of Clermont, sixth son of Louis IX., who married, in 1272, Beatrix of Burgundy, heiress of Bourbon, and assumed the arms and the name of Bourbon. [BOURBON.] Henri's father, Antoine de Bourbon, married Jeanne d'Albret, only daughter and heiress of Henri d'Albret, king of Navarre, after whose death, in 1535, Antoine became king of Navarre in right of his wife. Henri IV., during his youthful years, was trained up to hardiness and privations in his native mountains, after which he was sent to the French court till 1566, when his mother Jeanne d'Albret recalled him to Pau and had him instructed in the Calvinist communion. In 1569 he was acknowledged at La Rochelle as the leader of the Calvinists, and fought at the battles of Jarnac and Moncontour in the same year. After the peace of 1570 he was invited to the French court, and two years after he married Margaret, sister of Charles IX. By the death of his mother, June 1572, he became King of Navarre. At the massacre of the St. Barthélemi, which followed close upon his marriage, Henri's life was spared on condition of his becoming a Roman Catholic; but as the court did not trust a conversion which was extorted by fear, he was kept under watch as a state prisoner for about three years. Having escaped in 1576, he put himself again at the head of the Calvinists, and began a series of hazardous and hard-fought campaigns, interrupted by short cessations of arms whenever Henri III. of France made promises of peace and toleration to his Calvinist subjects,—promises which he or the Guise never failed to break. Henri won the battle of Coutras in Guyenne, October, 1587, in which his antagonist

the Duke of Joyeuse was killed. In 1569 he made his peace with Henri III., and joined him against the League. Henri III. before he expired named the king of Navarre as his successor, telling him at the same time that he wished him a quieter reign than his own had been. Henri however was opposed by one half of the kingdom, which obeyed the Duke of Mayenne, whom the parliament of Paris had appointed Lieutenant-General, and he was obliged to raise the siege of the capital.

He soon after gained the battles of Arques and Ivry, received some reinforcements from Elizabeth of England, and pursued the war with renewed vigour. At last in 1593 Henri began negotiations with several of the leaders of the League, and as a preliminary condition of their submission he was induced to make a public profession of the Roman Catholic faith at St. Denis on the 25th of July of that year. In March 1594 Paris opened its gates to him, and Rouen and other cities followed the example of the capital. Charles, duke of Guise, likewise made his submission. In the following year the pope acknowledged Henri, and in 1596 the Duke of Mayenne submitted. It was not however till 1598 that all France acknowledged Henri, nine years after his assumption of the crown. The peace of Vervins, concluded in that year, put an end to the interference of Spain in the affairs of France. From that time till his death Henri enjoyed peace, with the exception of a short campaign against the Duke of Savoy in the year 1600, which terminated in favour of the French arms.

The king applied himself to reform the administration of justice, to restore order in the finances, and to promote industry and commerce. He established new manufactories; he introduced plantations of mulberry-trees and the rearing of silkworms, and he began the botanical garden of Montpellier. He embellished Paris, and founded the hospital of La Charité Chrétienne for invalid officers and soldiers; he added to the collection in the royal library, and encouraged and rewarded men of learning, among others Grotius, Isaac Casaubon, Joseph Scaliger, De Thou, Malherbe, &c. In his foreign politics he was the ally of England; he supported the independence of Holland, and took the part of the Protestants of Germany against the encroachments of Rudolf II. Henri was censured for his change of religion, and by none more earnestly than by his faithful friend and counsellor, Duplessis Mornay. On the other hand, many of the Roman Catholics never believed his conversion to be sincere. But the truth probably was that Henri, accustomed from his infancy to the life of camps and the hurry of dissipation, was not capable of serious religious meditation, and that he knew as little of the religion which he forsook as of that which he embraced. In his long conference at Chartres in September 1593 with Duplessis Mornay, which took place after his abjuration, he told his friend that the step he had taken was one not only of prudence but of absolute necessity; that his affections remained the same towards his friends and subjects of the reformed communion; and he expressed a hope that he should one day be able to bring about a union between the two religions, which, he observed, differed less in essentials than was supposed. To which Duplessis replied, that no such union could ever be effected in France unless the pope's power were first entirely abolished. ('Mémoires et Correspondance de Duplessis Mornay depuis l'an 1571 jusqu'en 1623,' Paris, 1824-34.)

By the Edit de Nantes, promulgated in 1598, Henri gave what he thought a full redress of the grievances under which his Protestant subjects had so long laboured, and such it would have proved, had the provisions of the edict been honestly and fully carried into effect, and had not the king's intentions been frustrated in great measure by the intolerance of the different parliaments and courts of justice. Henri found the finances of the kingdom in a most wretched condition; of 150 millions of livres taken from the people only 30 millions reached the king's coffers. His able minister Sully had the task of restoring order in this financial chaos. He adopted the method of letting the taxes by public auction; he entered into a rigorous examination of the accounts of former receivers-general and other agents, and introduced forms of accounts which were to be filled up and accompanied with the necessary vouchers, so that no pretence was left for obscurity or omission. During a ministry of fifteen years he reduced the taillie five millions of livres, and other imposts one-half: he redeemed 135 millions of debt, while he added four millions to the king's revenue, and left 35 millions in the treasury, besides a value of 12 millions in arms and ammunition, 5 millions expended in fortifications, and above 26 millions on public works and royal gratuities. (Bresson, 'Histoire Financière de la France,' Paris, 1829.) The sympathy which Henri felt and showed for the humbler classes of his subjects, whom his predecessors had looked upon as an inferior race of beings, would alone be sufficient to account for his popularity with the French people—a popularity which has survived all the eventful changes in that country. He is the only king of the old monarchy whose memory is still popular in France. His brilliant qualities, his tastes, even his failings, such as his excessive gallantry, were national, and they flattered the self-love and the vanity of the people. "He was," says the President Hénault, "his own general and his own minister. He united to a blunt frankness the most dexterous policy, to the most elevated sentiments a delightful simplicity of manners, and to an undaunted courage a most touching feeling of humanity and benevolence. He often forgave, and when forced to punish, as in the case of Eiron, he did it with extreme regret. His

life was repeatedly attempted by assassins who were stimulated by the old fanaticism of the League; and at last he was stabbed to death in his carriage, by Ravillac, on the 14th May 1610. He was succeeded by his son Louis XIII., under the guardianship of his consort Maria de' Medici. The grief for his death was deeply felt all over France. ('Mémoires de Sully,' Hénault and the other French historians: Thomas, 'Essai sur les Eloges;' and a collection of Henri's most remarkable sayings and doings, entitled 'L'Esprit de Henri IV.,' Paris, 1760.) Lenglet du Fresnoy, in the fourth volume of his 'Journal de Henri III.,' has published many letters of Henry IV. When the royal tombs at St. Denis were ransacked in the time of the Revolution (1793), the body of Henry IV. was found in very good preservation: his features appeared hardly changed.

HENRICO. [DAIRLA, HENRICO CATERINA.]

HENRY I, King of England, surnamed Beauclerc, or the Scholar, was the fourth and youngest son of William the Conqueror, by his queen Matilda of Flanders, and was born in 1068 at Selby in Yorkshire, being the only one of the sons of the Conqueror who was an Englishman by birth. His surname attests that he had received a more literary education than was then usually given either to the sons of kings or to laymen of any rank; and this advantage was seconded by natural abilities of a superior order. From an early age he and his next brother, William, appear to have monopolised the favour of their father to the exclusion of his eldest son, Robert (Richard, the second son, died in his youth); and Robert's first recourse to arms is even attributed to his indignation at having one day had a pitcher of water thrown down upon his head, in mockery or sport, at the town of L'Aigle in Normandy, by his two younger brothers, and at his father's refusal to punish them for the insult. If this incident took place at all it must however have been when Henry was a mere child, not beyond his eighth or ninth year: his brother William was about twelve years his senior. In the last days of their father's reign jealousies arose between these two brothers; and in this new family quarrel the father seems to have attached himself to the one who was on the whole most like himself in character. At his death in 1087, the Conqueror expressed his wish that William should be his successor in the crown of England, and only left Henry a legacy of 5000*l.* of silver. With 3000*l.* of this however Henry soon after obtained, from the facility of his brother Robert, the whole of the district of Cotentin, comprehending nearly a third of Normandy. Although in the first instance a quarrel between the two arose out of this bargain, they were afterwards reconciled; and in 1090, when the intrigues of William, now king of England, had excited a revolt of the Norman barons against Robert, Henry came to the assistance of the latter, and was chiefly instrumental in putting down the insurrection. Upon this occasion Henry gave a striking proof of the relentless determination of his character. Conan, a rich burgher of Rouen, one of the most active and powerful of those who had taken part in the treason, having fallen into the hands of his enemies, Duke Robert thought it punishment enough to condemn him to perpetual imprisonment; but Henry, deeming it expedient to have better security against his future attempts, led the unfortunate man, on pretence of giving him a view of the surrounding country, to the highest tower of the castle in which he was confined, and threw him over the battlements. When Robert and William made peace the following year, they turned their united arms against Henry, who was soon compelled to evacuate even his last stronghold—the fortress built on the lofty rock of St. Michael; after which he wandered about for some two years in a state of nearly complete destitution. At length, on the invitation of the inhabitants of the town of Domfront, he assumed the government of that place; and it would appear that from this *point d'appui* he gradually raised himself to the re-possession of nearly all the territory that he had lost. He also became reconciled to Rufus, and was in England and in the New Forest with that king when he came by his death (2nd of August 1100). That sudden and mysterious event (which very possibly his hand or his contrivance may have caused, and into which at least he never instituted any inquiry), made Henry king of England. His reign is reckoned from Sunday the 3rd of August, on which day he was crowned in Westminster Abbey by Maurics, bishop of London. The next day he published a charter confirming the rights and liberties both of the Church and of the nation, and promising the restoration of the laws of the Confessor, with only such alterations as had been made in them by his father. All the circumstances of Henry's accession furnish strong evidence of the great importance which the Saxon population had already recovered since the Conquest. Henry from the first put forward his English birth as one of his chief claims to acceptance with his subjects; and he hastened to strengthen this title by an act which almost amounted to a tacit admission that the rights of the old Saxon line were not yet extinct—his marriage with Maud, or Matilda, daughter of Malcolm, king of Scotland, and niece of Edgar Atheling, which, after a delay occasioned by the reluctance of the princess to unite herself to the supplanter of her house, and by the circumstance of her having been at least designed to pass her days as the inmate of a nunnery, if she had not actually taken the veil, was at last celebrated on Sunday the 11th of November. As soon as he assumed the crown, Henry affected a complete change of manners, laying aside the open licentiousness in which he had heretofore indulged, and with much apparent zeal clearing the court of the

mistresses and profligate minions of the late king; but this show of reformation, like most of his other professions, was soon found to be merely an expedient adopted for the purposes of the moment.

The history of the reign opens with the contest between Henry and his elder brother for the crown. At the moment of the death of Rufus the gallant and thoughtless Duke Robert, after a brilliant career of arms in the Holy Land, was lingering on his return home in the south of Italy, detained there by the fascinations of the beautiful Sibylla, daughter of the Count of Conversano, whom he eventually married and brought with him to Normandy. After his arrival in his own territories he threw away more time in a succession of festive displays, but at last he prepared to make a descent upon England. He landed with a considerable force at Portsmouth, soon after Whitsuntide, 1101. But this effort ended in nothing: Henry, having an army assembled at Pavensey, marched forward and overtook his brother before he could reach Winchester, of which it was his object to obtain possession. After some negotiation the two princes met in a vacant space between the armies, and in a few minutes agreed to make up their differences on the terms of Henry retaining England and Robert Normandy, with the proviso that if either died without legitimate issue the survivor should be his heir. The easy temper of the one brother and the craft of the other are equally conspicuous in this treaty, by which Henry extricated himself at little or no cost from all the inconveniences and hazards of his present position, while Robert at once relinquished the whole object in dispute, bating only what part of it he may have conceived was made over to him in his qualified and precarious reversionary right. It was by no means Henry's intention however that he should escape even at this sacrifice. Several of the English barons who possessed estates in Normandy, anxious for their own interests to secure the union of the two countries, had taken part in Robert's attempt: it was one of the stipulations of the treaty that a full pardon should be extended to all the subjects of either brother who might thus have gone over to the other; but no sooner was the duke returned to Normandy than Henry proceeded to take systematic measures for effecting the ruin of the leading barons who had deserted him. In this way he soon provoked a series of petty insurrections in England, which he easily crushed, extinguishing thereby, one after another, all the persons that were most obnoxious to him, and acquiring their estates to distribute among new men who were his devoted adherents. These proceedings could not fail to rouse the indignation of Robert, and Henry was not slow in taking advantage of the courses into which his irritated feelings drove him, to declare that the peace between them was for ever at an end. Circumstances were now in every way much more favourable for the English king than when he formerly contrived to avoid a contest of arms with his brother: on the one hand, some years of possession had established him more firmly on his throne; on the other, the strength of Duke Robert was broken and wasted, and his extravagance and misgovernment had both dissipated his means of every description and loosened the very tenure of his sovereignty. Henry, in the first instance, called upon him to cede the duchy for a sum of money or an annual pension; he then (1105), on this demand being scornfully rejected, crossed over to Normandy at the head of an army, and speedily made himself master of many of the chief places of strength.

The following year the English king, who had returned home, again crossed the seas with a more numerous force than before. About the end of July he commenced the siege of the castle of Tenchebrai; Robert, after some time, advanced to its relief; and on the 28th of September a long and sanguinary battle was fought between the two brothers before the walls of that fortress, the result of which was the utter ruin of Robert and his cause. He himself, after a last splendid display of the heroic valour which he had always shown, was taken prisoner, with 400 of his knights. He was condemned by his brother to confinement for life. According to Matthew Paris, an unsuccessful attempt which he soon after made to effect his escape was diabolically punished, on the order of his merciless brother, by the extinction of his sight: a basin of iron made red-hot was held before his eyes, which were kept open by force, until they were burned blind; and in this state the miserable prince survived for twenty-eight years, dying in Cardiff Castle, at the age of eighty, in February 1185, not quite twelve months before Henry: but the story seems inconsistent with the statement of William of Malmesbury, a contemporary, that the only evil he endured was that of solitude. Immediately after the victory of Tenchebrai Henry was, without opposition, acknowledged their duke by the Norman barons. About the same time also was terminated by a compromise, for the present, the dispute with Anselm, the archbishop of Canterbury, on the subject of investitures, which had been proceeding ever since the commencement of the reign. [ANSELM.]

The next six or seven years passed without any events of much moment. In 1113 however Henry was attacked in Normandy by Louis VI. of France and Fulk, earl of Anjou, acting in confederacy in support of the interests of William, styled Fitz-Robert, the son of Duke Robert, who had escaped the vengeance of his uncle, and became from this time a rallying-point for the friends of his father's house and the enemies of the English king. The war lasted for about two years, and was on the whole adverse to Henry; but he then managed, with his usual dexterity, to bring it to a close by a treaty, which restored to him all that he had lost, and for the present wholly detached the

Earl of Anjou from the cause of his young protégé. It had been agreed that a marriage should take place between William and the earl's daughter, Sibylla. That project was now given up, and it was arranged instead that Matilda, another daughter of the earl, should be united to Henry's only son, Prince William of England. But Henry seems to have made this engagement with no intention of ever fulfilling it: as soon as it had served its immediate purpose, he showed in the most open manner his disregard of every stipulation of the treaty. The consequence was the formation against him of a second continental confederacy, in which the earl and the king of France received the active and zealous co-operation of Baldwin, earl of Flanders. Another war of about two years followed, in which success inclined sometimes to the one side, sometimes to the other; but the death of the Earl of Flanders of a wound received at the siege of Eu, the secession of the Earl of Anjou, again drawn off by a renewal of the proposal for the marriage of his daughter, the intrigues of Henry with the disaffected Norman barons, and, finally, the mediation of the pope, brought it also, in 1120, to a termination entirely favourable to the English king.

Immediately after this peace Henry's brightest hopes were turned to sudden night by the frightful calamity of the loss, on Friday the 25th of November, of the ship in which his son had embarked at Barfleur for England: with the exception of one individual, a butcher of Rouen, all on board perished to the number of nearly 300 persons, including the prince, his half-brother Richard, his half-sister Marie, and the Earl of Chester, with his wife and her brother, who were the niece and nephew of the king, and about 140 of the members of the most noble houses of England and Normandy, of whom 18 were females. Henry is said never to have been known to smile after this blow. It did not however extinguish his spirit of ambition. Two years before this he had lost his consort, the good Queen Maud; and a daughter, Matilda, married in 1114 to the Emperor Henry V., was now his only legitimate progeny. In the hope of male offspring, he now (February 2nd 1121) espoused the young and beautiful Adela, or Alice, daughter of Geoffrey, duke of Louvain. Scarcely had he entered into this alliance when he found himself called to meet a new revolt in Normandy, excited by the restless Fulk, earl of Anjou, who now having lost all hope of the English marriage, had renewed his connection with Fitz-Robert, and again affianced to him his younger daughter Sibylla, putting him in the meantime in possession of the earldom of Mons. But this movement was very soon put down by Henry, who also contrived once more to gain over the fickle and venal Earl of Anjou, and so to deprive the Norman prince of the hand of the fair Sibylla, when he had it almost in his grasp.

When four or five years of his second marriage had passed without producing any issue, Henry determined upon the bold enterprise of endeavouring to secure the succession to his dominions for his daughter, the Empress Matilda, who had become a widow by the death of her husband in 1125. On Christmas-day 1126 she was unanimously declared his heir, in a great council of the lords spiritual and temporal assembled at Windsor Castle. The following year, in the octaves of Whitsuntide, she was married to Geoffrey, surnamed Plantagenet, the son of Fulk, earl of Anjou, to whom, although only a boy of sixteen, his father had renounced that earldom on his departure for the Holy Land, where he was a few years afterwards elected King of Jerusalem. Soon after this settlement of his daughter, Henry was relieved of a source of perpetual annoyance and apprehension by the death of his nephew William Fitz-Robert, which took place on the 27th of July 1128, in the twenty-sixth year of his age. This prince had not been abandoned by King Louis of France, who, after giving him in marriage Joan of Morienne, the sister of his queen, had first put him in possession of the countries of Pontoise, Chaumont, and the Vexin, and then, on the murder of Charles the Good, had invested him with the earldom of Flanders. The intrigues and the money of Henry however speedily stirred up against him a revolt of a party of his Flemish subjects, who putting Thiedric or Thierry, landgrave of Alsace, at their head, endeavoured to drive him from the country; and it was in a battle with Thierry, under the walls of Alost, that in the moment of victory he received the wound of which he soon after died in the monastery of St. Omer. It was not however till March 1133 that Henry's longings for a grandchild were gratified by the birth of Matilda's first child, Henry, styled Fitz-Empress, afterwards Henry II. Two other sons, Geoffrey and William, were born in the course of the next two years. These events had been preceded by such dissensions between the ex-empress and her husband as at one time occasioned their separation; and now that they were again living together, Henry and his son-in-law quarrelled about the Norman duchy, of which the latter wished to be put in immediate possession, according to a promise which he said had been given on his marriage. From these family broils Henry was only delivered by his death, which took place at Rouen on Sunday the 1st of December 1135, being the seventh day of an illness brought on by eating to excess of lampreys, after a day spent in hunting. He had completed the sixty-seventh year of his age and the thirty-fifth of his reign.

Besides the son and daughter born in wedlock that have already been mentioned, the genealogists assign to Henry I. the following natural children:—1, Robert, earl of Gloucester, who died, after a distinguished career, in 1146, by Nesta, daughter of Rhes-ap-Tudor,

prince of South Wales; 2, Richard, drowned in 1120 with Prince William, by the widow of Anskil, a nobleman of Berkshire; 3, Reginald, earl of Cornwall, who died in 1176, by Sibylla, daughter of Sir Robert Corbet, and wife of Henry Fitz-Herbert; 4, Robert, by Editha, daughter of Sigowolf, a Saxon nobleman; 5, Gilbert; 6, William, surnamed De Tracy; 7, Henry Fitz-Herbert, who was killed in battle in 1197, also, according to one account by Nesta; 8, Marie (otherwise called Maud, or Adeia), countess of Perche, another of those who perished in the shipwreck of 1120; 9, Maud, married to Conan the Great, earl of Brittany; 10, Juliana, married to Eustace of Breteuil, earl of Pacie in Normandy; 11, Constance, married to Roscelin, Viscount Beaumont in France; 12, another daughter, married to William Gost, a Norman; 13, another, married to Matthew Montmorency, the founder of the illustrious French family of that surname; and 14, Sibylla (otherwise called Elizabeth), who was married in 1107 to Alexander I. of Scotland, and died in 1122, by Elisabeth, wife of Gilbert de Clare, earl of Pembroke, and father by her of the famous Strongbow.

The character of Henry is sufficiently indicated by the facts that have been detailed. In a moral point of view it was detestable, but in the line of policy and craft it evinced superlative ability. In the midst of all his profligacy and unscrupulous ambition however he cherished a love of letters, and in his hours of leisure was fond of the society of learned men. It must be admitted also that his government, though arbitrary and tyrannical in a high degree, appears to have been on the whole a considerable improvement on that of his father and his elder brother. He may be said to have led the way in the reformation of the law and the constitution by his re-establishment, partial as it was, of the Saxon laws, and by his charter, the example of that series of subsequent royal concessions, the same in form though much more extended in amount, which lie at the foundation of the national liberties. There can be no doubt that the country made considerable social progress in his reign, undisturbed as it was by any internal commotion, and enjoying, notwithstanding much oppression on the part of the crown, probably a more regular dispensation of justice between man and man, and more security from disorder and violence, than it had known since the coming over of the Normans. Henry I. was succeeded on the throne of England by Stephen.

HENRY II., surnamed Fitz-Empress, was the eldest son of Geoffrey Plantagenet (so named from a sprig of broom—in Latin *planta genista*, in French *plante gent*—which he used to wear in his cap), earl of Anjou, and of Matilda, daughter of Henry I., king of England, whose first husband had been the Emperor Henry V. [HENRY I.] He was born at Le Mans, the capital of his father's dominions, in March 1133. In the struggle between Stephen and Matilda for the English crown [STEPHEN], Matilda's husband, Geoffrey, had by the year 1141 reduced nearly the whole of Normandy, and his infant son Henry had been acknowledged by the majority of the nobility of that country as their legitimate duke. In June of the following year Matilda's great supporter, her bastard half-brother Robert, earl of Gloucester, passed over to Normandy, and returned to England in December, bringing Prince Henry along with him, together with a small body of troops, obtained from the earl his father. Here the boy remained for nearly five years shut up for safety in the strong castle of Bristol, where his education was superintended by his uncle Gloucester, who was distinguished for his scholarship and love of letters. He returned to his father, in Normandy, about Whitsuntide 1147. In 1149 however, being now sixteen years of age, he recrossed the sea, and, at an interview held on Whitsuntide in Carlisle with his uncle David I. of Scotland, received from that prince the honour of knighthood, and concerted measures with him and his other friends for recovering his grandfather's throne. He returned to Normandy in the beginning of the following year, and was a few months afterwards, with the consent of his father, formally invested with that dukedom by Louis VII. of France, the portion of the country called the Vexin being ceded to Louis as the price of his consent to such arrangement. By the death of his father, on the 10th of September 1151, Henry became earl of Anjou, Touraine, and Maine. On Whit-Sunday of the year following, within six weeks after she had been divorced from her first husband, King Louis of France, he married Eleanor, in her own right countess of Poitou and duchess of Guienne or Aquitaine, an alliance which made him master of all the western coast of France, with the exception only of Brittany, from the Somme to the Pyrenees. Soon after this Henry sailed for England at the head of a small but well-appointed force. He and Stephen having advanced, the one from the west, the other from the east, came in sight of each other at Wallingford, and in an interview which they had there, standing on opposite sides of the Thames, agreed to a truce. The death of Eustace, Stephen's eldest son, having removed the chief obstacle to a permanent arrangement between the two competitors, a peace was finally adjusted in a great council held at Winchester on the 7th of November 1153, in which Stephen, adopting Henry for his son, appointed him his successor, and gave the kingdom of England, after his own death, to him and his heirs for ever. The death of Stephen, on the 25th of October 1154, made Henry, in conformity with this agreement, king of England without opposition.

The commencement of the reign of Henry II. is reckoned from his coronation at Westminster along with his queen, 19th December 1154.

His first proceedings were strikingly indicative of the system of combined energy and policy which continued to characterise his government. He dismissed the foreign troops which Stephen had brought into the kingdom; razed to the ground nearly all the numerous castles that had been erected throughout the country by the barons in the preceding twenty years of anarchy; and resumed with remorseless determination all the lands that had been alienated from the crown since the death of Henry I., the grants only excepted that had been made to the church and to William, the second son of Stephen. This last act of rigour, the most daring upon which he adventured, was undertaken with the express concurrence of the great council or assembly of the immediate tenants of the crown. He next proceeded to settle the succession, and for that purpose a great council was assembled at Wallingford, soon after Easter 1155, which ordained that after his death the crown should descend to his eldest son William, now in his third year, and in case of the death of William (which in fact took place the following year), to his younger brother Henry, who was as yet only a few months old. Oaths of fealty were at the same time taken to both the young princes. It was in another council, or parliament, as some writers call it, held at London after these arrangements had been made, that Henry, in conformity with the now established practice, granted a short charter, confirming, for himself and his heirs, to the clergy, the nobility, and the commons, all the rights, liberties, and customs ('consuetudines') which had been conceded by his grandfather Henry I.

His presence was now called for across the sea by the attempt of his younger brother Geoffrey to wrest from him his paternal inheritance of Anjou, Touraine, and Maine, on the pretence, as stated by some authorities, that the will of their father had directed that Henry should resign these earldoms as soon as he should have obtained possession of the English crown. After a very short contest Geoffrey was forced to give up his claim in exchange for a pension of 1000 English and 2000 Angevin crowns, which he enjoyed little more than a year. He died in 1158 at Nantes, the inhabitants of which city had chosen him for their governor, in consequence of which circumstance the place was immediately claimed by Henry, as having devolved to him as his brother's heir. Partly by force, partly by management, Henry succeeded in acquiring through this claim first the virtual and eventually the actual possession of the whole of Brittany; the only portion of territory that was wanting to complete his sovereignty over all the western coast of France, and indeed over nearly the entire half of that kingdom. Conan, the hereditary count or duke of Brittany, who was also earl of Richmond in England, was now in the first instance induced, or compelled, to sign a treaty by which he bequeathed the country after his death to his daughter Constantia, an infant, whom he affianced to Henry's youngest son Geoffrey. At the same time the neutrality of Louis of France was secured by another arrangement, according to which it was agreed that Henry's eldest son, William, should marry that king's infant daughter, Margaret (her mother was Constance of Castile, whom Louis had married after his separation from Eleanor), three castles in the Vexin being made over along with the princess as her dowry. Henry had already recovered from the young Malcolm IV. of Scotland the northern counties which had been taken possession of by his predecessor David I., and the cession of which in perpetuity had been one of Henry's engagements with his uncle in 1149; he had also driven back the Welsh from those parts of the English territory which they had seized during the reign of Stephen, and even, as it would appear, compelled the princes of North and South Wales to acknowledge him as their feudal superior. His next attempt was upon the great French earldom of Toulouse, which he claimed in right of his wife Eleanor, whose grandfather William, duke of Aquitaine, had married Philippa, the only child of William, the fourth earl of Toulouse. He was here opposed both by Raymond de St. Gilles, the descendant of a brother of earl William, in whose line the principality had descended for nearly a hundred years, and by Louis of France, whose sister had married Raymond, and to whom, besides, the progressive aggrandisement of his ambitious vassal was every day becoming a subject of more serious alarm. Henry's expedition to France in support of this claim is memorable for the introduction of the practice of commuting the military service of the vassals of the crown for a payment in money, an innovation the credit of which is attributed to Thomas à Becket, recently elevated to the place of chancellor of the kingdom. The contest which ensued was suspended by a peace in May 1160, by which Henry was allowed to retain a few places he had conquered in Toulouse; and although it soon broke out anew, it was after a few months put an end to by a second peace, concluded in 1162 by the mediation of pope Alexander III.

The history of the reign of Henry II. for the next eight years is principally that of his contest with the haughty and intrepid church man, who, from an obscure origin having advanced through the degrees of royal favourite, prime minister, and chancellor, to the ecclesiastical sovereignty of archbishop of Canterbury, forthwith proceeded to assume the bearing of a rival monarch, and made his former master feel that he was only half king in the dominions he called his own. [BECKET.] This struggle for supremacy between the church and the state was not even terminated by the murder of Becket, 29th of December 1170: the blood of the martyr crying from the ground was found

to be still more powerful than had been his living voice. In 1174 Henry performed an abject penance at his tomb for having been the unintentional instigator of his slaughter; and two years after, the famous constitutions of Clarendon, passed in 1164, by which the clergy had been made amenable to the civil courts, and the church in other respects subjected to the royal authority, were, after having been long practically disregarded, at last formally repealed in a great council held at Northampton.

Meanwhile two formidable insurrections of the Welsh in 1163 and 1165 had been repressed with great devastation of their country, and, in the second instance especially, with unusual cruelty. In 1166 a revolt of the people of Brittany against their duke Conan afforded Henry, after putting it down with his customary promptitude and vigour, a pretext for taking the government of the country out of the hands of that feeble dependent, and assuming to himself the direct administration of affairs in the name of his son Geoffrey and Conan's daughter Constantia, between whom, young as they both still were, the marriage-ceremony was now solemnised for the sake of this arrangement. On the 10th of September 1167, Henry's mother, the ex-empress Matilda, died at Rouen. Some further hostilities in which he now became involved with the French king were, before producing any important result, terminated by a new peace concluded at Montmirail, 6th of January 1169. By this treaty it was arranged that Henry, the king of England's eldest son, should do homage to Louis for the earldoms of Anjou and Maine, and that his second son Richard should in like manner hold the duchy of Aquitaine of the French king, and espouse Adalais, or Alice, the youngest daughter of Louis. But the greatest event which divided the manifold activity of king Henry with the affairs of Becket was the conquest of Ireland, which was begun in 1169 by a body of private adventurers, headed by Richard de Clare, earl of Pembroke, the celebrated Strongbow, and completed by Henry in person, who crossed over from Milford to Waterford with a powerful armament, 18th of October 1171, and after making an unresisted progress through the country, during which he received the submission of the princes of all parts of it except Ulster, and holding his court or assembling councils at Dublin, Cashel, and elsewhere, sailed back from Wexford to Portloman in Wales, on Easter Monday, the 17th of April 1172. The national spirit however recovered itself after this first prostration, and a protracted struggle ensued between the people and their invaders; but the acquisition of Ireland was finally sealed by a formal treaty concluded in 1175 with Roderick O'Connor, considered the head king of the country, in which he consented to become Henry's liegeman, to pay an annual tribute, and, although he was still to retain his nominal royalty for his life, to hold his crown in subjection to the English king.

Much of the remaining portion of Henry's life and reign presents an involved and deplorable scene of family discord and contention; sons against their father, wife against husband, brother against brother. His eldest son Henry had not only been invested, as mentioned above, with the earldoms of Maine and Anjou, but, being then sixteen years of age, had, after the custom which prevailed in the French monarchy, been, as heir-apparent, solemnly crowned in Westminster Abbey on Sunday, 15th of June 1170. On this account that prince is in old writings sometimes styled Henry III., and his common title during his life was from this date the junior or younger king; that of the senior or elder king being given to his father. In 1172 the ceremony of his coronation was repeated, his wife Margaret of France being this time crowned along with him. Soon after this, at the instigation, it is said, of his father-in-law King Louis, the prince advanced the extraordinary pretension that he had become entitled actually to share the royal power with his father, and he demanded that Henry should resign to him either England or Normandy. His refusal was speedily followed (in March 1173) by the flight first of the prince, then of his younger brothers Richard and Geoffrey, to the French court. Richard professed to consider himself entitled to Aquitaine in virtue of the homage he had performed to Louis for that duchy after the peace of Montmirail, and Geoffrey founded on his marriage and his investiture some years before with the principality of Brittany a similar claim to the immediate possession of that territory. About the same time Queen Eleanor also left her husband to associate herself openly with the rebellion of her sons, of which she had in fact been the prime mover; for Henry's infidelities and neglect—the appropriate retribution of the indecent precipitancy with which she had thrown herself into his arms—had long changed this woman's love into bitter hatred and thirst of revenge. She was also making her way for the French court, nothing perplexed, as it would seem, by the awkwardness of seeking the protection of her former husband, when she was caught dressed in man's clothes and brought back to Henry, during the rest of whose life she remained in confinement. Her capture however did not break up the unnatural confederacy of her sons. We can only notice the leading incidents of the confused and revolting drama that ensued. The cause of young Henry was supported not only by Louis, but also by William of Scotland, and by some of the most powerful both of the Norman and the English barons. With his characteristic energy and activity however the English king made ready to meet his various enemies at every point. Hostilities commenced both on the continent, whither Henry pro-

ceeded in person, and on the Scottish borders, in the summer of this same year. Occasionally suspended, and again renewed, the war continued for about two years, during which the most important event that happened was the capture of king William of Scotland at Alnwick Castle, by the famous chief-justiciary Glanville, 12th of July 1174, which appears to have been the Saturday following the Thursday on which Henry did penance before the tomb of Becket at Canterbury. Soon after this Henry, who had throughout decidedly the best of the contest, assented to the petition of his sons for a peace; he and King Louis restored whatever they had taken from each other, and young Henry, Richard, and Geoffrey were gratified with the possession of one or two castles each, and liberal allowances from the revenues of the provinces to which they had severally laid claim. A new quarrel broke out between Henry and his eldest son the following year, but they were reconciled before they had time to betake themselves to arms. Meanwhile in December 1174 a treaty with Scotland had been signed at the castle of Falaise, in Normandy, by which the Scots agreed to make acknowledgment of the feudal dependence of their crown on that of England, in return for the liberation of King William. The period of seven or eight years that followed was the most tranquil of Henry's reign, and that in which his greatness stood at the highest. With his ancestral dominions of England, Normandy, and Anjou undisturbed by any rival claimant, his matrimonial acquisitions of Aquitaine and Poitou, bound in the subjection of fear, if not of attachment, his conquest of Ireland secure, the Welsh and the Scotch reduced to submission and to the acknowledgment of his supremacy, he was undoubtedly at this time the most powerful of the European sovereigns.

In 1183 however another outbreak of the fierce and turbulent spirit of the princes led the way to a new succession of family wars. This time Richard took up arms against Henry and Geoffrey, because his father called upon him to do homage to Henry for Aquitaine. A reconciliation between the brothers, effected by their father's interference, only suspended hostilities for a few months; the old king and his son Richard were then compelled to take the field against the other two. After deserting his father and his youngest brother alternately about half a dozen times, Prince Henry was suddenly taken ill, and died at Château-Martel, 11th June 1183, in the twenty-seventh year of his age. Geoffrey still held out, supported by the chief nobility of Aquitaine, where there was a strong feeling of the people against the English king for his treatment of their hereditary chieftainess Eleanor; but he too in a short time made his submission and implored his father's pardon. A solemn family reconciliation then took place, at which even Eleanor was released from her prison and allowed to be present. But it did not last for more than a few months; Geoffrey then, in consequence of his father refusing to surrender to him the earldom of Anjou, fled to the court of France, where Philip II. was now king, and prepared for a new war; but before he could carry his design into execution he was, in August 1186, thrown from his horse at a tournament, and so severely injured that he died in a few days after. No sooner was Geoffrey thus removed than his brother Richard hastened to the French court to take his place; but after unsuccessfully attempting to excite a new revolt in Aquitaine, he was compelled to throw himself upon his father's clemency. A project of a new crusade, at the call of pope Clement III., in the beginning of 1188, for a moment united Henry and Philip; the impetuous Richard actually took the cross, carried away by the feeling which thrilled all Europe on the arrival of the news of the capture of Jerusalem by Saladin in the preceding September; but before the end of the same year the unhappy father saw his son again bearing arms against him in alliance with the French king. The pretext on the part of Philip and of Richard for this new war was Henry's refusal to deliver up the Princess Alice, the sister of Philip, and the affianced bride of Richard, whose person, as well as part of her dowry, he had for many years had in his possession. Richard pretended to believe that his father wished to marry the princess himself, and even asserted or insinuated that her honour had already fallen a sacrifice to Henry's passion; it appears to be certain however that her restitution was only made a demand of the two confederates for popular effect, and was a very small part of their real object. Richard, having first done homage to Philip for all his father's continental possessions, immediately proceeded to wrest them from the old man by the sword. Henry's spirit seems now to have given way at last, and the resistance he offered to his son was feeble and ineffective. The pope made an attempt to bring about a reconciliation, which failed; in the end Henry was compelled to sue for peace, on which he and Philip met on a plain between Tours and Azay-sur-Cher, when it was agreed, among other humiliating conditions, that all Henry's vassals, both continental and English, should do homage to Richard, in acknowledgment of his rights as heir-apparent, and that all those persons who had taken his side should from that time be considered as his liegemen, unless they should of their own accord return to his father. Henry was stretched on a sick-bed when this treaty was read to him; but when he found in the list of those that had deserted him to join Richard, his youngest and favourite son John, whose fidelity till now he had never had cause to suspect, the discovery appears to have broken his heart; he turned himself to the wall, saying that all his interest in the world was over. He was soon after removed to Chinon,

on the Loire; and there, after a few days more of suffering, he died, 6th of July 1189, in the fifty-seventh year of his age and thirty-fifth of his reign. He was buried in the choir of the abbey of Fontevraud, in the presence of his son Richard, who succeeded him on the throne.

The character of this great king is a mixture of all the qualities, good and bad, naturally arising out of a strong intellect, a strong will, and strong passions. His faculties had in early life received a learned training, and to the end of his days he preserved an attachment to literature and to the conversation of scholars. The age was distinguished throughout Western Europe, both from that which preceded and from that which followed it, by a revival of elegant letters, which, from its speedy evanescence, appears to have been premature; and Henry drew around him many of the chief lights of the time, both natives of England and of other countries. Among these two of the most conspicuous names were John of Salisbury and Peter of Blois, both of whom have left us ample testimony, in their writings, how greatly they were dazzled by his brilliant and commanding genius. And if on the one hand he was ambitious, unscrupulous, licentious, and easily kindled to frantic excesses of rage, it must be admitted on the other that he was neither a cruel nor a vindictive or unforgiving enemy, and that he was far from incapable of generous and kindly emotions. He has that hold upon our sympathies which springs from the feeling that his enemies were worse men than himself, and from the pity excited by the tragic close as contrasted with the earlier course of his history, which taken altogether is one of the saddest and most affecting of those which preach to us the instability of fortune and the vanity of human ambition.

The government of England during this reign was still nearly as despotic in principle as in the days of the Conqueror and his sons, but the more advanced social condition of the country and the firmer establishment of the new dynasty combined with the temper of the king to render it considerably less oppressive in practice. The augmented security and strength of the crown, and the measures which Henry took to depress or curb the aristocracy, had the effect of relieving the people to some extent of one, and that perhaps the most severe, of the two tyrannies under which they suffered, without adding to the weight of the other. While the power of the barons was curtailed or restrained, that of the throne was certainly not exercised with more, but rather with less insolence and rapacity than formerly. The laws were also administered with greater regularity during this reign than they had been since the Conquest; if the original *curia regis*, or royal court, was not already separated into the subdivisions out of which have sprung the present Courts of King's Bench and Common Pleas (which is doubtful), the important institution of justices itinerant, or justices in eyre, as they were styled, that is, judges making periodical circuits through the kingdom for the trial of causes, was now made a permanent part of the judicial establishment of the country. Another important legal improvement now introduced was the substitution in the trial of the species of action called a writ of right of the grand assize, for the old ordeal of battle. The earliest of the English law-writers, Ranulf de Glanville, the supposed author of the Latin treatise entitled 'Tractatus de Legibus et Consuetudinibus Angliæ,' held the office of chief-justiciary in the time of Henry II. To this reign also belong the 'Dialogus de Scaccario,' and the two collections of charters, &c., known as the 'Liber Niger' and the 'Liber Ruber.'

Henry's children by his queen Eleanor were: 1, William, born 1152, died 1156; 2, Henry, born 28th of February 1155, died 11th of June 1183; 3, Mand, born 1156, married to Henry V., duke of Saxony, died 1189, a few days after her father; 4, Richard, who succeeded him on the throne; 5, Geoffrey, born 28th of September 1158, died 19th of August 1186; 6, Eleanor, born 13th of October 1162, married to Alphonso VIII., king of Castile, died 1214; 7, Joan, born October 1164, married to William II., king of Sicily, died 4th of September 1195; and 8, John, who succeeded Richard as king. His illegitimate children were: 1, by the famous Rosamund, daughter of Walter, lord Clifford, William, surnamed De Longespée, who became Earl of Salisbury in right of his wife Ela, daughter and heiress of William Devereux, died 1226; 2, by the same, Geoffrey, who became Bishop of Lincoln, lord chancellor, and afterwards archbishop of York, and died 18th of December 1212; and 3, by the wife of Rodolph Blewit, Morgan, a churchman, who held the office of provost of Beverley.

HENRY III., surnamed of Winchester, from the place of his birth, was the eldest son of King John by his queen, Isabella of Angoulême, and was born on the 1st of October 1206. His father having died on the 18th of October 1216, the boy was, chiefly through the influence of the Earl of Pembroke, lord marshal, acknowledged heir to the throne by those of the barons who were opposed to the French party; and on the 28th he was solemnly crowned in the abbey-church of St. Peter, at Gloucester, by the papal legate Gualo. His reign is reckoned from that day.

On the 11th of November following, at a great council held at Bristol, Pembroke was appointed protector or governor of the king and kingdom (Rector Regis et Regni); and this able and excellent nobleman continued at the head of affairs till his death in May 1219; long before which event the dauphin Louis and the French had been compelled to quit the country, their evacuation having been finally arranged in

a conference held at Kingston on the 11th of September 1217. After the death of Pembroke the administration of the government fell into the hands of Hubert de Burgh, who had greatly distinguished himself in the expulsion of the foreigners, and Peter des Roches, bishop of Winchester. De Burgh however and the bishop, who was not an Englishman, but a native of Poitou, from coadjutors soon became rivals, and their attempts to throw each other down at length led in 1224 to the resignation of Des Roches and his retirement from the kingdom. Meanwhile, on the 17th of May 1220, Henry, in consequence of some doubts being entertained about the efficacy of the former ceremony, had been crowned a second time at Westminster by Langton, archbishop of Canterbury. In 1221 the relations of peace and alliance with Scotland, which had subsisted ever since the departure of the French, were made closer and firmer by the marriages of Alexander II., the king of that country, with Jane, Henry's eldest sister, and of De Burgh with the Princess Margaret, the eldest sister of Alexander. About the same time Pandulf, who had succeeded Gualo as papal legate, left the country, which was thus practically freed from the domination of Rome, although that power still persisted in asserting theoretically the vassalage of the crown which had been originally conceded by John, and which had also been acknowledged at his accession by the present king.

In 1222 Henry had been declared of age to exercise at least certain of the functions of government; but his feeble character was already become sufficiently apparent, and this formality gave him no real power. It only served to enable De Burgh the more easily to get rid of his colleague. That minister, now left alone at the head of affairs, conducted the government with ability and success on the whole, though in a spirit of severity, which, whether necessary or not, could not fail to make him many enemies. A war broke out with France in 1225, which however was carried on with little spirit on either side, and produced no events of note, although Henry in May 1230 conducted in person an expedition to the Continent, from which great things were expected by himself and his subjects; but he returned home in the following October, without having done anything. At this time France was suffering under the usual weakness and distraction of a regal minority, Louis IX., afterwards designated St. Louis, having while yet only in his twelfth year succeeded his father in 1226. A growing opposition to De Burgh was at length headed by Richard, earl of Cornwall, the king's brother, who possessed very great influence, not only from his nearness to the throne, but from his immense wealth; and the consequence was the sudden expulsion of that minister from all his offices, and his confinement to prison, with the loss of all his honours and estates, in the latter part of the year 1132. Des Roches, the bishop of Winchester, who had returned to the country some time before this crisis, was now placed at the head of affairs; but his administration, a course of insulting preference for his countrymen and other foreigners, and of open hostility to the great charter and the whole body of the national liberties, speedily proved unbearably distasteful to both barons and commons; and a confederacy of the laity and the clergy, with Edmund, archbishop of Canterbury, at its head, compelled his dismissal within little more than a year after his restoration to power. The archbishop now became chief minister. In 1236 Henry, being now in his thirtieth year, married Eleanor, the daughter of Raymond, count of Provence; and this connection soon gave new and great umbrage to the nation, in consequence of the numbers of her relations and countrymen who came over with or followed the queen, and with whom she surrounded her weak husband, besides inducing him to gratify their rapacity with pensions, estates, honours, and the most lucrative offices in the kingdom. In the midst of the contests thus occasioned between the crown and the nobility, whose meetings for deliberation on national affairs were now commonly called parliaments, a renewal of active hostilities with France was brought about through a private resentment of Henry's mother Isabella, who after the death of John had returned and been re-married to Hugh, count of La Marche, to whom she had been espoused before she gave her hand to John: she had instigated La Marche to insult and defy Alphonso, count of Poitou, the brother of the French king, after doing homage to him, and had then prevailed upon her son, the King of England, to take her part in the war with France that ensued. Henry again sailed for the Continent, but this expedition was still more unfortunate and disgraceful than the former: after being beaten by Louis in a succession of actions, he was glad to get home again, with the loss of army, money, baggage, and everything. A new truce for five years was then agreed to between the two countries.

These events of course did not tend to put the nation in better humour with the king, or to dispose the parliament to greater liberality. The contest with the crown however ended for the present in an attempt on the part of Henry to govern by the prerogative, which was so far successful that no effective resistance was made to it for many years. In the pressure of his embarrassments he several times re-assembled the legislative body, but no accommodation was effected by these advances; the parliament was found as impracticable as ever, and the king resumed his arbitrary courses. In 1253 he succeeded in obtaining a grant of money by consenting to a solemn ratification of the great charters—a ceremony which had already been repeatedly performed in the course of the reign; and this enabled him to proceed at the head of a military force to Guienne, where a revolt against the

English dominion had been excited by Alphonso, king of Castile. The dispute was soon settled by the arrangement of a marriage between Henry's eldest son, Prince Edward, and Eleanor, the sister of Alphonso. [EDWARD I.] After this Henry engaged in a project which speedily involved him in a complication of difficulties—the acceptance of the nominal crown of Sicily for his second son Edmund from Pope Innocent IV., who pretended to have it at his disposal in consequence of Frederick II., the late king, having died (1250) in a state of excommunication, and who had ever since been hawking about the empty title among the princes of Europe, without finding any one simple enough to close with his proposals till he applied to the King of England. The exorbitant extent to which Henry was forced to carry his exactions in order to meet his engagements with the pontiff raised a spirit of resistance, which grew stronger and stronger, till it broke out into an open revolt against the supremacy of the crown. What is called by most of the old chroniclers 'the mad parliament,' assembled at Oxford on the 11th of June 1258, by adjournment from Westminster, where it had met on the 2nd of May previous; and placed the whole authority of the state in the hands of a committee of government, consisting of twelve persons appointed by the barons and as many by the king. The leader of the barons on this occasion was the famous Simon de Montfort, who was a Frenchman by birth, being the youngest son of the Count de Montfort, but who, in right of his mother, had succeeded to the English earldom of Leicester, and had so long ago as the year 1238 married Eleanor, countess-dowager of Pembroke, a sister of King Henry. After the enjoyment however of a long course of court favour he had quarrelled with and been insulted by his royal brother-in-law in 1252, and, although they had been apparently reconciled, it is probable that the feelings then excited had never been extinguished in either. From the imperfect accounts and the partial temper of the annalists of the time, it is difficult to obtain a clear view of De Montfort's character and objects; but if his position may be reasonably suspected to have acted upon him with its natural temptations, and led him to form designs more ambitious than he could venture openly to profess, it must be admitted that he stands remarkably free from any well-established or even probable imputation affecting his actual conduct, and that he was undoubtedly a person both of eminent ability and of many excellent as well as popular moral qualities. His cause was also undoubtedly in the main that of the national liberties, and he appears to have had throughout the national voice and heart with him. He and his friends soon contrived to monopolise the whole power of the committee of government, and compelled the principal nominees of the king not only to relinquish their functions, but to fly from the kingdom. Dissensions now however broke out in the dominant party, and De Montfort found a rival aspirant to the supreme power in another of the great barons, Richard de Clare, earl of Gloucester.

The quarrels of the adverse factions enabled Henry, in the beginning of the year 1261, altogether to throw off the authority of the committee of government; and although the parliamentary party was on this occasion joined by Prince Edward, it was for the present effectually put down, De Montfort himself being obliged to take refuge in France. He returned however in April 1263, and being now supported by Gilbert, earl of Gloucester, the son of his late rival, proceeded to prosecute his quarrel with the crown by force of arms. Henry had now his son Edward on his side; but the success of the insurgents nevertheless was such as to threaten the complete overthrow of the royal power, when an accommodation was effected through the interference of the king's younger brother, Richard, earl of Cornwall, called King of the Romans, to which dignity he had been elected a few years before. The result was to place De Montfort and his friends once more at the head of affairs, the king being reduced to a cipher, or a mere puppet in their hands. In the course of a few months however we find the war between the two parties renewed. The contest of arms was suspended for a short time in the beginning of the following year (1264) by an appeal on the part of a number of the most influential barons and bishops to the arbitration of Louis IX. of France; but his award, which was upon the whole favourable to Henry, was very soon disregarded. On the 14th of May the forces of the barons, led by De Montfort, and those of the royalists, commanded by the king in person, and by his son Edward, met at Lewes, in Sussex, where the former gained a complete victory, both Henry and his son being taken prisoners. This success of course once more placed all the power of the kingdom at the feet of the great baronial leader; his arrogance and assumption of superiority however, it is said, had already alienated from him some of his most powerful adherents, and disposed them to take measures for the restoration of the royal authority, when, on the Thursday of Whitsun-week 1265, Prince Edward contrived to make his escape from Dover Castle, and to join the Earl of Gloucester, who had now deserted the interest of De Montfort, and waited to receive him with an army at Ludlow in Shropshire. This event immediately led to the renewal of the war. On the 4th of August the two parties again encountered at Evesham; Edward here gave brilliant proof of the military talent which distinguished his future career; and the result was the defeat of the baronial forces with immense slaughter, De Montfort himself and his son Henry being both in the number of the slain. In this battle the king is said to have had a narrow escape: the earl, in whose camp he was, had compelled him to put on armour

and mount a war-horse, from which he was thrown down in one of the charges, and would probably have been put to the sword or trampled to death had he not called out that he was 'Harry of Winchester,' when his voice was heard by his son, who came up and rescued him.

The victory of Evesham however, although it liberated Henry and re-established the royal government, did not completely put down the defeated party. The adherents of De Montfort maintained themselves, notwithstanding all the efforts of Prince Edward, in various parts of the kingdom, for more than two years longer. Even after the parliament, in October 1267, had passed an Act of Concord, known by the name of the 'Dictum de Kenilworth,' by which easy terms of pardon were offered to all who would submit themselves, the insurrection was renewed by the people of London, with the Earl of Gloucester at their head; but that rash and fickle personage almost immediately threw himself upon the king's mercy without drawing the sword, and was glad to obtain pardon through the mediation of the King of the Romans, leaving his followers to their fate. A final arrangement was at last effected in a parliament which met at Marlborough on the 18th of November. The short remainder of the reign of Henry after this date passed without disturbance or any remarkable events. His son Edward, leaving everything tranquil, set out for the Holy Land in July 1270, from which he had not returned when Henry died at Westminster on the Feast of St. Edmund, being the 16th of November 1272, in the sixty-seventh year of his age and the fifty-seventh of his reign.

The children of Henry III., by his wife Eleanor of Provence, were—1, Edward, who succeeded him; 2, Margaret, born in October 1240, married to Alexander III. of Scotland, at York, on the 26th of December 1251, died on the 26th of February 1275; 3, Beatrice, born at Bordeaux on the 25th of June 1242, married to John de Dreux, duke of Brittany and earl of Richmond, at London in 1260, died in 1273; 4, Edmund, surnamed Crouchback (probably from the crouch or cross which he wore upon his back, as having made the voyage to Jerusalem), born on the 16th of January 1245, created earl of Chester in 1253, earl of Leicester in 1264, earl of Lancaster in 1267, died in 1295; 5, Catherine, born on the 25th of November 1253, died in 1258; and four sons, Richard, John, William, and Henry, who died in infancy.

The reign of Henry III. is especially memorable in the history of the constitution as affording us the first distinct example of a parliament constituted as at present, of representatives from the counties, cities, and boroughs, as well as of the barons and higher clergy, or great tenants of the crown, lay and ecclesiastical. The assembly in question met at London, on the 22nd of January 1265, having been summoned in the name of King Henry, while he was in the hands of De Montfort, a few weeks before: hence this great leader of the barons has been regarded as the introducer of the principle of popular representation into the English constitution, and the founder of the House of Commons. The fact simply is however that the writs for his parliament of 1265 are the earliest extant directing the return of knights of the shire and representatives of cities and boroughs. There is nothing either in the writs themselves, or what is more important, in the notices of any of the contemporary historians, from which it could be gathered that what took place was an innovation. Moreover, county representation, as at least an occasional usage, may certainly be distinctly traced to a date half a century earlier than this.

Our statute law also begins with this reign, the earliest enactment on the statute-book being that entitled the 'Provisions of Merton,' passed in the 20th year of Henry III., 1235-36. Only two of the statutes passed in this reign however are extant on the rolls in the Tower, namely, 'Magna Charta' and the 'Charta de Foresta,' and even these are only found in charters of inexpressible, or confirmation, of the next reign. The 'Charta de Foresta' was first made a distinct charter in the 2nd of Henry III. (1217). For an enumeration of the repeated confirmations, both of that and of the great charter which were obtained in this reign, and which form the principal legislation of the period, the reader is referred to the 'Introduction to the Statutes at Large' in the edition of the Record Commissioners. Bracton's law treatise entitled 'De Consuetudinibus et Legibus Anglicanis' is assigned to the reign of Henry III.

HENRY IV., surnamed Bolingbroke, was the eldest son of John of Gaunt, duke of Lancaster, the fourth son of king Edward III. His mother was the Lady Blanch, younger daughter and eventually heiress of Henry Plantagenet, Duke of Lancaster, who was grandson of Edmund, second son of King Henry III. He was born at Bolingbroke in Lincolnshire in 1366, and as early as 1380 is styled Earl of Derby, which was one of his father's titles. In 1397 he was created Duke of Hereford, having married Mary, daughter and coheir of Humphrey de Bohun, the last earl of Hereford. He became Duke of Lancaster on the death of his father, February 3, 1399.

The first occasion on which the earl of Derby appears in English history is as one of the lords associated with Thomas, duke of Gloucester, the uncle of Richard II., in the insurrection of 1387. It appears however that whatever may have been the designs of the duke, the earl contemplated nothing more than the temporary control of the royal authority. Accordingly, in May 1389, when the king recovered his authority, his cousin Derby was one of the persons whom he immediately took into his confidence. Some of the years

immediately following these events, the earl is supposed to have spent on the Continent. We find him again in England in 1397 at the time of the seizure of Gloucester, which act, Richard, in a proclamation which he issued on the occasion, stated to have been done with his approbation. Within a few months, after being raised to the rank of Duke of Hereford, he and the Duke of Norfolk, formerly the Earl of Nottingham, who had also participated in Gloucester's rebellion ten years before, were involved in the same ruin with their former associates, in circumstances leading to a strong suspicion that, notwithstanding the forgiveness and even favour which he had apparently shown them, the insidious king had never forgotten their offence, but had still cherished a secret determination of revenge. It appears that while Hereford was riding from Brentford to London he was overtaken by Norfolk, who, entering into conversation with him, expressed his conviction, on grounds which he stated, that the king was preparing to destroy them. In some way or other, but how is doubtful, a report of this conversation reached the ears of the king. The consequence was that Hereford in obedience to a royal order appeared before Richard and the parliament at Shrewsbury, January 30, 1398, and there formally accused Norfolk of having spoken to him in the terms that have been mentioned. Apparently he had been induced to take this course as affording his only chance of escape from destruction; but it did not save him, although it perfectly answered the end the king probably had in view. The charge against Norfolk was in the first instance referred to a committee of twelve peers and six commoners, and eventually it was determined that it should be brought before a high court of chivalry. That court assembled at Windsor on the 29th of April, and awarded that wager of battle should be joined between the two dukes at Coventry on the 16th of September. When the day arrived and the combatants had entered the lists, and were on the point of advancing to the encounter, the king, who presided, suddenly threw down his warder, and so arrested both where they stood. Norfolk was ordered to go on a pilgrimage to the Holy Land, and banished from England for life; Hereford was also sentenced to quit the kingdom within four months, and to remain abroad for the next ten years. He retired to Paris, and while he was resident in that city his father the Duke of Lancaster died, February 3, 1399, on which Richard immediately seized his estates, on the pretence that the banishment of the son disqualified him from inheriting. This injury, and the advice of Arundel, archbishop of Canterbury, who had also been banished from England, determined Hereford, now Duke of Lancaster, immediately to return home, with the avowed object of maintaining his rights as Duke of Lancaster, but doubtless with a real design of a higher pitch. He landed with a few attendants at Ravenspurn in Yorkshire on the 4th of July, while Richard was in Ireland. The events that followed belong to the history of the reign of that king; it is sufficient to state here that Henry, who was immediately joined by the two powerful earls of Northumberland and Westmorland, carried everything before him, and the deposition of Richard having been pronounced by the parliament, was on the 30th of September solemnly acknowledged as king by the estates of the realm assembled in Westminster Hall. The commencement of his reign is reckoned from that day.

This change was undoubtedly in the highest degree acceptable to the great body of the people, among whom the vices and misgovernment of Richard had made him an object of hatred or contempt, while Henry of Lancaster had long been the idol of their affections and hopes. The new settlement was first disturbed by a plot of a few of the nobility, the lords who had appealed the Duke of Gloucester, and who for that act had now been deprived of the titles and estates they had received as the reward of their services from Richard. Their scheme to assassinate the new king however was detected in time, and when they afterwards flew to arms they were everywhere fallen upon and easily overpowered by the spontaneous loyalty of the people. A war with France, of which some apprehension was for a moment entertained, from the feelings naturally excited in the king and people of that country by the treatment of Richard II., who had lately married Isabella, the young daughter of Charles VI., was averted by the restoration of that princess. Military operations however speedily commenced on the side both of Wales and Scotland, in the former of which countries an insurrection, headed by the famous Owen Glendwr, baffled all Henry's efforts during several successive campaigns to put it down [GLENDRWR, OWEN]; while two Scottish armies, that marched across the borders, pretending that they came to restore king Richard, who, it was said, was still alive and resident at the northern court, were defeated, the first on the 22nd of June 1402, at Nesbet Moor, the second on the 14th of September, in the same year, in the much more destructive fight of Homildon Hill. The victorious commander in this last affair was Harry Percy, the renowned Hotspur, eldest son of the Earl of Northumberland, the nobleman to whom more than to any other individual Henry owed his throne. That great house, conscious of its power and its services, now broke with the king of its own making, on his refusal to permit the ransoming of Henry Percy's wife's brother, Sir Edmund Mortimer, who had been taken prisoner by Glendwr, and whom, as the uncle and natural guardian of the young Earl of March, the legitimate heir by lineal descent to the crown, Henry had his own reasons for wishing out of the way. [See the genealogical table in EDWARD IV.; but alter the line drawn from

Lionel, duke of Clarence, so as to fall upon Philippa, and not upon her husband, Edmund Mortimer, as there printed.] A most formidable rebellion followed, in which the Percies were joined by Hotspur's uncle the Earl of Worcester, and Scroop, archbishop of York, and leagued both with Owen Glendwr, who now gave his daughter in marriage to his prisoner Mortimer, and with the Scottish Earl Douglas, whom Percy liberated without ransom, on condition of his aiding them with all his power. The mighty confederacy however was annihilated, 21st of July 1403, by the battle of Shrewsbury, in which Henry Percy, the commander of the rebel force, was himself slain. This decisive victory established the throne of Henry of Lancaster. Some further hostilities with the Scots and the Welsh, the latter being assisted by a force from France, continued to give him occupation for two or three years longer; but before the end of 1405 Owen Glendwr was effectually put down, principally by the activity and military skill of Henry, prince of Wales, the eldest son of the English king, and a truce with Scotland had restored quiet for the present in that quarter. It was in the time of this truce that on the 30th of March 1405, an English cruiser captured the ship in which James, the eldest son of King Robert of Scotland, was proceeding to France, on which Henry retained possession of the young prince, who, becoming king the following year by the death of his father, remained a prisoner in England till 1424. About the same time Henry detected a conspiracy against his life, one of the principal persons engaged in which was his cousin Edward, duke of York, whose estates were immediately forfeited to the crown, and quelled another insurrectionary attempt of the Percies, headed by Scroop, archbishop of York, who expiated his treason by a death on the scaffold. A third northern insurrection, the last effort of the crafty old Earl of Northumberland, who had some years before been deprived of his estates and outlawed, was put down, 28th of February 1408, at the battle of Bramham Moor, near Tadcaster, in which the earl himself fell.

Meanwhile an irregular war with France, which had at first been carried on principally at sea, had led at last to some military operations in Guienne, where the English possessions were attacked by the French; and this involved Henry to a slight degree in the contest between the two great factions that then distracted France, the Bourguignons and the Orleansists, or Armagnacs. Having first sent a small body of troops to the assistance of the former in 1411, the next year he changed sides and entered into alliance with the latter, his principal object apparently being to keep up the anarchy which their quarrel occasioned; but these transactions led to no important national results during this reign.

In his latter years Henry, whose character the more it became known developed a harsher and more unamiable aspect, lost all the popular favour that had greeted his accession; and he had the unhappiness of seeing not only his chief friends transformed into enemies, but the affections of his subjects generally transferred to his son. To ill-health of body is also said to have been added remorse for many of the actions of his unscrupulous career, and especially for the means by which he had acquired a crown that sat so heavy on his brow, and which he superstitiously dreaded Heaven would not permit to be long worn by his descendants. He had endeavoured to soothe his conscience with the project of a crusade to the Holy Land, but death took him off before he could execute that design. He breathed his last on the 20th of March 1413, in the forty-seventh year of his age and the fourteenth of his reign.

By his first wife, Mary de Bohun, Henry IV. had the following children:—1, Henry, who succeeded him; 2, Thomas, born 1389, created earl of Albemarle and duke of Clarence 1411, died 1421; 3, John, created earl of Kendal and duke of Bedford, 1414, afterwards regent of France, died 1435; 4, Humphrey, created earl of Pembroke and duke of Gloucester 1414, died 1446; 5, Blanch, married successively to Lewis Barbatous, elector palatine and duke of Bavaria, to the king of Aragon and to the Duke of Bar; and 6, Philippa, married to Eric X., king of Denmark and Norway. By a second wife, Joanna, daughter of Charles II., king of Navarre, and widow of John V., duke of Brittany, whom he married in 1403, he had no issue.

Of the laws made in this reign the most memorable is the statute against the Lollards (the 2 Henry IV., c. 15), one of the enactments of which was that persons guilty of heresy, and refusing to abjure, or relapsing after abjuration, should be publicly burned. It is commonly supposed however that the writ 'De Hæretico Comburendo' was a common-law process before the passing of this statute. Several executions took place upon the new law in the course of the reign. In Henry's first parliament also the law of treason was brought back (by the 1st Henry IV., c. 10) to the state in which it had been placed by the act of the 25th of Edward III., certain new treasons created in the 21st year of the preceding reign being all repealed. The defects of Henry's title to the crown, and the repeated applications he was obliged to make to parliament for the means of putting down the insurrections by which the new settlement was assailed, had the effect of greatly enhancing the importance and power of the House of Commons under this king and the other Lancastrian princes.

HENRY V., surnamed of Monmouth, from the place of his birth, was the eldest son of king Henry IV., by his first wife, Mary de Bohun, and was born in the year 1388. He was educated at Queen's College, Oxford, under the superintendance of his half-uncle, the great

cardinal Henry Beaufort. When his father was in exile in 1399, he and a son of the late Duke of Gloucester were carried by king Richard to Ireland, and placed in custody in the castle of Trim, where they remained till the deposition of Richard. On his father's accession he was created prince of Wales, duke of Guienne, Lancaster, and Cornwall, and earl of Chester, and declared by act of parliament heir-apparent to the throne. He was introduced to arms, while yet only in his sixteenth year, at the battle of Shrewsbury, where, though severely wounded in the face, he fought gallantly to the close of the bloody day. Immediately after this he was sent to Wales in command of the army employed against Glendwr, and for some years he was occupied in the contest with that able and active leader, in the course of which he evinced extraordinary military genius, defeating his adversary in a succession of engagements,—in one of which, fought at Grosmont in Monmouthshire, in March 1405, he took his son Griffith prisoner,—and driving him from fastness to fastness, till all Wales, except a small part of the north, was reduced to submission. It is said that the renown and popularity the prince acquired by these successes so inflamed the jealousy of his father as to occasion his recall from the army, and that after this, allowing the energies of his ardent mind to run to waste in riotous intemperance and debaucheries, he drew upon himself as much reprobation and odium by his wild and dissipated life, as he had gained glory and favour among his countrymen by his previous conduct. The story of his being sent to prison by the lord chief-justice Sir William Gascoigne, for striking him in open court, and other accounts of his disorderly and reckless courses, are familiar to every reader. These anecdotes however are not recorded by the more ancient chroniclers, and do not appear to have found their way into our written history before the middle of the sixteenth century, though they may have floated among the people as traditions from a considerably earlier date. It is likely that they had some general foundation, though many or most of the details are probably fictitious.

Henry V. was proclaimed king on the 21st April 1413, the day after his father's death, amidst universal and enthusiastic joy. He began his reign with several acts of a generous stamp—transferring the remains of Richard II. to Westminster Abbey—releasing the young earl of March from the captivity in which he had been held all the preceding reign—and recalling the son of Hotspur from his exile in Scotland to be reinstated in his hereditary lands and honours. He had been seated on the throne little more than a year when, warmly supported by the church, the parliament, both Lords and Commons, and by the nation generally, he entered upon the enterprise of the conquest of France, which forms nearly the whole history of his reign. The claim which he advanced to the French crown was the same that had been put forward in the preceding century by Edward III., to whose rights he seems to have regarded himself as the legitimate successor in virtue of his possession of the throne, although he was certainly not the heir of that king by lineal descent, and this particular pretension was one that stood wholly upon descent by blood. After some time spent in negotiations with the French court, which led to no result, Henry, having appointed his brother, the Duke of Bedford, regent of the kingdom during his absence, set sail from Southampton, August 10, 1415, with a force of 24,000 foot and about 6500 cavalry, in a fleet of from 1200 to 1400 vessels, and reached the mouth of the Seine, about three miles from Harfleur, on the second day following. Three days were spent in disembarking the troops. Henry immediately proceeded to lay siege to the strong and well-garrisoned fortress of Harfleur. It capitulated after a siege of six weeks, in the course of which time however a dysentery that broke out in their camp made a frightful devastation among the English.

On the 6th of October Henry set out on his march through Normandy, with a force which at the utmost could not have exceeded 9000 men. On the 19th he succeeded in crossing the Somme by an unguarded ford between Betencourt and Voyenne; on the 24th he crossed the Ternois at Blangi, and then came in sight of a French army, commanded by the constable of France and the dukes of Orleans and Bourbon, the strength of which has been variously estimated at from 50,000 to 150,000 men. The great battle of Agincourt was fought on the next day, in which the English gained one of the most complete as well as wonderful victories on record [See AGINCOURT, in GEOGRAPHICAL DIVISION OF ENG. CYC.] Henry then marched to Calais, and embarked for England.

From his landing-place at Dover, where they rushed into the sea to meet him, all the way to London, which he entered on the 23rd of November, his progress was through a confluence of the people intoxicated with tumultuous joy. All seemed to feel that the victory of Agincourt was the conquest of France. But although no nation ever received so great a blow in a single field as France did on that fatal day—when a hundred and twenty of her greatest nobles fell, besides many more that were taken prisoners, including the dukes of Orleans and Bourbon, the commanders-in-chief in conjunction with the constable d'Albret, who was among the killed—it was not till after some years that, torn as she was by the most lamentable civil dissensions, and left nearly without a government, that unfortunate country at last consented to receive the yoke of her invader. Harfleur was attacked by the French the following August: but the

attempt was put an end to by a great naval victory gained by the duke of Bedford. In September Henry passed over to Calais, and there had a secret conference with the head of one of the great French factions, John, surnamed Sans-peur, duke of Burgundy, with whom there is no doubt that he came to some understanding about the employment of their united efforts for the destruction of the Orleansists, who now had the government in their hands. It was by thus politically taking advantage of the dissensions of his enemies, rather than by any further very brilliant military operations, that Henry at last achieved the conquest of France. He returned to that country in August 1417, having under his command a magnificent army of about 35,000 men. With this force he soon reduced the whole of Lower Normandy. He then laid siege to Rouen, 30th July 1418, and was detained before this town till after a brave resistance it capitulated on the 16th of January in the following year. By this time the duke of Burgundy had obtained the ascendancy in Paris and at the court of the incapable Charles and his profligate queen; and he was not now so much disposed as he had probably been two years before to aid the ambitious project of the English king. From Rouen Henry advanced upon Paris, on which Burgundy and the queen, taking the king with them, left that city, and went, first to Lagny, and afterwards to Provins. It was at last agreed however that a truce should be concluded between the English and the Bourguignons, and that Henry should meet the duke and the king and queen of France on the 30th of May. On that day the conference took place on the right bank of the Seine, near the town of Meulan. But after being protracted for above a month, the negotiation was suddenly broken off by the French party; and then it was discovered that the duke had concluded a treaty with the dauphin and the faction of the Armagnacs. On this Henry immediately resumed his advance upon Paris. Meanwhile the hollowness of the apparent reconciliation that had been hastily patched up between the two rival factions became abundantly manifest; the formal alliance of the chiefs had no effect in uniting their followers. At length, on the 10th of September, Burgundy having been induced to meet the dauphin on the bridge of Montreseau, was there foully fallen upon and murdered by the attendants, and in the presence, of the treacherous prince. From this time the Bourguignons, and even the people of Paris, who were attached to that party, looked upon the English as their natural allies against the dauphin and his faction. Philip, the young duke of Burgundy, and the queen in the name of her husband, immediately assented to all Henry's demands, which were—the hand of Charles's eldest daughter, the Princess Catherine, the present regency of the kingdom, and the succession to the throne of France on the death of Charles. It was also arranged that one of Henry's brothers should marry a sister of duke Philip. Several months were spent in the settlement of certain minor points; but at last the treaty of 'Perpetual Peace,' as it was styled, was completed and signed at Troyes by Queen Isabella and Duke Philip, as the commissioners of King Charles, on the 20th of May 1420; and on the following day the oath to observe it was taken without murmur or hesitation by the parliament, the nobility, and deputies from such of the commonalties as acknowledged the royal authority.

Henry's marriage with Catherine was solemnised on the 2nd of June. On the second day after he resumed his military operations, and some months were spent in reducing successively the towns of Sens, Montreseau, Villeneuve-le-Roi, and Melun. On the 18th of November, Henry and Charles entered Paris together in triumph, and here the treaty of Troyes was unanimously confirmed (December 10th) in an assembly of the three estates of the kingdom. Henry soon after set out with his queen for England, and on the 2nd of February 1421 entered London amidst such pageants and popular rejoicings as that capital had never before witnessed.

He did not however remain long at home. On the 22nd of March his brother, the Duke of Clarence, whom he had left governor of Normandy, was defeated in a battle fought at Baugé, in Anjou, by a force chiefly composed of a body of Scottish auxiliaries under the Earl of Buchan, who slew Clarence with his own hand, an exploit for which the dauphin conferred upon the Scottish earl the office of Constable of France. This victory appears to have produced a wonderful effect in reanimating the almost broken spirits and extinguished hopes of the dauphin's party. Feeling that his presence was wanted in France, Henry again set sail for Calais in the beginning of June, taking with him a Scottish force commanded by Archibald, earl of Douglas, and also his prisoner, the Scottish king, to whom he promised his liberty as soon as they should have returned to England. His wonted success attended him in this new expedition; and he drove the dauphin before him, from one place after another, till he forced him to retire to Bourges, in Berry. He then, after taking the strong town of Meaux, which cost him a siege of seven months, proceeded to Paris, which he entered with great pomp on the 30th of May 1422, accompanied by his queen, who had come over to join him, after having given birth to a son at Windsor Castle on the 6th of the preceding December. But the end of Henry's triumphant career was now at hand. The dauphin and the constable Buchan having again advanced from the south, and laid siege to the town of Cosne, Henry, though ill at the time, set out to relieve that place, but was unable to proceed farther than Corbeil, about 20 miles from Paris when, resigning the command to his

brother the Duke of Bedford, he was carried back in a litter to the Bois de Vincennes, in the vicinity of the capital, and there, after an illness of about a month, he breathed his last, on the 31st of August, in the thirty-fourth year of his age and the tenth of his reign.

It is unnecessary in the present day to waste a word on either the injustice or the folly of the enterprise on which Henry thus threw away the whole of his reign. In estimating his character, it is of more importance to remember that the folly and injustice, which are now so evident, were as little perceived at that day by his subjects in general as by himself, and that there can be no doubt whatever that both he and they thought he was, in the assertion of his fancied rights to the crown of France, pursuing both a most important and a most legitimate object. That motives of personal ambition mingled their influence in his views and proceedings must no doubt be admitted; but that is perfectly consistent with honesty of purpose and a thorough belief in the rightness both of the object sought and the means employed to secure it. In following the bright though misleading *idea* that had captivated him, he certainly displayed many endowments of the loftiest and most admirable kind—energy, both of body and mind, which no fatigue could quell; the most heroic gallantry; patience and endurance, watchfulness and activity, steadiness, determination, policy, and other moral constituents, as they may be called, of genius, as well as mere military skill and resources. Nor does any weighty imputation dim the lustre of these virtues. His slaughter of his prisoners at the battle of Agincourt, almost the only stigma that rests upon his memory, was an act of self-preservation justified by what appeared to be the circumstances in which he was placed. No monarch ever occupied a throne who was more the idol of his subjects than Henry V.; nor is any trace to be found of popular dissatisfaction with any part of his government from the beginning to the end of his reign.

HENRY VI., surnamed of Windsor, was born there on the 6th of December 1421, being the only issue of Henry V. by his queen the Princess Catherine of France. He was consequently not quite nine months old when the death of his father left him king of England. His reign is reckoned from the 1st of September 1422, the day following his father's death.

In the settlement of the government which took place upon the accession of the infant king, the actual administration of affairs in England was entrusted to the younger of his two uncles, Humphrey, popularly called the Good, duke of Gloucester, as substitute for the elder, John, duke of Bedford, who was appointed president of the council, but who remained in France, taking his late brother's place as regent of that kingdom. Gloucester's title was Protector of the Realm and Church of England. The care of the person and education of the king was some time after committed to Richard de Beauchamp, earl of Warwick, and to the king's great-uncle, Bishop (afterwards cardinal) Henry Beaufort.

The history of the earlier and longer portion of this reign is the history of the gradual decay and final subversion of the English dominion in France. The death of Henry V. was followed in a few weeks (October 22nd) by that of his father-in-law, the imbecile Charles VI. Immediately on this event the dauphin was acknowledged by his adherents as Charles VII.; and Henry VI. was also proclaimed in Paris, and wherever the English power prevailed, as king of France. The next events of importance that occurred were the two great victories of Crevant and Verneuil obtained by the English over the French and their Scottish allies, the former on the 31st of July 1423, the latter on the 17th of August 1424. In the interim, King James of Scotland, after his detention of nearly twenty years, had been released by the English council, and had returned to his native country after marrying a near connection of the royal family, the Lady Jane Beaufort, daughter of the Duke of Somerset. One of the engagements made by James on his liberation was that he should not permit any more of his subjects to enter into the service of France; the Scots who were already there were for the most part destroyed a few months afterwards in the slaughter of Verneuil.

This however was the last great success obtained by the English in France. From this time their dominion began to loosen and shake, and then to crumble faster and faster away, until it fell wholly to ruin. The first thing which materially contributed to unsettle it was the disgust given to the Duke of Burgundy by the marriage of the Duke of Gloucester with Jacqueline of Hainault, and their subsequent invasion and seizure of her hereditary states, then held by her former husband John, duke of Brabant, who was the cousin of the Duke of Burgundy. Although Burgundy, on being left to pursue his quarrel with Jacqueline, whom he soon succeeded in crushing, after she had been abandoned by Gloucester, did not go to the length of openly breaking with the English on account of this matter, his attachment was never afterwards to be much relied upon, and he merely waited for a favourable occasion to change sides. Meanwhile another of the most powerful of the English allies, the Duke of Brittany, openly declared for Charles VII. Other embarrassments also arose about the same time out of the mutual jealousies and opposition of Gloucester and Bishop Beaufort, which at last blazed up into open and violent hostility. It required all the moderating prudence and steadiness of the Duke of Bedford to break as much as possible the shock of these various adverse occurrences. For some years accordingly he had

enough to do in merely maintaining his actual position. It was not till the close of 1428 that he proceeded to attempt the extension of the English authority beyond the Loire. With this view the siege of Orleans was commenced on the 12th of October in that year by the Earl of Salisbury, and, on his death from a wound received a few weeks after, carried on by the Earl of Suffolk. The extraordinary succession of events that followed—the appearance of Joan of Arc on the scene; her arrival in the besieged city (April 29th, 1429); the raising of the siege (May 8th); the defeat of the English at the battle of Patay (June 18th); the coronation of King Charles at Rheims (July 15th); the attack on Paris (September 12th); the capture of Joan at Compiègne (May 25th, 1430); her trial and execution at Rouen (May 30th, 1431)—all belong to the singular story of the heroic maid. [ARC, JOAN OF.]

The young king of England, now in his ninth year, had in the mean time been brought to Rouen (May, 1430), and was about a year and a half afterwards solemnly crowned at Paris (17th of December, 1431). The death of the Duchess of Bedford, the sister of the Duke of Burgundy, in November 1432, and the marriage of Bedford in May of the following year with Jacquetta of Luxembourg, aided materially in still further detaching Burgundy from the English connection, till, his remaining scruples gradually giving way under his resentment, in September 1435, he concluded a peace with king Charles. This important transaction was managed at a great congress of representatives from all the sovereign powers of Europe assembled at Arras, with the view of effecting a general peace under the mediation of the pope. On the 14th of September, a few days after the treaty between Charles and Burgundy had been signed, but before it was proclaimed, died the great Duke of Bedford. This event gave the finishing blow to the dominion of the English in France. In April 1436 the English garrison in Paris was compelled to capitulate. The struggle lingered on for about fifteen years more; but although some partial successes, and especially the brilliant exertions of the famous Talbot (afterwards Earl of Shrewsbury), in Normandy and elsewhere, gave a check from time to time to the progressive dissolution of the English power, the prevailing current of events ran decidedly in the contrary direction. In 1444 a truce was agreed upon, to last till the 1st of April 1446; and in this interval a marriage was arranged between king Henry and Margaret, the beautiful daughter of René, king of Sicily and Jerusalem, and duke of Anjou, Maine, and Bar. These lofty dignities however were all merely titular; with all his kingdoms and dukedoms, René was at this time nearly destitute both of land and revenue. Thus circumstanced, in return for the hand of his daughter, he demanded the restoration of his hereditary states of Maine and Anjou, which were in the possession of the English, and the proposal was at length assented to. Nor was this cession of territory the only thing that tended from the first to excite popular feeling in England against the marriage. Margaret was a near relation of the French king, and had been in great part brought up at the court of Charles. The connection therefore seemed to be one thoroughly French in spirit, and it is no wonder that the Earl of Suffolk, by whom it had been negotiated, became from this time the object of much general odium and suspicion, the more especially when it was found that Margaret, who soon evinced both commanding talent and a most imperious temper, distinguished him by every mark of her favour, and made him almost exclusively her confidential adviser and assistant in winding to her purposes her feeble and pliant husband. The marriage was solemnised in the abbey of Tichfield, 22nd of April 1445, Suffolk having a few months before, on the conclusion of the negotiations, been created a marquis. The truce with France was now prolonged till the 1st of April 1449. The first remarkable event that followed was the destruction of the Duke of Gloucester, who, although he appears not to have openly opposed the marriage, was certainly the most formidable obstacle in the way of the complete ascendancy of Suffolk and the queen. Having been arrested on a charge of high treason, 11th of February 1447, he was on the 28th of the same month found dead in his bed. In the popular feeling, his death was generally attributed to the agency of Suffolk, who now, raised to the dignity of duke, became, ostensibly as well as really, prime or rather sole minister.

Soon after hostilities were renewed in France, and a numerous force having been poured by king Charles into Normandy, through the adjacent country of Maine, no longer a hostile frontier, town after town was speedily reduced, till at last Rouen, the capital, surrendered, 4th of November 1449. Early in the next year another heavy reverse was sustained in the defeat of Sir Thomas Kyriel at Fournigny; and at last the fall of Cherbourg, 12th of August 1450, completed the loss of the duchy. Before this catastrophe however the public indignation in England had swept away the unhappy minister on whose head all this accumulation of disasters and disgraces was laid; the Duke of Suffolk, after having been committed to the Tower, on the impeachment of the House of Commons, and banished from the kingdom by the judgment of his peers, was seized as he was sailing across from Dover to Calais, and being carried on board one of the king's ships, was there detained for a few days, and at last had his head struck off by an executioner who came alongside in a boat from the shore, May 2nd, 1450. The death of Suffolk was immediately followed by a popular insurrection, unparalleled in its extent and violence since

the rebellion of Wat Tyler, seventy years before. [CADE, JOHN.] Before the close of the following year the French, in addition to Normandy, had recovered all Guienne; and with the exception of Calais, not a foot of ground remained to England of all her recent continental possessions. Bordeaux, which had been subject to the English government for three centuries and a half, revolted the following year; and the brave Talbot, now eighty years of age, was sent to Guienne to take advantage of that movement; but both he and his son fell in battle, 20th of July 1453; and on the 10th of October following Bordeaux surrendered to Charles.

The remainder of the history of the reign of Henry VI. is made up of the events that arose out of the contest for the crown which eventually placed another family on the throne. [EDWARD IV.] It is only necessary here to enumerate in their chronological order the leading facts in the story of Henry's personal fortunes. On the 13th of October 1453 Queen Margaret was delivered at Westminster of a son, who was named Edward, and early in the next year, according to custom, created Prince of Wales and Earl of Chester. About the same time the king sunk into a state of mind amounting to absolute incapacity. By the beginning of the year 1455 however he had recovered such use of his faculties as he had formerly had, and again took upon him the nominal administration of the government, which during his malady had been committed to the Duke of York. In the contest of arms that soon ensued, he was taken prisoner by the Earl of Warwick at St. Albans, 23rd of May 1455, and towards the end of that year he was again declared to be in a state of incapacity, and the Duke of York resumed the management of affairs with the title of protector. Again however in a few months Henry recovered his health, and the government was conducted in his name till his second capture by the young Earl of March (afterwards Edward IV.) at Northampton, 10th of July 1460. On this occasion the queen escaped with her son, and eventually made her way to Scotland. The victory obtained by Margaret over the Earl of Warwick at Barnet Heath, 17th of February 1461, again liberated her husband; after which, and the issue of the battle of Towton, 29th of March, which established Edward on the throne, he retired with the queen and Prince Edward to Scotland. When Margaret again took up arms and invaded England in 1462, Henry was placed for security in the castle of Hardlough in Merionethshire; and here he remained till the spring of 1464, when he was brought from Wales to join a new insurrection of his adherents in the north of England. After the two final defeats of the Lancastrians at Hedgley Moor, 25th of April, and at Hexham, 15th of May, the deposed king lurked for more than a year among the moors of Lancashire and Westmorland, till he was at last betrayed by a monk of Addington, and seized as he sat at dinner in Waddington Hall in Yorkshire, in June 1465. He was immediately conducted to London and consigned to the Tower, where he remained in close confinement, till the extraordinary revolution of October 1470 again restored him, for a few months, to both his liberty and his crown. He was carried from London to the battle of Barnet, fought 14th of April 1471, and there fell into the hands of Edward, who immediately remanded him to his cell in the Tower. The old man survived the final defeat of his adherents, and the death of his son at Tewkesbury, 4th of May; and a few days after an attempt, which had nearly succeeded, was made by Thomas Nevil, called the Bastard of Falconberg, to break into his prison and carry him off by force. This probably determined Edward to take effectual means for the prevention of further disturbance from the same quarter. All that is further known is that on Wednesday the 22nd the dead body of Henry was exposed to public view in St. Paul's. Generally however it has been believed that he was murdered, and that his murderer was the king's brother, the Duke of Gloucester, afterwards Richard III. Henry VI. was after his death revered as a martyr by the Lancastrians, and many miracles were reported to have been wrought at his tomb. An attempt was made in the next century by his successor Henry VII. to prevail upon Pope Julius II. to canonise him; the pope referred the matter to the examination of the archbishop of Canterbury and the bishops of London, Winchester, and Durham; but it came to nothing. "The general opinion was," says Bacon ('Life of Henry VII.'). "that Pope Julius was too dear, and that the king would not come to his rates. But it is more probable that that pope, who was extremely jealous of the dignity of the see of Rome, and of the acts thereof, knowing that king Henry VI. was reputed in the world abroad but for a simple man, was afraid it would but diminish the estimation of that kind of honour, if there were not a distance kept between innocents and saints."

HENRY VII. was born at Pembroke Castle on the 21st of January 1456. His father was Edmund Tudor, surnamed of Hadham, who had been created Earl of Richmond in 1452, being the son of Sir Owen Tudor and Queen Catherine, widow of Henry V. He was thus paternally descended both from the royal house of France and also, it is said, from the ancient sovereigns of Wales, for such is the derivation assigned by the genealogists to the Tudors. But it was his maternal extraction that gave Henry Tudor his political importance. His mother was Margaret, the only child of John Beaufort, duke of Somerset, whose father of the same name was the eldest of the sons of John of Gaunt, duke of Lancaster, the root of the Lancastrian house, by his third wife, Catherine Swynford. The Beauforts, as the children

of Gaunt by this wife were named, having been born before marriage, and only subsequently legitimated by a patent entered on the rolls of parliament, which appears (though there is some doubt as to that point) not to have opened to them the succession to the crown, were not at first looked upon as in themselves or their descendants forming strictly a branch of the House of Lancaster; their name itself distinguished them as another family. But towards the close of the reign of Henry VI. their royal descent and proximity to the throne began to be spoken of as giving them important pretensions. After the termination of the wars of the Roses, the Somerset family remained the only representatives of the House of Lancaster in England: there were indeed in Portugal, Spain, Germany, and Denmark, nearly a dozen descendants of the daughters of John of Gaunt by his two earlier marriages, some of whom at least, namely, those sprung from Henry IV., had clearly a prior place in the line of succession to the Beauforts, had the legitimation of the latter been ever so perfect; but the circumstances of the time were not such as to allow any validity to these foreign titles. After Richard III. obtained the throne, only two really formidable members of the House of Lancaster survived, namely, this Henry, earl of Richmond, and Henry, duke of Buckingham, whose mother was also a Margaret Beaufort, a great-grand-daughter of John of Gaunt. But her father was a younger brother of the father of the Countess of Richmond, whose son therefore undoubtedly stood first in the line of the family succession.

Edmund Tudor, earl of Richmond, died in 1456, the same year in which his son Henry was born. Throughout the stormy period that followed the child found a protector in his uncle Jasper Tudor, earl of Pembroke, till on the accession of Edward IV., in 1461, the earl was attainted and obliged to fly the country. Henry appears to have been then consigned by the new king to the charge of Sir William Herbert, baron Herbert (afterwards created Earl of Pembroke), and to have been carried by that nobleman to his residence of Raglan Castle in Monmouthshire. Long afterwards he told the French historian Comines that he had been either in prison or under strict surveillance from the time he was five years of age. He is said however to have been brought to court on the restoration of Henry VI. in 1470, and it is to this date that the story is assigned of his having been prophetically pointed out by Henry as the person that was to bring to a close the contest between the two houses. It must have been at this time also that he was sent to Eton, if he ever really studied, as is reported by some, at that school. After the battle of Tewkesbury he seems to have been sent back to Raglan Castle, and to have remained there till his uncle, who had fled to France, returned secretly, and found means to carry him off to his own castle of Pembroke. Upon this Edward immediately took measures to recover possession of the boy, but his uncle at last contrived to embark with him at Tenby, with the intention of proceeding to France. They were forced however by stress of weather to put into a port of Bretagne, and there they were detained by the duke, Francis II. But although this prince would not suffer them to pursue their journey, he allowed them an honourable maintenance, and as much liberty as was consistent with his design that they should not pass out of his dominions, nor although repeatedly importuned by King Edward to deliver them up would he ever listen to the proposal. Henry continued resident in these circumstances in the town of Vannes in Bretagne till after the accession of Richard III.

As soon as it came to be known that Edward V. and his brother no longer existed, a fact which Richard III. himself took pains to publish, without any attempt to make it appear that they had not been taken off by violence, the minds of men turned to the young Earl of Richmond as the most eligible opponent to set up against the actual possessor of the crown. Morton, bishop of Ely, afterwards archbishop of Canterbury and cardinal, has the credit of having first suggested to the heads of his party, that the crown should be offered to Henry on condition of his engaging to espouse the Princess Elizabeth, daughter of Edward IV., and since the death of her brothers the undoubted heiress of the rights of the House of York. The scheme received the assent of the leaders of the various interests already confederated against Richard—of the queen dowager, of her son the Marquis of Dorset, and of the Duke of Buckingham, whatever were the motives that had induced the last-mentioned nobleman to make his sudden change from the one side to the other. Communications were immediately entered into with Henry's mother the Countess of Richmond, and she also entered cordially into the design, although her present husband Lord Stanley had all along steadily adhered to Richard, with whom he at present was. A messenger was now despatched to Henry in Bretagne, September 24, 1483, and he was informed that the general rising in his favour would take place on the 18th of October. The issue of this first attempt was eminently disastrous to the confederacy of the earl's friends. Henry sailed from St. Malo with a fleet of forty sail, which he had been enabled to provide partly by the assistance of the Duke of Bretagne; but a storm dispersed his ships as he crossed the Channel, and when he reached the English coast near Poole he deemed it prudent, with the insufficient force that he had remaining, not to land. Meanwhile the hasty, ill-combined revolt of Buckingham and his associates fell to pieces without the striking of a blow. Buckingham himself was taken and executed as a traitor; of the other chief persons engaged in the

attempt, several underwent the same fate; others escaped death by flight; many were attainted, among the rest the Countess of Richmond, whose life was only spared at the intercession of her husband Lord Stanley. Henry himself returned to Bretagne, and there at Christmas, in the presence of a meeting of the English exiles to the number of 500, held in the cathedral of Rhedon, he solemnly swore to marry Elizabeth as soon as he should have triumphed over the usurper, and in return the assembly promised him fealty on that condition, and did him homage as their sovereign. A few months after this however Henry and his friends found it expedient to withdraw from Bretagne to avoid the machinations of the duke's minister Landois, who had been gained over by Richard, and had prevailed upon the duke to take measures for betraying them to the English king. They succeeded in making their escape to the territory of the French king, where they spent another year in making preparations for a new expedition under the countenance and with the assistance of the king, Charles VIII. At length, on the 1st of August 1485, Henry sailed with his fleet from Harfleur, and on the 7th landed at Milford-Haven in Wales. The two rivals encountered at Bosworth in Leicestershire, on the 22nd, when the result was that Henry obtained a complete victory, which, with the death of Richard, who fell in the battle, at once placed the crown on his head. This was afterwards reckoned the first day of his reign, an arrangement by which only those who had actually drawn their swords against him at Bosworth were made to be guilty of treason, and whatever acts had been done in the service of the usurper (as Richard was considered) up to the eve of that battle were overlooked. [RICHARD III.]

Henry's marriage with Elizabeth was not solemnised till the 18th of January 1486, before which time it had been enacted by the parliament that "the inheritance of the crown should be, rest, remain, and abide in the most royal person of the then sovereign lord King Henry VII., and the heirs of his body lawfully coming, perpetually with the grace of God so to endure, and in none other;" the only security taken for the marriage being a request subsequently presented to the king by the Commons along with the grant of tonnage and poundage for life, that he would be pleased "to take to wife and consort the Princess Elizabeth," with which, after it had been formally concurred in by the lords spiritual and temporal, Henry intimated that he was willing to comply. It has been usually asserted that Henry throughout their union treated his queen with marked coldness and neglect. He must have felt indeed that he owed nothing to any preference that had been shown for him by a woman who was equally ready to give her hand to his deadliest enemy, had the fortune of the contest been different; but it would appear that, from policy, if not from affection, he latterly behaved to her with more attention than he had at first shown; and there is even some evidence that their domestic intercourse came at length to breathe more cordiality and tenderness than has been generally supposed.

It was not to be expected that a reign commencing in such circumstances should be undisturbed by insurrectionary attempts. A succession of such movements kept Henry in disquietude for many years. The first that occurred was that headed by Francis, viscount Lovel, in April 1486, which was speedily and effectually put down. Before the end of the same year however a new and more formidable commotion was excited by the imposture of the boy Lambert Simnel, the son of a joiner at Oxford, who was put forward as Edward Plantagenet, earl of Warwick, the son and heir of the late Duke of Clarence, brother of Richard III. The young prince in question had, in fact, been lodged in the Tower by Henry among the first acts of his reign, and he remained immured in that fortress while the person who had assumed his name was receiving royal honours in Ireland as Edward VI. Simnel was soon joined both by Lord Lovel, who had made his escape from the recent disturbance, and by John de la Pole, earl of Lincoln, whose mother was a sister of Edward IV., and who had been at one time declared heir to the crown by the late king after the death of his own son. The Duchess of Burgundy, another sister of Edward IV., also gave her countenance and effective aid to the enterprise of the pretender, whom probably the friends of the House of York merely intended to make use of for effecting their first object, the ejection of the present king. The brief royalty of Simnel however was terminated June 16, 1487, by the defeat of his adherents in the battle of Stoke, in which Lincoln himself was slain. The imposture of Simnel was followed after some years by the appearance of the more celebrated pretender Perkin Warbeck, who was asserted by his adherents to be Richard, duke of York, the younger brother of Edward V., and generally supposed to have been murdered along with him in the Tower. Warbeck arrived in Ireland from Lisbon in the beginning of May 1492, and was afterwards acknowledged as Duke of York, or rather as Richard, king of England, not only by the Duchess of Burgundy, but by the governments both of France and Scotland. This affair occupied Henry for the next five or six years; for it was not till the end of 1497 that the adventurer was finally put down. Another pretended Earl of Warwick next arose, one Ralph Wulford, or Wilford, the son of a shoemaker, whose attempt however was immediately nipped in the bud by his apprehension and execution, in March 1499. The restless succession of these conspiracies seems at last to have convinced Henry that his throne would never be secure, nor the kingdom at peace, until the persons who were made rallying-points by his enemies were put

out of existence. The same year in which Wulford was put to death witnessed the executions of both Perkin Warbeck and the Earl of Warwick. From this time Henry's reign was one of complete internal tranquillity, of which he chiefly took advantage to augment his revenue and his hoarded treasures—extracting money from his subjects on all sorts of pretences, which were not the less oppressive for being generally legal in their form and colour. The English law at this time, if only stretched as far as it would go, was abundantly sufficient for the purposes of the most exorbitant tyranny. The chief instruments of Henry's rapacity were two lawyers, Sir Richard Empson and Edmund Dudley, names immortalised by the detestation of their country.

Henry was early in his reign involved in the politics of the Continent by the quarrel which arose between Francis, duke of Bretagne, and Charles VIII. of France, with both of whom he had been connected before he came to the throne, and each of whom applied to him for his assistance. This quarrel, by the death of Francis soon after it broke out, leaving only two daughters, one of whom also soon afterwards died, became in fact a contest for the possession of Bretagne on the part of France. This was an object to which the public mind in England was strongly opposed; but although Henry was forced to appear to go along with the national feeling, he deferred taking any steps to prevent the subjugation of the Bretons till it was too late. The money that was eagerly voted by parliament to fit out an expedition he collected very carefully, but instead of fighting he endeavoured to manage the matter by the cheaper method of negotiation. Afterwards indeed, in the spring of 1489, he found himself compelled to equip a small force, which proceeded to Bretagne; but he had previously assured the French government that if the troops were sent they should act only on the defensive, an engagement which was faithfully kept. Charles eventually compelled the Duchess of Bretagne to marry him, after she had been affianced to Maximilian, the King of the Romans; and the duchy was thus finally annexed to the French crown. The indignation in England at this result forced Henry to conduct an army to France in person, in the beginning of October 1492; but he had already secretly arranged a peace with Charles, and before there was any fighting the treaty was published in the beginning of November. By this treaty, called the Treaty of Estaples, Charles bound himself to pay Henry the sum of 149,000*l.* sterling, in half-yearly instalments. In 1496, notwithstanding this peace, Henry joined the league of the pope, the King of the Romans, the King of Castile, the Duke of Milan, and the republic of Venice, which, after Charles had overrun the kingdom of Naples in 1494, had in a few months expelled him from his sudden conquest; but when Charles died in 1498, the Treaty of Estaples was renewed with his successor Louis XII., and continued to regulate the relations of the two kingdoms to the end of the reign.

By successive truces with James III. and James IV., the peace with Scotland was preserved till 1495, when, on the recommendation of the French king and the Duchess of Burgundy, Perkin Warbeck was received in that kingdom as the rightful heir of the English crown. King James not only assisted the adventurer with money and troops, but gave him in marriage the Lady Catherine Gordon, a relation of his own. After Warbeck's final discomfiture however in 1497, a new truce was concluded between the two countries, to last till the expiration of a year after both kings should be dead; and this led in 1502 to a treaty of perpetual peace, cemented by the marriage of James with Henry's eldest daughter, the princess Margaret. This marriage, from which flowed, after the lapse of a century, the important political result of the union of the two crowns, was solemnised at Edinburgh on the 8th of August 1503.

Nearly two years before this, namely, November 14th 1501, a marriage, long contemplated and agreed upon, had been solemnised between Henry's eldest son Arthur, prince of Wales, and Catherine, the fourth daughter of Ferdinand, king of Castile. Arthur however, who was a prince of the highest promise, died within six months after this time; and then it was arranged that Catherine should be married to his surviving brother Henry. The marriage of Catherine and Arthur proved still more momentous in its consequences than that of Margaret and James.

Queen Elizabeth died on the 11th of February 1503, a few days after giving birth to a daughter; on which Henry lost no time in proceeding to turn his widowhood to account in the acquirement of some political advantage, or in the augmentation of his riches, now his ruling passion, by means of a new matrimonial alliance. One disappointment after another however met him in this pursuit, and after having first made application to the widow of the King of Naples; then concluded a treaty with the Archduke Philip, husband of Joanna, queen of Castile, for the hand of his sister Margaret, widow of the Duke of Savoy; and finally, on the death of Philip in September 1506, once more changed his ground, and proposed himself as the husband of Philip's widow, the Queen Joanna, who was insane—he died before he could accomplish his object. His death took place at Richmond, as the royal palace at Sheen was now called, on the 22nd of April 1509, in the twenty-fourth year of his reign and the fifty-third of his age.

The children of Henry VII. by his queen, Elizabeth of York, were—1, Arthur, born September 20th 1486, created Prince of Wales 1489, married to Catherine of Spain (to whom he had been contracted eleven years before), November 14th 1501, died at Ludlow Castle April 2nd

1502; 2, Margaret, born November 29th, 1489, married to King James IV. of Scotland, August 8th, 1503, died 1539; 3, Henry, who succeeded his father as Henry VIII.; 4, Elizabeth, born July 2nd, 1492, died September 14th, 1495; 5, Mary, born 1498, married to Louis XII. of France, November 5th, 1514, and secondly in 1515 to Charles Brandon, duke of Suffolk, died June 25th, 1533; 6, Edmund, born February 21st, 1499, soon after created Duke of Somerset, died in infancy; 7, Edward, born February 1500, died young; and, 8, Catherine, born February 2nd, 1503, died a few days after her mother.

Bacon, in his striking and masterly 'History of the Reign of Henry VII.,' has drawn this king as a hero of policy and craft, who may almost compete with the 'Principe' of Macchiavel, if we make allowance for the greater ruthlessness and more sanguinary spirit natural to the Italian blood. It may be admitted that this great writer, in the elaboration of his design, has been drawn into some degree of exaggeration or over-refinement; and he has probably also softened the more repulsive features in Henry's moral character, as much as he has unduly exalted his intellectual endowments. But the difficult position which he occupied, and the success with which he maintained himself in it, vindicates the title of this sovereign to be regarded as at least one of the greatest masters of kingcraft that figure in history. Bacon compares him, justly enough, to Louis XI. of France and Ferdinand of Spain, designating the three as "the *tres magi* of kings of those ages." The age in which Henry lived was that of the birth of modern policy, and that in which the foundations were laid of the still enduring system of the European states. This reign therefore may be considered as the beginning of the modern history of England.

HENRY VIII., the second son of Henry VII. by his queen, Elizabeth of York, was born at Greenwich on the 28th of June 1491. On the 1st of November following he was created Duke of York, and in 1494 his father conferred upon him the honorary title of Lord-Lieutenant of Ireland, Sir Edward Poyning being appointed his deputy. The government of Sir Edward is famous for the enactment of the statute, or rather series of statutes, declaring the dependence of the Irish parliament upon that of England, which passes under his name. Henry's nominal lord-lieutenancy appears to have lasted only till the next year, when he exchanged that dignity for the office of President of the Northern Marches. The king's design in these appointments seems to have been to oppose his son's name to the pretensions of Perkin Warbeck, and the efforts of the supporters of that adventurer, first in Ireland and afterwards from the side of Scotland. Although thus early distinguished by these and other civil titles and appointments, it is stated by Paolo Sarpi, in his 'History of the Council of Trent,' that Henry was from the first destined to the archbishopric of Canterbury: "that prudent king, his father," observes Lord Herbert (in the 'History of his Life and Reign'), "choosing this as the most cheap and glorious way for disposing of a younger son." He received accordingly a learned education; "so that," continues this writer, "besides his being an able Latinist, philosopher, and divine, he was (which one might wonder at in a king) a curious musician, as two entire masses composed by him, and often sung in his chapel, did abundantly witness." As the death of his elder brother Arthur however, on the 2nd of April 1502, made him heir to the crown before he had completed his eleventh year, it is evident that his clerical education could not have proceeded very far, and that what he knew either of divinity or the learned tongues must have been for the most part acquired without any view to the church. There is a contradiction in the statements as to the time when he was created Prince of Wales; but there is a patent in Rymer (vol. xiii., p. 11) appointing him warden of the forest of Gualtres in Yorkshire by this title, June 22nd 1502, within three months after his brother's death. This is consistent with what we are told by Holinshed, who, after relating the death of Arthur, says—"his brother, the Duke of York, was stayed from the title of prince by the space of a month, till to women it might appear whether the Lady Catherine, wife to the said Prince Arthur, was conceived with child or not."

Very soon after Arthur's death the singular project was started of marrying Henry to his brother's widow. The proposition appears to have originally come from Ferdinand and Isabella, the parents of the princess, who were anxious to retain the connection with England; and to have been assented to by King Henry in great part from his wish to avoid the repayment of the dower of the princess. The final agreement between the two kings was signed on the 23rd of June 1503, and, according to the chroniclers, the parties were affianced on Sunday the 25th of the same month, at the Bishop of Salisbury's house in Fleet Street, although the dispensation was certainly not obtained from Pope Julius II. till the 26th of December following. This bull however contains a clause legitimatising the marriage, although it should have been already contracted, or even consummated. It may be observed that nobody at this time seems to have doubted that Catherine's preceding marriage with Arthur had been followed by consummation.

Henry became king on the 22nd of April 1509, being then in his nineteenth year. On a memorial being presented by the Spanish ambassador, it was, notwithstanding the opposition of Warham, archbishop of Canterbury, resolved in the council that the marriage with Catherine should be completed; Fox, bishop of Winchester, strongly

urging, among other reasons, "that there was no room to doubt that the princess was still a virgin, since she herself affirmed it, offering even to be tried by matrons, to show that she spoke the truth." The marriage was accordingly solemnised in the beginning of June.

Henry was indebted for the warm and general gratulation with which his accession was hailed by his subjects, partly to his distinguished personal advantages and accomplishments, and to some points of manner and character adapted to take the popular taste; partly to the sense of relief produced by the termination of the austere and oppressive rule of his predecessor. One of the earliest proceedings of the new reign was the trial and punishment of his father's ministers, Dudley and Empson. They were indicted for a conspiracy to take possession of London with an armed force during the last illness of the late king, and being convicted on this charge, and afterwards attainted by parliament, were, after lying in jail for about a year, beheaded together on Tower Hill on the 17th of August 1510.

Henry had not been long upon the throne when he was induced to join what was called the Holy League, formed against France by the pope, the emperor, and the King of Spain. A force of 10,000 men was sent to Biscay under the Earl of Dorset, in the spring of 1512, to co-operate with an army promised by Ferdinand for the conquest of Guienne; but the Spanish king, after dexterously availing himself of the presence of the English troops to enable him to overrun and take possession of Navarre, showed plainly that he had no intention of assisting his ally in his object; and after having had his ranks thinned, not by the sword, but by disease, Dorset was compelled by discontents in his camp, which rose at last to actual mutiny, to return to England before the end of the year, without having done anything. The next year Henry passed over in person to France with a new army, and having been joined by the Emperor Maximilian, defeated the French on the 4th of August, at Guinegate, in what was called the Battle of the Spurs, from the unusual energy the beaten party are said to have shown in riding off the ground, and took the two towns of Terouenne and Tournay. On the 9th of September also the Scottish king, James IV., who as the ally of France had invaded England, was defeated by the Earl of Surrey in the great battle of Flodden, he himself with many of his principal nobility being left dead on the field. This war with France however was ended the following year by a treaty, the principal condition of which was that Louis XII., who had just lost his queen, Ann of Bretagne, the same who had been in the first instance married to his predecessor, Charles VIII. [HENRY VII.], should wed Henry's sister, the Princess Mary. The marriage between Louis, who was in his fifty-third, and the English princess, as yet only in her sixteenth year, was solemnised on the 9th of October 1514; but Louis died within three months, and scarcely was she again her own mistress when his young widow gave her hand to Charles Brandon, duke of Suffolk, an alliance out of which afterwards sprang a claim to the crown. [GREY, LADY JANE.]

The members of Henry's council, when he came to the throne, had been selected, according to Lord Herbert, "out of those his father most trusted," by his grandmother, the Countess of Richmond, "noted to be a virtuous and prudent lady." A rivalry however and contest for the chief power soon broke out between Richard Fox, bishop of Winchester, secretary and lord privy seal, and Thomas Howard, earl of Surrey (afterwards duke of Norfolk), who held the office of lord treasurer. This led to the introduction at court of the famous Thomas Wolsey, who, being then Dean of Lincoln, was brought forward by Fox to counteract the growing ascendancy of Surrey, and who speedily made good for himself a place in the royal favour that reduced all the rest of the king's ministers to insignificance, and left in his hand for a long course of years nearly the whole power of the state. [WOLSEY, CARDINAL.] The reign of Wolsey may be considered as having begun after the return of Henry from his expedition to France, towards the close of the year 1513; and henceforth the affairs of the kingdom for fourteen or fifteen years were directed principally by the interests of his ambition, which governed and made subservient to its purposes even the vanity and other passions of his master.

The history of the greater part of this period consists of Henry's transactions with his two celebrated contemporaries, Francis I. of France, the successor of Louis XII., and Charles, originally archduke of Austria, but who became king of Spain as Charles I. by the death of his mother's father, Ferdinand, in 1516, and three years after was elected to succeed his paternal grandfather Maximilian I. as emperor of Germany. [CHARLES V.; FRANCIS I.] His position might have enabled the English king in some degree to hold the balance between these two irreconcilable rivals, who both accordingly made it a principal point of policy to endeavour to secure his friendship and alliance; but his influence on their long contention was in reality very inconsiderable, directed as it was for the most part either by mere caprice, or by nothing higher than the private resentments, ambitions, and vanities of himself or his minister. The foreign policy of this reign had nothing national about it, either in reality or even in semblance; it was neither regulated by a view to the true interests of the country, nor even by any real, however mistaken, popular sentiment. Henry had himself been a candidate for the imperial dignity when the prize was obtained by Charles; but he never had for a moment the least chance of success. For a short time he remained at peace, both with Charles and Francis; the former of

whom paid him a visit at Dover in the end of May 1520; and with the latter of whom he had a few days after a seemingly most amicable interview, celebrated under the name of the 'Field of the Cloth of Gold,' in the neighbourhood of Calais. Wolsey's object at this time however was to detach his master from the interests of the French king; and a visit which Henry paid to the emperor at Gravelines, on his way home, showed Francis how little he was to count upon any lasting effect of their recent cordialities. Before the close of the following year Henry was formally joined in league with the emperor and the pope; and in March 1522, he declared war against France. In the summer of the same year the emperor flattered him by paying him a visit at London; his vanity having also been a short time before gratified in another way by the title of 'Defender of the Faith' bestowed upon him by pope Leo X. (recently succeeded by Adrian VI.) for a Latin treatise which he had published 'On the Seven Sacraments,' in confutation of Luther. Henry continued to attach himself to the interest of the emperor,—even sending an army to France, in August 1523, under the Duke of Suffolk, which succeeded in taking several towns, though only to give them up again in a few months,—until the disappointment, for the second time, of Wolsey's hope of being made pope through the influence of Charles, on the death of Adrian in September of the last-mentioned year, is supposed to have determined that minister upon a change of politics. Before the memorable defeat and capture of Francis at the battle of Pavia, 24th of February 1525, the English king had made every preparation to break with the emperor; having actually commenced negotiations for a peace with Francis's ally, James V., the young king of Scotland, on condition of giving James in marriage his daughter the princess Mary (afterwards queen), who had been already promised to the emperor. In August he concluded a treaty of peace and alliance with France; and after the release of Francis, in March 1526, Henry was declared protector of the league styled 'Most Clement and Most Holy,' which was formed under the auspices of the pope for the renewal of the war against Charles.

Before this date two domestic occurrences took place that especially deserve to be noted. The first of these was the execution, in 1518, immediately before Henry proceeded on his expedition to France, of Edmund de la Pole, duke of Suffolk, whose mother was Elizabeth Plantagenet, sister of Edward IV.; he had lain a prisoner in the Tower ever since a short time before the death of the late king, who had contrived to obtain possession of his person after he had fled to the Continent, and, it is said, had in his last hours recommended that he should not be suffered to live. He was now put to death without any form of trial or other legal proceeding, his crime, there can be no doubt, being merely his connection with the House of York. Wolsey was perhaps as yet too new in office to be fairly made answerable for this act of bloodshed; in the next case the unfortunate victim is generally believed to have been sacrificed to his resentment and thirst of vengeance. In 1521 Edward Stafford, duke of Buckingham, son of the duke beheaded by Richard III. [HENRY VII.], was apprehended on some information furnished to Wolsey by a discarded servant, and being brought to trial was found guilty and executed as a traitor. The acts with which he was charged did not according to law amount to treason, even if they had been proved; but the duke is said by certain indiscretions of speech and demeanour to have wounded the pride of the all-powerful minister; and, besides, he was also of dangerous pedigree, being not only maternally of the stock of John of Gaunt, but likewise a Plantagenet by his descent from Anne, the daughter of Edward III.'s youngest son Thomas, duke of Gloucester. With this nobleman came to an end the great office of hereditary lord high constable.

What may be called the second part of Henry's reign begins in the year 1527, from which date our attention is called to a busy scene of domestic transactions beside which the foreign politics of the kingdom become of little interest or importance. It is no longer the ambition and intrigues of the minister, but the wilfulness and furious passions of the king himself, that move all things. In 1527 Henry cast his eyes upon Anne Boleyn, and appears to have very soon formed the design of ridding himself of Catherine, and making the object of this new attachment his queen. [BOLEYN, ANNE.] Anne was understood to be favourably disposed towards those new views on the subject of religion and ecclesiastical affairs which had been agitating all Europe ever since Luther had begun his intrepid career by publicly opposing indulgences at Wittenberg ten years before. Queen Catherine, on the other hand, was a good Catholic; and, besides, the circumstances in which she was placed made it her interest to take her stand by the Church, as on the other hand her adversaries were driven in like manner by their interests and the course of events into dissent and opposition. This one consideration sufficiently explains all that followed. The friends of the old religion generally considered Catherine's cause as their own; the Reformers as naturally arrayed themselves on the side of her rival. Henry himself again, though he had been till now resolutely opposed to the new opinions, was carried over by his passion towards the same side; the consequence of which was the loss of the royal favour by those who had hitherto monopolised it, and its transference in great part to other men, to be employed by them in the promotion of entirely opposite purposes and politics. The proceedings for the divorce were commenced by an application to

the court of Rome, in August 1527. For two years the affair lingered on through a succession of legal proceedings, but without any decisive result. From the autumn of 1529 are to be dated both the fall of Wolsey and the rise of Cranmer. [CRANMER, THOMAS.] The death of the great cardinal took place on the 29th of November 1530. In January following the first blow was struck at the Church by an indictment being brought into the King's Bench against all the clergy of the kingdom for supporting Wolsey in the exercise of his legatine powers without the royal licence, as required by the old statutes of *provisors* and *premissaries*; and it was in an act passed immediately after by the Convocation of the province of Canterbury, for granting to the king a sum of money to exempt them from the penalties of their conviction on this indictment, that the first movement was made towards a revolt against the see of Rome, by the titles given to Henry of "the one protector of the English Church, its only and supreme lord, and, as far as might be by the law of Christ, its supreme head." Shortly after, the convocation declared the king's marriage with Catherine to be contrary to the law of God. The same year Henry went the length of openly countenancing Protestantism abroad by remitting a subsidy to the confederacy of the Elector of Brandenburg and other German princes, called the League of Smalcald. In August 1532 Cranmer was appointed to the archbishopric of Canterbury. In the beginning of the year 1533 Henry was privately married to Anne Boleyn; and on the 23rd of May following Archbishop Cranmer pronounced the former marriage with Catherine void. In the meantime the parliament had passed an act forbidding all appeals to the see of Rome. Pope Clement VII. met this by annulling the sentence of Cranmer in the matter of the marriage; on which the separation from Rome became complete. Acts were passed by the parliament the next year declaring that the clergy should in future be assembled in convocation only by the king's writ, that no constitutions enacted by them should be of force without the king's assent, and that no first-fruits, or Peter's pence, or money for dispensations, should be any longer paid to the pope. The clergy of the province of York themselves in convocation declared that the pope had no more power in England than any other bishop. A new and most efficient supporter of the Reformation now also becomes conspicuous on the scene, Thomas Cromwell (afterwards Lord Cromwell and Earl of Essex), who was this year made first secretary of state, and then master of the rolls. [CROMWELL, THOMAS.] In the next session, the parliament, which re-assembled in the end of this same year, passed acts declaring the king's highness to be supreme head of the Church of England, and to have authority to redress all errors, heresies, and abuses in the Church; and ordering first-fruits and tenths of all spiritual benefices to be paid to the king. After this various persons were executed for refusing to acknowledge the king's supremacy; among others, two illustrious victims, the learned Fisher, bishop of Rochester, and the admirable Sir Thomas More. [FISHER, JOHN; MORE, THOMAS.] In 1535 began the dissolution of the monasteries, under the zealous superintendance of Cromwell, constituted for that purpose visitor-general of these establishments. Latimer and other friends of Cranmer and the Reformation were now also promoted to bishoprics; so that not only in matters of discipline and polity, but even of doctrine, the Church might be said to have separated itself from Rome. One of the last acts of the parliament under which all these great innovations had been made was to petition the king that a new translation of the Scriptures might be made by authority and set up in churches. It was dissolved on the 18th of July 1536, after having sat for the then unprecedented period of six years.

Events now set in a new current. The month of May of this year witnessed the trial and execution of Queen Anne—in less than six months after the death of her predecessor, Catherine of Aragon—and the marriage of the brutal king, the very next morning, to Jane Seymour, the new beauty, his passion for whom must be regarded as the true motive that had impelled him to the deed of blood. Queen Jane dying on the 14th of October 1537, a few days after giving birth to a son, was succeeded by Anne, sister of the Duke of Cleves, whom Henry married in January 1540, and put away in six months after—the subservient parliament, and the not less subservient convocation of the clergy, on his mere request, pronouncing the marriage to be null, and the former body making it high treason "by word or deed to accept, take, judge, or believe the said marriage to be good."

Meanwhile the ecclesiastical changes continued to proceed at as rapid a rate as ever. In 1536 Cromwell was constituted a sort of lord-lieutenant over the Church, by the title of vicar-general, which was held to invest him with all the king's authority over the spirituality. The dissolution of the monasteries in this and the following year, as carried forward under the direction of this energetic minister, produced a succession of popular insurrections in different parts of the kingdom, which were not put down without great destruction of life, both in the field and afterwards by the executioner. In 1538 all incumbents were ordered to set up in their churches copies of the newly-published English translation of the Bible, and to teach the people the Creed, the Lord's Prayer, and the Ten Commandments, in English; the famous image of our Lady at Walsingham, and other similar objects of the popular veneration, were also under Cromwell's order removed from their shrines and burnt. In 1539 the parliament, after enacting (by the 31 Henry VIII., c. 8)

that the proclamation of the king in council should henceforth have the same authority as a statute, passed the famous act (the 31 Henry VIII., c. 14) known by the name of the 'Six Articles,' or the 'Bloody Statute,' by which burning or hanging was made the punishment of all who should deny that the bread and wine of the sacrament was the natural body and blood of the Saviour—or that communion in both kinds was not necessary to salvation—or that priests may not marry—or that vows of chastity ought to be observed—or that the mass was agreeable to God's law—or that auricular confession is expedient and necessary. This statute, the cause of numerous executions, proceeded from a new influence which had now gained an ascendancy over the fickle king, that of Gardiner, bishop of Winchester, the able leader of the party in church and state opposed to Cranmer and Cromwell. [GARDINER, STEPHEN.] This new favourite was not long in effecting the ruin of the rival that was most in his way: Cromwell, who had just been created earl of Essex, and made lord chamberlain of England, was, in the beginning of June 1540, committed to the Tower on a charge of treason, and beheaded in a few weeks after.

On the 8th of August this year Henry married his fifth wife, the Lady Catherine Howard, whom he beheaded on the 13th of February 1542. During this interval he also rid himself by the axe of the executioner of a noble lady whom he had attainted and consigned to a prison two years before on a charge of treason, Margaret, countess dowager of Salisbury, the daughter of the late Duke of Clarence, and the last of the York Plantagenets. Her real crime was that she was the mother of Cardinal Pole, who had offended the tyrant, and who was himself beyond his reach.

In the latter part of the year 1542 war was declared by Henry against Scotland, with a revival of the old claim to the sovereignty of that kingdom. An incursion made by the Duke of Norfolk into Scotland in October, was followed the next month by the advance of a Scottish army into England, but this force was completely defeated and dispersed at Solway Moss, a disaster which is believed to have killed King James, who died a few weeks after, leaving his crown to a daughter, the unfortunate Mary Stuart, then only an infant seven days old. The failure of the efforts of the English king to obtain possession of the government and of the young queen, owing to the successful resistance of Cardinal Beaton and the Roman Catholic party, led to a renewal of hostilities in the spring of 1544, when Scotland was invaded by a great army under the Karl of Hertford, which penetrated as far as Edinburgh, and burned that capital with many other towns and villages. In the preceding year also Henry had concluded a new alliance with the emperor against the French king; and in July 1544 he passed over with an army to France, with which he succeeded in taking the town of Boulogne. On this however the emperor made a separate peace with Francis; and on the 7th of June 1546 Henry also signed a treaty with that king, in which he agreed to restore Boulogne and its dependencies in consideration of a payment of two millions of crowns.

He had some years before found a sixth wife, Catherine Parr, the widow of the Lord Latimer, whom he married on the 10th of July 1543. As the infirmities of age and disease grew upon him, the suspiciousness and impetuosity of his temper acquired additional violence, and the closing years of his reign were as deeply stained with blood as any that had preceded them. One of his last butcheries was that of the amiable and accomplished Henry Howard, earl of Surrey, who, being convicted, after the usual process, of treason, was executed on the 19th (other accounts say the 21st) of January 1547. "Already Henry," says Holinshed, "was lying in the agonies of death." Surrey's father, the Duke of Norfolk, was also to have suffered on the 28th; but was saved by the death of the king at two o'clock on the morning of that day.

The children of Henry VIII. were—1 and 2, by Catherine of Aragon, two sons who died in infancy; 3, Mary, afterwards queen of England; 4, by Anne Boleyn, Elizabeth, afterwards queen; 5, a son still-born, 29th of February 1535; 6, by Jane Seymour, Edward, by whom he was succeeded on the throne.

The most important changes made in the law during this reign were those affecting ecclesiastical affairs, of which the principal have been already noticed. Along with these may be mentioned the statute defining the degrees within which marriage should be lawful (25 Henry VIII., c. 22), which, in regard to that point, is still the law of the land. The law of real property was also materially altered by the Statute of Uses (27 Henry VIII., c. 10), and by various statutes permitting the devise, which was not before allowed, except by the custom of particular places, of real estates by will. To this reign is also to be assigned the origin of the Bankrupt Laws. Wales was first incorporated with England, and the laws and liberties of the latter country granted to the inhabitants of the former, in the 27th year of Henry VIII.; and Ireland, which before was styled only a lordship, was in 1542 erected into a kingdom.

HENRY I. surnamed the Fowler, Emperor of Germany, was the son of Otho, duke of Saxony and Thuringia, and was born in A.D. 876. In his father's lifetime he distinguished himself as a warrior against the bordering Slavonians. In 912 he succeeded his father as duke, and had to defend his territories against the emperor Conrad I. This he effected, and Conrad on his death-bed in 918 recommended his

former adversary as the most worthy to be his successor. Henry was elected, and by his power and influence restored the disturbed empire to a state of internal peace. He was however soon afterwards engaged in a war against the Hungarians, who had invaded and ravaged the empire. His first efforts against them were unsuccessful, but he at length succeeded in obtaining a truce, and devoted the interval to fortifying the towns of Germany for the protection of the inhabitants, and by granting municipal privileges was the originator of the Germanic corporations. He afterwards prosecuted the war against Hungary with such success, that after the victory of Keuschberg, near Merseburg, the empire was freed for upwards of twenty years from any attack by the Hungarians. Henry the Fowler died in 936, and was succeeded by his son Otho I.

HENRY II., the great-grandson of Henry I., and the last emperor of the House of Saxony, was born in 972, the son of Henry, duke of Bavaria. He succeeded his father in 995, and accompanied his cousin the emperor Otho III. in his expedition to Rome. Otho died in Italy. Henry possessed himself of the crown jewels, and by some intrigue, and by the exercise of force against some of his competitors, succeeded in procuring his election, and was crowned emperor at Mainz in 1002. His reign was disturbed by domestic wars. His brothers revolted against him in Germany, and Harduin, marquis of Ivrea, assumed the iron crown in Italy. Though Henry succeeded in repressing these outbreaks, with the assistance of the pope, they were continually recurring. He and his wife were great upholders of the Church. His wife, Cunegunda, lived with him in a state of continence, and died in the convent of Neuberg in 1038. They were both canonised after their deaths as saints. Henry died on July 13, 1024, at Grona, near Göttingen, and was succeeded by Conrad II.

HENRY III., the son of Conrad II., was born in 1017. In 1026 he was elected King of the Romans, and succeeded his father in the imperial dignity in 1039. Possessed of great talents, well educated, and of a firm and dignified character, he became one of the most powerful and most respected of the emperors of Germany. He repressed the turbulence of the more powerful vassals of the empire, and made great advances towards its consolidation. He governed the church with a stern hand, and humbled the Roman see by deposing three successive popes on account of their gross immoralities, and at length causing Clement II., who had been bishop of Bamberg, to be chosen. The celebrated Hildebrand outwardly appeared to aid the emperor in his attempts to purify the Church, but secretly took such measures as insured his own election to the papacy on a future vacancy, by which all the labours of the emperor were rendered useless. Henry was successful in his wars against Bohemia, took Prague, and forced the Duke of Bohemia to sue for a peace, and to hold the duchy by feudal servitude. In Hungary he twice restored Peter to the throne, when expelled by his subjects, and when Andrew became finally successful over Peter, he united himself to the conqueror by giving him his daughter in marriage. In Italy the Normans, who had conquered Apulia and Calabria, were induced to become his vassals. In the midst of his power he died, not without suspicion of having been poisoned, in 1056, leaving a son by his second wife, Agnes of Poitiers, to succeed him. His first wife had been Margaret, daughter of Canute, king of England.

HENRY IV., the son of the preceding, was born in 1050, and had been chosen king of the Romans in 1054. His mother Agnes undertook the care of his education, and the diet chose her as regent during his minority. But the strong hand and will of his father were wanting. The great princes of the empire were soon in open revolt. The custody of the young emperor's person was shifted from one powerful subject to another, with little advantage to the realm, and great detriment to the monarch, who became licentious, extravagant, and careless of all but his pleasures. He commenced a war against the Duke of Saxony, in which he displayed much courage and some military talent; but in the course of it he was induced to seek the intervention of the pope, which was sought also by his opponent. This pope was now Gregory VII.; the former Hildebrand, who decided against him. Henry assembled a diet at Worms, who pronounced the deposition of the pope for presuming to constitute himself the judge of his sovereign. Gregory however excommunicated him, and declared his subjects absolved from their allegiance. Henry at length saw himself compelled to submit to the haughty primate; he crossed the Alps with his wife and child in the depth of winter, arriving at Canossa, where the pope was residing, in January 1077; and was compelled to stand for three days in the open court-yard before the excommunication was removed. While Henry was in Italy, Rudolph of Swabia had been elected emperor in Germany, but on his return Henry levied an army, and a devastating contest took place, which was only partly ended by the death of Rudolph in battle, on October 15, 1080. Gregory, who had excited much discontent among a great portion of the clergy by rigidly insisting on their celibacy, had been blockaded in Canossa by some Italian partisans of Henry; but had been released. He sent Rudolph a crown, and placed Henry anew under the ban of the church. Henry, now a conqueror, retaliated by summoning a fresh council at Brixen, who deposed Gregory, elected Clement III. as pope; and Henry entered Italy with an army, forced Gregory to take refuge in the castle of St. Angelo, and had himself and wife crowned by Clement in 1084.

In Germany in the meanwhile a new emperor, Hermann of Luxembourg, had been elected by the disaffected princes. Robert Guiscard, with a large force, had relieved Gregory from the state of siege; and Henry returned to Germany, where he succeeded in conquering his rival, and forcing the Saxons to sue for peace. In 1090, for the third time, he entered Italy, and after some successes was recalled by the rebellion of his eldest son, Conrad, who had been elected king of the Romans. This insurrection was suppressed, though supported by pope Urban II., and in 1097, at a diet held in Aix-la-Chapelle, Henry, the second son, was elected king of the Romans instead of Conrad, who died in 1101. The second son however was worse than the first. Gained over by the legates of the pope he declared war against his father, and when the emperor wrote in hopes of recalling him to his obedience, he appointed a meeting at Mainz, where he implored pardon, succeeded in withdrawing the emperor outside the town, then seized him as a prisoner, and confined him in the castle of Burghenheim. Henry after a time escaped, and retired to Liège, where he died on August 7, 1106. In this reign the first crusade was commenced.

HENRY V., who was born in 1081, succeeded his father. He had hitherto shown himself a warm adherent of the papacy; but his defence decreased when he found himself firmly seated on the throne. He annulled the decisions of the councils of Guastalla and Châlons respecting investitures, maintaining his own right to present to benefices. He made war against Poland and Bohemia without much success. In 1111 he married Matilda, the daughter of Henry I. of England. The remainder of his reign was occupied with contests against the princes of Germany and with the popes; he forced Pascal II. to fly from Rome, and on his death made Gregory VIII. pope; but the cardinals elected Gelasius II., with whom Henry at length concluded a peace, renouncing his right of investiture. He died on the 22nd of May 1125, the last emperor of the Franconian line, and was succeeded by Lotharius of Saxony.

HENRY VI., the son of Frederic Barbarossa, was the third emperor of the Hohenstaufen race. He was born in 1165, was elected King of the Romans in 1169, and succeeded his father in 1190. Soon after his accession he conducted an army into Italy to support his claims on the crown of Sicily, which he claimed in right of his wife Constance, and which had been assumed by Tancred, the illegitimate brother of Constance. He besieged Naples, but failed in taking it, and returned to Germany: here he obtained possession of Richard I. of England, whom, after a long and harsh imprisonment, he restored to liberty on the payment of a large ransom. This money enabled him to make a fresh expedition to Italy. Tancred was dead; Naples surrendered, Sicily submitted, and he was crowned at Palermo in October 1194. Soon afterwards he took the cross, advocated a crusade, and assembled an army, with which he set out ostensibly for the Holy Land, but employed it instead in endeavouring to subdue Sicily, where his cruelties and oppression had created an insurrection. This war he conducted with such barbarity as to revolt his own partisans, and he died at Messina on the 28th of September 1197, strongly suspected of having been poisoned. He was succeeded by Philip of Suabia.

HENRY II., King of Castile (Henry I. died a boy in 1217), was the natural son of Alfonso XI., and was born in January 1333. His brother, Don Pedro, on succeeding to the throne, showed him considerable kindness; he called him and his mother to court, and made him count of Trastamara. The count however bore a secret hatred against his brother, and sought by all means to create discontent against him, which the severity and cruelty of Pedro rendered comparatively easy. A pretext for revolt was made from the deaths of the queen and of the mother of Henry, Pedro being accused as the cause of both. This insurrection was suppressed, and Henry fled to Portugal; he then joined the King of Aragon in an attack on Castile, was again beaten, and fled to France. Here he raised a considerable body of troops, with Bertrand du Guesclin as commander. Under this leader he had some successes, and was crowned at Burgos; but Edward the Black Prince coming to the assistance of Don Pedro, totally defeated Henry at the battle of Najera, and took Du Guesclin prisoner. Henry again fled to France; but the cruelties of Pedro excited fresh discontents, of which Henry took advantage: he obtained a declaration of his legitimacy from Pope Urban V., money from Charles V. of France, with which he ransomed Du Guesclin, raised fresh troops, and again invaded Castile. Pedro, unsupported by the English prince, was now beaten, and fled to Montiel, where in an interview Henry slew him with his own hand.

Henry was now (1369) seated on the throne. He liberally rewarded Du Guesclin and his other adherents, and then devoted himself to the well-governing of his people; he defended himself successfully against the kings of Portugal, Aragon, and Navarre. He died on the 29th of May 1379, and was succeeded by his son, John I.

HENRY III., King of Castile, was born at Burgos in 1379, and succeeded his father John I. in October 1390. The struggles of the various pretenders to the regency occasioned many disorders, but at the age of thirteen Henry put an end to them by assuming the government himself; he possessed a strong intellect and an energetic character. He speedily suppressed all internal commotions, vanquishing those that appeared in arms, and then winning them by his clemency. He laid aside the pomp of courts, living with the utmost

economy in order to restore the shattered finances of his country and to avoid burdening his subjects. Early in his reign he sought to reconcile the disputes between the rival popes Benedict XIII. and Boniface III.; but though he vainly persuaded Benedict to resign, Boniface was so irritated at his disposal of the church patronage during the dispute that he excommunicated him. This however had no effect on Henry's subjects; and at last, to terminate the schism, in conjunction with other sovereigns, Henry acknowledged Benedict in 1403. He endeavoured to live in peace with his neighbours; but when engaged in war with Portugal and with Granada he showed no want of spirit, and was successful in war, though his feeble and delicate frame prevented him being eminent as a warrior. He also undertook to repress the incursions of the African piratical states, and took and destroyed Tetuan. In 1401, Castile, in common with other parts of Spain, was desolated by the plague, and he endeavoured to mitigate its evils. He died during the war with Granada, on the 25th of December 1406, from exhaustion, and was succeeded by his son, John II., by Catherine of Lancaster, to whom Henry had been married in his father's life-time.

HENRY IV., King of Castile, was the son of John II., and was born in 1425. His youth was distinguished by dissipation and profligacy, but on his father's death, in 1454, few princes had ascended the throne with fairer prospects. His father had made himself respected by all his neighbours, and had left him the realm in profound peace; but he suffered himself to be governed by favourites, who made a rapacious use of his authority, provoked discontent among the people, and one of them, Beltran de la Cueva, was accused of dishonouring his bed; the Cortes refusing to acknowledge the infanta as heiress to the crown in consequence of their belief of her illegitimacy. The Cortes next proceeded, in 1465, to depose him, and proclaimed his brother Alfonso king. Henry however was not deficient in courage or talent: he assembled an army, and a civil war commenced, which lasted till 1468, when the sudden death of Alfonso brought it to a close; for Isabella, the sister, then only seventeen years of age, whom Alfonso's party sought to set up in his place, absolutely refused to rob her brother Henry of his rightful crown. Henry, in return for this refusal, consented to the divorce of his queen for infidelity, the disinheriting of his daughter Joanna, and the nomination of Isabella as heiress of Castile. Tranquillity thus restored, Henry wished to marry Isabella to a brother of the King of France; but Isabella chose for herself Ferdinand, the son of the King of Aragon, to whom she was married in 1469. Henry at first threatened to disinherit her, and to declare his daughter again his heir, but was ultimately reconciled to Isabella and Ferdinand. In 1465 Henry had solicited Pope Calixtus III. to proclaim a crusade against the Moors of Granada. The war had been prosecuted with few events of importance on either side; but in 1474 he had assembled a large army at Segovia in order to prosecute it with more vigour, when he was taken suddenly ill, and died on the 20th of December 1474.

HENRY OF HUNTINGDON, an ancient English historian, the son of Nicholas, a married priest, was born about the end of the 11th century; and, according to Warton ('Hist. Engl. Poet,' *dis. ii. p. 125*), was educated under Alcuine of Anjou, a canon of Lincoln cathedral. Aldwin and Reginald, both Normans and abbots of Ramsey, were his patrons. He was made archdeacon of Huntingdon (whence he took his name), by Robert Bloet, bishop of Lincoln, some time before 1123. In his youth he discovered a taste for poetry, but in more advanced years applied himself to the study of history; and at the request of another friend and patron, Alexander, bishop of Lincoln, composed a general history of England, from the earliest accounts to the death of Stephen (1154), in eight books, published by Sir Henry Savile among the 'Scriptores post Bedam,' folio, London, 1596, and Francof., 1601. The early part of this history was a compilation from older writers; the sequel, from what he had heard and seen. Warton, in his 'Anglia Sacra,' vol. ii. p. 694, has published a letter of Henry of Huntingdon to his friend Walter, who was also abbot of Ramsey, 'De Mundi Contemptu,' which contains many curious anecdotes of the kings, nobles, prelates, and other great men who were his contemporaries. Warton ('Hist. Engl. Poet,' *ut supr.*) says, in the Bodleian Library there is a manuscript Latin poem by Henry of Huntingdon on the death of King Stephen and the arrival of Henry II. in England, which is by no means contemptible. The exact time of his death is not known.

HENRY, MATTHEW, an eminent Nonconformist divine, was born at Broad Oak, a farm-house in the township of Iscoyd in Flintshire, October 18, 1662. His father, Philip Henry, who was highly esteemed for his talents and piety, was one of the 2000 clergymen who left the church of England in 1662, in consequence of their refusal to comply with the regulations of the 'Act of Uniformity.' Matthew Henry received the principal part of his education under Mr. Doolittle of London. In 1685 he commenced the study of the law in Gray's Inn, but he soon relinquished this profession; and after being ordained in 1687, settled at Chester in the same year as minister of a Dissenting congregation. In 1712 he left Chester, and became the minister of another congregation at Hackney. He died on the 22nd of June 1714, of apoplexy, while he was travelling from Chester to London.

The work by which Matthew Henry is principally known is his 'Exposition of the Old and New Testament,' which originally appeared

in five volumes folio, and has since been frequently reprinted. This work has been greatly admired by many persons, on account of the piety of the author and the lively style in which it is written; and perhaps it is the best Commentary on the Bible for the use of those persons who are more anxious to obtain a devout sentiment from a text than to understand the real meaning of the passage. Matthew Henry did not live to complete the 'Exposition.' The remarks on the latter books of the New Testament, from Romans to Revelations, were written by the ministers whose names are printed in the 'Exposition.' Matthew Henry was also the author of many other works, of which the principal are—'Inquiry into the Nature of Schism;' 'Life of Philip Henry;' 'Scripture Catechism;' 'Communicant's Companion;' 'Discourses against Vice and Profaneness;' 'Method of Prayer,' and numerous sermons on separate subjects. The miscellaneous works were republished in 8vo, London, 1830.

The life of Matthew Henry has been written by Tong, 8vo, 1716; but a fuller and more accurate account of his life and writings is given by Williams in his 'Memoirs of the Life, Character, and Writings of the Rev. M. Henry,' prefixed to the edition of the 'Exposition,' published in 3 vols. 8vo, London, 1828.

HENRY, PATRICK, an American orator and statesman, was born in Hanover county, Virginia colony, May 29th, 1736. His father was a planter in easy circumstances, though burdened with a large family; and Patrick when a boy learned in his father's house a little Latin and less Greek, both of which he speedily forgot, but acquired instead considerable skill in hunting, fishing, and shooting, in which the greater part of his time was spent. At sixteen his father set him up in a small store, in which he was as unsuccessful as in his classical studies. At eighteen he married, and took a small farm; but most of his time was employed in loitering about in the bar of his father-in-law's tavern at Hanover, serving the customers, or amusing them with his pleasantries. The farm failing, he again opened a store, but this after a short trial resulted in bankruptcy. His misfortunes however, according to his biographer, "were not to be traced either in his countenance or his conduct." He had, under them all, found ample solace in his long solitary hunting and fishing excursions, music and dancing, of which he was passionately fond, and the Hanover tavern-bar. Now however he determined to take a new course, and "with a buoyant mind resolved on becoming a lawyer." Doubtless had it been necessary in Virginia, as at Lincoln's Inn or the Temple, to have eaten through certain terms in order to be called to the bar, the young Henry would have been found equal to the occasion; as it was, he took a shorter course. He gave "six weeks of close application" to legal studies, presented himself at the examination (probably not a very severe one), passed, and received the usual license to act as a barrister.

Little alteration was however seemingly made in Henry's habits. He still resided, if he did not still serve, at the tavern; shot and fished as usual; mixed familiarly with all classes at the tavern-bar; dressed as coarsely, and moved as awkwardly, as the rudest of the country people; and was in fact only known as a jovial young lawyer without briefs, and with only a little pettifogging village business. But the three years thus spent were not wholly spent in idleness. He had been an observant witness of the progress of events; he read men if he did not read books; and was prepared to make up by shrewdness and tact for his deficiencies in legal lore. The time had arrived which was to show of what stuff he was made. What was known as the "great parsons' cause," and which proved to be an important step in the progress towards American independence, had arrived at its determination. Tobacco had for some time been the legal currency in Virginia, and the incomes of the established clergy of the colony were, by acts of the colonial legislature (1696 and 1748), which had received the royal assent, fixed at 16,000 lbs. of tobacco each; but after some failures of the crop the legislature passed an act (1768), commuting the payment to one of twopence for each pound of tobacco. This was the market-price when the previous act was passed, but the market-price was now three times that sum, and the clergy refused to concur. On the question being submitted to the English government, the king in council refused his assent to the act. The matter was now brought, by the action of a clergyman named Maury against the collector and his sureties, before the law-courts of Virginia. The judges on the technical question decided in favour of the claims of the clergy, on the ground that the act of 1758 was not of force without the royal assent. It only remained therefore, as it would seem, as a matter of form, to impanel a jury to assess the damages. The counsel for the defendants held that the case was in fact at an end, and on his clients insisting on going before the jury, withdrew from the cause. Affairs stood thus when Patrick Henry was applied to and accepted the brief. On the day of trial, December 1st 1763, the court was crowded with the clergy and their friends, and their opponents the planters and the popular party. Henry's father was the presiding judge. The plaintiffs' counsel merely explained the state of the law, and enlisted the clergy: it was a plain case, and could not be made plainer. Patrick Henry rose to reply: it was his first speech. He commenced awkwardly, faltered in his exordium, and his friends were in despair; but he soon recovered himself, and soon every eye and ear was strained to catch each word and gesture of the orator. Spurning aside the technicalities of the case, he with fiery earnestness argued for the right of the colony to legislate for itself on matters of internal administration, denounced

the clergy for their want of patriotism in appealing to the king, and after endeavouring to show that the act of 1758 was an act good in itself, and one required by the circumstances of the colony, he, gathering force as he went, declared that the "king who annuls or disallows laws of so salutary a nature degenerates into a tyrant, and forfeits all right to obedience." Such language had never before been heard in a public court. Cries of "Treason! treason!" were uttered from the clergy, but were drowned in the popular acclamations. The case had commenced as one of pecuniary compensation: Henry converted it into one involving the independence of the colonial legislature, and the extent to which obedience was due to the English crown by the American people. The auditors were aroused to perfect frenzy. A verdict of a penny damages was at once returned, and the judges, carried away by the popular feeling—regardless of what was evidently the law of the case—refused unanimously a motion for a new trial. This still further stimulated the popular joy, and Henry was borne about the streets in triumph on the shoulders of the crowd. The remembrance of that day long lived fresh in the memory of the Virginians. Writing sixty years afterwards, Mr. Wirt said that the old people of that part of the country were accustomed to say, in their homely fashion, as the highest compliment they could pay to a speaker, "He's almost equal to Patrick, when he pled against the parsons." On the other hand, there was a talk of indicting the young lawyer for using seditious words, and lists of witnesses were made out; but matters were tending to another issue, and the report of Henry's speech did no little to advance their progress.

Henry was at one step the foremost man at the local bar: he removed to Louisa, and having greatly distinguished himself by a speech he made as counsel before the House of Burgesses in defence of the right of suffrage, he was at the next vacancy (1766) elected as a representative in the Virginian legislature. It was a period of intense expectation. News had sometime since reached America of the imposition of the obnoxious 'Stamp Act.' The day for its enforcement approached, and neither of the colonies had made a sign. In the legislature of Virginia all was hesitation and timidity. Henry, when but a few days a member, determined to bring matters to a crisis. He moved five resolutions, affirming in the strongest manner the undoubted, uninterrupted, and inalienable right of the people of Virginia to be governed by their own laws, respecting internal polity and taxation, and declaring that any attempt to vest such power in any other person whatever, was an encroachment on American freedom. The debate was a stormy one, and the storm rose to its height when Henry, after supporting his resolutions with a torrent of impassioned eloquence, exclaimed in a voice of thunder—"Cæsar had his Brutus,—Charles the First his Cromwell,—and George the Third—" "Treason!" shouted the Speaker, and "treason! treason!" re-echoed from all parts of the house; but Henry, fixing his eye on the Speaker, continued without faltering—"may profit by their example. If this be treason, make the most of it." The effect was electrical, and the resolutions were adopted, though one of them was afterwards rescinded. Thus, as Jefferson afterwards said, "Henry gave the earliest impulse to the ball of the revolution;" and the ball thus set a rolling in Virginia was soon taken up by the other colonies. In all the subsequent proceedings Henry played an equally decided part. With Jefferson and Peyton Randolph he was one of the first to sign Washington's non-importation agreement in 1769; but he was regarded as the leader in Virginia of the Democratic party, of which Jefferson eventually became the head and representative, in opposition to the more conservative party, of which Washington was the head, and the great landholders formed the body.

As Henry was the first to sound the note of revolution, so he was the first to give the signal of an appeal to arms. As early as March 23, 1775, he said in one of his fiery speeches in the convention of Virginia, "Sir, of peace there is no longer any hope. If we wish to be free, we must fight! An appeal to arms, and to the God of Hosts, is all that is left to us!"—words which, though disavowed by the more cautious, found ready acceptance with the young and the ardent throughout the country.

When independence was declared, the state of Virginia elected Patrick Henry its first governor, and he was re-elected the three following years, when he was succeeded by Jefferson. To the duties of his office he addressed himself with honesty and earnestness of purpose, but he threw off none of his old homely and popular habits. Nor did his views alter with the circumstances. As governor he was as ardent a democrat as he had been when a penniless adventurer. To the adoption of the federal constitution he offered the most determined opposition, viewing it as interfering too much with state freedom of action, of the right to which he held very strong opinions. But when the constitution was adopted, he is said to have given in a ready adhesion to it. In the federal government Henry held no office. Washington nominated him Secretary of State in 1795, but there was no great cordiality between them, and Henry declined the office, as he also did that of envoy to Paris, offered to him by President Adams in 1799. He died on the 8th of June 1799. To the last he retained his fondness for field-sports, and he does not seem to have ever conquered his aversion to study. His library is said by his biographer to have consisted at his death of merely a few odd volumes.

(Wirt, *Life of Patrick Henry*; Bancroft, *History of America*; Mahon, &c.)

HENRY, ROBERT, D.D., was the son of a farmer in the parish of St. Ninians, Stirlingshire, where he was born in 1718. Having completed the usual course of education for the Scottish church at the University of Edinburgh, he was licensed as a preacher in 1746, being then master of the burgh or grammar-school of Annan, in Dumfriesshire. In 1748 he was elected minister of a Presbyterian congregation at Carlisle, with which he remained till August 1760, when he removed to a similar situation in the town of Berwick-upon-Tweed. It is supposed to have been about this time that he conceived the project of his 'History of Great Britain, written on a new plan,' on which his literary reputation rests. The same year that he established himself in Berwick he married a Miss Balderston, whose sister afterwards married Gilbert Laurie, Esq., lord provost of Edinburgh; and this connection eventually led, in 1768, to Mr. Henry's removal to that city. His first appointment was as minister of the church of the New Grey Friars, which he retained till 1776, and then exchanged for the easier charge of one of the ministers of the Old Church, in which he continued till his death. His access to the libraries at Edinburgh encouraged him to proceed with the design of his History, which want of the necessary books had before almost induced him to relinquish. The first volume, in 4to, appeared in 1771, the second in 1774, the third in 1777, the fourth in 1781, and the fifth, bringing down the narrative to the accession of Henry VII., in 1785. The author, upon whom the degree of D.D. had been conferred by the University of Edinburgh in 1770, died in 1790; but before his death he had completed the greater part of another volume of his History, extending to the accession of Edward VI., which was published in 1793 under the superintendence of Malcolm Laing, Esq., who supplied the chapters that were wanting, and added an Appendix. Dr. Henry's History has, since its completion, been repeatedly reprinted in twelve volumes 8vo. The author had published the successive quarto volumes on his own account; but when the first octavo edition was proposed in 1786, he sold the property of the work to a publishing house for 1000*l.*, besides which the profits it had already yielded him amounted to 2300*l.* In 1781, on the unsolicited application of Lord Mansfield, a pension of 100*l.* a year was granted to Dr. Henry by the king.

These facts are extracted from a biographical memoir of some length which appeared with the posthumous volume of the History, and in which may be also found a diffuse account of Dr. Henry as a private member of society, in which character he appears to much advantage. His only other publication was a Sermon preached before the (Scottish) Society for propagating Christian Knowledge, in 1778. The early volumes of his History were assailed with unusual violence as they successively appeared by Dr. Gilbert Stuart, well known as the author of various able and learned historical works. Stuart was a man of bad temper and little principle, and he was probably actuated in this affair by feelings of personal animosity to Dr. Henry or some of his friends; but he was a person of genuine learning and original research, as well as of great acuteness, and in many of his objections to the History there was much force and justice. Henry's cause, on the other hand, was taken up by his friends, and there is printed in the 'Memoir of his Life' a very encomiastic character of his work (so far as it had proceeded), which is said to be "by one of the most eminent historians of the present age, whose history of the same period justly possesses the highest reputation," and "who died before the publication of the third volume,"—words which we suppose describe Mr. Hume. The work had certainly considerable merit as the first attempt to write a History of England upon so extended a plan, combining the history of society and the general civilisation of the country with that of public events; and the author has collected a great mass of curious matter, a large portion of which is not to be found in any of our common histories; but it has no pretensions to be considered as executed either classically or critically. It abounds in statements derived from sources of no authority, and in other negligences and inaccuracies, partly arising from the character of the author's mind and acquirements, partly the consequence of his provincial situation and want of acquaintance with or access to the best sources of information. In every one of the departments into which it is divided it is now very far indeed behind the state to which historical and archæological knowledge has advanced.

HENRY, WILLIAM, was the son of Mr. Thomas Henry of Manchester, who was a zealous cultivator of chemical science. Dr. Henry was born on the 12th of December 1775. His earliest instructor was the Rev. Ralph Harrison, who on the establishment of an academy in Manchester, afterwards removed to York, was chosen to fill the chair of classical literature. Immediately after leaving the academy he became an inmate in the house of Dr. Percival, whose character as an able and enlightened physician is well known. Here he remained for some years, and in 1795 he studied at Edinburgh, where the chair of chemistry was occupied by the venerable Dr. Black. After remaining there only one year however, he was obliged from prudential motives to quit the university. On visiting Edinburgh again in 1807 he received the diploma of Doctor in Medicine, and although he subsequently and successfully practised as a physician in Manchester, he was compelled to retire from it on account of the state of his health, which from an accident in early life had always been delicate.

Though the period between his two academical residences was passed in the engrossing occupations of his profession, and the superintend-

ence of a chemical business established by his father, he nevertheless both zealously and successfully attended to the science of chemistry, and from that period until 1836, the year in which he died, he contributed a great number of important papers to the Royal Society, the Philosophical Society of Manchester, and to various philosophical journals. In 1797 he communicated to the Royal Society an experimental memoir, the design of which was to re-establish, in opposition to the conclusions drawn by Dr. Austin, and sanctioned by the approval of Dr. Beddoes and other eminent chemists, the title of carbon to be ranked among elementary bodies, although his proofs indeed contained a fallacy, which in a subsequent paper he himself corrected. In 1800 he published in the 'Philosophical Transactions' researches on muriatic acid gas. These experiments were undertaken in the hopes of detaching the imaginary element, which, in accordance with the prevailing theory, was supposed with oxygen to constitute the acid in question. It was not till many years afterwards that the true nature of this acid was ascertained by Davy, and to the new doctrine Dr. Henry was an early convert.

In 1803 Dr. Henry made known to the Royal Society his elaborate experiments on the quantity of gases absorbed by water at different temperatures, and he arrived at the simple law, "that water takes up of gas condensed by one, two, or more additional atmospheres, a quantity which ordinarily compressed would be equal to twice, thrice, &c., the volume absorbed under the common pressure of the atmosphere." In 1808 he published in the same work a form of apparatus adapted to the combustion of larger quantities of gas than could be fired in eudiometric tubes. In the same year he was elected a Fellow of the Royal Society, and in the year following he received, by the award of the president and council, Sir Godfrey Copley's donation, as a mark of their approbation of his valuable communications to the society. He published various other papers, both in the 'Manchester Memoirs' and in the 'Philosophical Transactions.' His latest communication to the Royal Society was a paper in 1824, in which he succeeded in overcoming the only difficulty he had not before conquered, that of ascertaining by chemical means the exact proportions which the gases left after the action of chlorine on oil and coal gas bear to each other. This he effected by availing himself of the property which had been recently discovered by Döbereiner in finely-divided platina, of determining gaseous combination. All his communications afford admirable examples of inductive research, great philosophical acumen, and almost unequalled precision in manipulating. Dr. Henry was also the author of a most valuable and useful work, entitled 'Elements of Experimental Chemistry,' which has reached the eleventh edition. He was a man of great general information, and considerable literary attainments and ability, as shown by the very superior style of his scientific papers. In his private character he was in every respect estimable.

Dr. Henry's frame, originally delicate, worn out by illness and distracted by loss of sleep, at last gave way, and he died on the 2nd of September 1836 in his sixty-first year.

HENRYSON, ROBERT, a Scottish poet of much merit, lived in the latter part of the 15th century. Of his life hardly anything is known. He is supposed to have been the Robert Henryson whose signature as notary-public is attached to a charter granted in 1478 by the abbot of Dunfermline, in Fifeshire; and he is elsewhere said to have been a schoolmaster in that town. It has been inferred that he must have been an ecclesiastic, and it has been conjectured that he may have been a Benedictine monk. In a poem of Dunbar, printed in 1508, he is spoken of as dead: and in one of his poems he had described himself as a 'man of age.' His tale of 'Orpheus Kyng, and how he yeld to hewyn and to hel to seik his quene,' was printed at Edinburgh, in 1508; and in 1593 there was printed his 'Testament of Faire Creseide,' which had been suggested by the 'Troilus and Creseide' of Chaucer, and is found in the common editions of that poet's works. His beautiful pastoral of 'Robin and Makyne' is known to most readers from Percy's 'Reliques.' Other specimens of Henryson's poems are in Sibbald's 'Chronicle of Scottish Poetry,' Dr. Irving's 'Lives of the Scottish Poets,' Lord Hailes's 'Ancient Scottish Poems,' Ellis's 'Specimens,' and more recent collections. His thirteen poems, called 'Fables,' were edited by Dr. Irving in 1832, for the Bannatyne club, and for that club, in 1824, Mr. George Chalmers had edited the 'Testament of Creseide,' and 'Robin and Makyne.' Henryson writes with much greater purity and correctness than most Scotmen of his time: his versification is good, and his poetical fancy rich and lively.

HEPHÆSTION, a grammarian of Alexandria, lived about the middle of the 2nd century of the Christian era. He is said to have instructed the emperor Vespas, (Julius Capitolinus, c. 2.) He wrote a treatise on Greek metres, which was printed for the first time at Florence in 1528: but the best edition is by Gaisford, 8vo, Oxford, 1810, with the 'Chrestomathia' of Proclus, reprinted at Leipzig, 1832. An English translation of this work, with prolegomena and notes by T. H. Barham, appeared at Cambridge in 1843.

HEPHÆSTION. [ALEXANDER III.]

HERACLITUS of Ephesus, surnamed the Naturalist, belongs to the dynamical school of the Ionian philosophy. He is said to have been born about B.C. 500, and, according to Aristotle, died in the sixtieth year of his age. The title he assumed of 'self-taught' refutes at once the claims of the various masters whom he is said to have

had, and the distinguished position that he held in political life attests the wealth and lustre of his descent. The gloomy haughtiness and melancholy of his temperament led him to despise all human pursuits, and he expressed unqualified contempt as well for the political sagacity of his fellow-citizens as for the speculations of all other philosophers, as having mere learning and not wisdom for their object. Of his work 'On Nature' (*περὶ φύσεως*), the difficulty of which obtained for him the surname of 'the obscure,' many fragments are still extant, and exhibit a broken and concise style, hinting rather than explaining his opinions, which are often conveyed in mythical and half-oracular images. On this account he well compares himself to the Sibyl, "who," he says, "speaking with inspired mouth, smileless, inornate, and unperfumed, pierces through centuries by the power of the god."

According to Heraclitus, the end of wisdom is to discover the ground and principle of all things. This principle, which is an eternal everliving unity, and pervades and is in all phenomena, he called *πῦρ*. By this term Heraclitus understood, not the elemental fire or flame, which he held to be the excess of fire, but a warm and dry vapour; which therefore, as air, is not distinct from the soul or vital energy, and which, as guiding and directing the mundane development, is endued with wisdom and intelligence. This supreme and perfect force of life is obviously without limit to its activity; consequently nothing that it forms can remain fixed; all is constantly in a process of formation. This he has thus figuratively expressed: "No one has ever been twice on the same stream." Nay, the passenger himself is without identity: "On the same stream we do and we do not embark; for we are and we are not."

The vitality of the rational fire has in it a tendency to contraries, whereby it is made to pass from gratification to want, and from want to gratification, and in fixed periods it alternates between a swifter and a slower flux. Now these opposite tendencies meet together in determinate order, and by the inequality or equality of the forces occasion the phenomena of life and death. The quietude of death, however, is a mere semblance which exists only for the senses of man. For man in his folly forms a truth of his own, whereas it is only the universal reason that is really cognisant of the truth. Lastly, the rational principle which governs the whole moral and physical world is also the law of the individual; whatever therefore is, is the wisest and the best; and "it is not for man's welfare that his wishes should be fulfilled; sickness makes health pleasant, as hunger does gratification, and labour rest."

The physical doctrines of Heraclitus formed no inconsiderable portion of the eclectic system of the later Stoics, and in times still more recent there is much in the theories of Schelling and Hegel that presents a striking though general resemblance thereto.

The fragments of Heraclitus have been collected from Plutarch, Stobæus, Clemens of Alexandria, and Sextus Empiricus, and explained by Schleiermacher in Wolf and Buttman's 'Museum der Altherthumswissenschaft,' vol. i. See also Brandis's 'Handbuch der Geschichte der Griechisch-Röm. Philos.,' Berlin, 1835; and Ritter's 'History of Antient Philosophy,' Oxford, 1837.

HERACLIUS, the son of the patrician Heraclius, who was governor of Africa under the Emperor Phocas, assisted in dethroning the latter in A.D. 610, and was proclaimed emperor in his place. The destitute condition of the empire at the accession of Heraclius compelled him to be an almost inactive spectator of the ruinous invasions of the Avars in Europe and the Persians in Asia. By submitting to an annual tribute of one thousand talents (pounds?) of gold, as many talents of silver, one thousand silk robes, and one thousand slave girls, he induced the Persian king Chosroes or Khosrew to discontinue his invasions of Asia Minor, and to be satisfied with the conquests he had made from the Greek empire, which comprehended Egypt and the whole of the Asiatic provinces east and south of a line drawn from the northern frontiers of Syria to the eastern extremity of the province of Pontus. Heraclius made a less humiliating peace with the Avars. Having got rid of his enemies, he applied himself to reform the discipline of the army, and he employed vigorous means to fill his treasury, not sparing the property of the churches; he was thus enabled to raise an army strong enough to stop all further designs of the Persian king. The plan of attacking that powerful foe was bold and well designed, and it was executed with so much boldness and prudence, and such a startling combination of offence and defence, as to equal the strategical operations of the greatest generals.

A powerful Persian army was stationed in the valley of the Upper Euphrates ready to descend through the passes of the Anti-Taurus into the high plains of Cappadocia, and to push on towards Constantinople, as they had done in 616. The army of Heraclius, consisting chiefly of raw levies, was quartered in the environs of Constantinople, and afterwards in those of Chalcedon on the Asiatic shore of the Bosphorus, and a whole year was required to prepare his men for a campaign. But Heraclius was master of the sea, and his numerous fleet enabled him to choose his base of operation. Early in the spring of 622 he embarked his troops, and from the Bosphorus sailed to the eastern corner of Cilicia, which lies round the bay of Iskenderún (Alexandria), and is protected on the north and east by the Taurus, and on the south by Mount Amanus. There on the plain of Issus he continued accustoming his troops to actual warfare by making them manoeuvre in the same way as modern troops do, and he occupied the

Cilician and Syrian gates and other passes that lead through the surrounding ranges. A Persian army approaching in full confidence of making the Romans prisoners of war, or of forcing them to re-embark was turned, routed, and driven into the mountains of Armenia. Having thus cleared his way and secured his rear, Heraclius marched through the Cilician gates northward in the direction of Mount Argæus (Arjish) and the Upper Halys (Kizil Irmák), where, as it seems, a portion of his troops remained during the winter as a body of observation. The emperor with the main body advanced upon Trebizond, and quartered his troops in the province of Pontus. Trebizond now became the centre of his operations. He left it however soon after his arrival, sailed to Constantinople, and in the following spring of 623 returned with a fleet and a chosen body of 5000 men.

From Trebizond Heraclius carried the war, in the spring of 623, into the heart of Persia. The nations in the Caucasus were his allies, and he had entered into negotiations with the khazars beyond the Caucasus. These were the causes of his first advancing north-east into the Caucasian provinces, and only after having shown himself there and increased his army through the contingents of his allies, he marched south upon Charsa (Kars) and thence in a direction parallel with the Araxes as far as the great bend of that river, where, after a south-eastern and eastern course, it turns north-east. Thence he marched right upon Gazaca or Gandzaca, which is the still common Armenian name of Tabriz, and this city fell into his hands with all its wealth, Chosroes, who was in the neighbourhood with 40,000 men, not daring to offer battle for the relief of his northern capital. From Gandzaca Heraclius marched south, turned the Persian army and fell upon their rear, took and destroyed Thebarma, now Urumiyeh, near the western shore of the large lake of Urumiyeh, which is said to be the birthplace of Zoroaster, and many other cities which have not yet been identified, and at last wheeled round and took up his winter-quarters in the flat country between the Lower Araxes and the Caspian, which is now known as the plain of Mogan. We may suppose that he chose that tract, which is renowned for its vast pasturages, for the support of his numerous cavalry, and for the purpose of having an easy communication with the khazars, who used to pass through Daghستان and the Iron Gate, near Derbent, whenever they invaded Persia.

In the following year, 624, Heraclius penetrated into the heart of Media, took Casbin, and probably also Asbahan (Isfahán), defeated Chosroes in a pitched battle, and, after having carried the Roman arms farther into Persia than any of his predecessors, returned to his former winter-quarters at the foot of the Caucasus.

During this time Chosroes had withdrawn his troops from Egypt and Syria, and thought himself strong enough to act on the offensive. In the spring of 625 he ordered his lieutenant Sarbar, or Sarbaraza, to menace Asia Minor, while he endeavoured to keep the Roman emperor at check in the Caucasus. Sarbar, who was in Northern Mesopotamia, marched south-west and fell upon the eastern angle of Cilicia. His intention was apparently to take the easiest way for penetrating into Asia Minor, to cut off the communication between the Romans in the fortresses of the Anti-Taurus and the Taurus with the Mediterranean, and to destroy the magazines of the Romans in Cilicia. Informed of this diversion, Heraclius moved on; but while he appeared to threaten the main body of the Persians under Chosroes, he suddenly passed by, left the defence of Armenia to his Caucasian allies, and followed Sarbar through Mesopotamia, either by his track or on a parallel road. They met in Cilicia on the banks of the Sarus, now Sihún, at a moment when Sarbar was in a very critical position. Theopbanes says, that Heraclius approached from Germinicia (Mariásh), passed by Adána, and arrived in Cilicia before Sarbar; and as, when the battle began, the Romans were on the right and the Persians on the left bank of the Sarus, we may suppose that Sarbar came through the Syrian passes and found himself in presence of the main army of the Romans, just when he was going to attack the Cilician passes. In the ensuing battle Heraclius astonished both his own and his enemy's troops by his heroic deeds. At the head of a few veterans he stormed the stone bridge over the Sarus (below Adána), which the Persians had occupied and fortified, and slew with his own hand a gigantic Persian whom nobody dared to fight. After a bloody conflict the Persians were routed; and Sarbar escaped, through the Syrian passes, with the scattered remnants of his army to Persia. Heraclius did not pursue him, but marched through the Cilician passes upon Sebaste (Siwás), and took up his winter-quarters in Pontus.

The next campaign of 626 equals the most splendid military operations in ancient or modern time. Early in 626 Chosroes opened the campaign with two armies against Heraclius, and a third under Sarbar, who was commissioned to attempt a second invasion of Asia Minor. Sarbar was successful, traversed the whole peninsula, and reached the walls of Chalcedon, opposite Constantinople; and, at the same time, a host of more than 100,000 Avars and other barbarians, the allies of Chosroes, invaded Thrace, laid siege to Constantinople, and twelve times assailed its walls. Chosroes hoped to induce Heraclius to hasten to the succour of his capital, but the emperor stood firm at the foot of the Caucasus, despatching however, by sea, 12,000 armed horsemen, who arrived safely at Constantinople. He knew that however great the danger was for Constantinople, the Persians and

Avars had no ships to effect a union, and that the inhabitants of the capital would fight to the last before they surrendered to an enemy whom it was more dangerous to encounter in the open field than in their assaults upon walls and towers. A Slavonian fleet having entered the Bosphorus, destined to convey the Persians over to the European shore, the Greek galleys left the Golden Horn, and, in sight of the besiegers, destroyed the ships of the barbarians or took them and carried them off into the harbour of Constantinople. Shortly after this event the Avars withdrew and Constantinople was free. Although Sarbar continued to amuse himself with the siege of Chalcedon.

While this took place in the west, Theodore, the brother of Heraclius, defeated the Persian general Said in Armenia, and the emperor defended with success the Caucasian provinces against the desperate attack of Chosroes, who took the field against him with a select army of 50,000 men called the Golden Spears. A still greater advantage the emperor derived from effecting an alliance with Ziebel, the khan of the Khazars, who came through the Iron Gate with a numerous host, and joined the Romans at Tiflis (Tiflis). Another army of Khazars invaded Persia on the side of Turkestan. The united Romans and Khazars were 70,000 men, or perhaps more, since the Khazars alone were 50,000 strong, and Heraclius led them forthwith into the province of Atropatene, where he took up his winter-quarters. He crowned the success of his arms by a most successful stratagem. After the junction of the Romans and the Khazars, Chosroes sent a despatch to Sarbar, with an order to give up all further designs against Constantinople, and to join him without delay in Persia. The messenger having fallen into the hands of the Romans, Heraclius altered the despatch, enjoining him to hold out as long as possible, and the letter was forwarded through another courier. Sarbar continued the siege, but his protracted absence irritated the king so much that he despatched a second messenger to the first lieutenant of Sarbar with an order to kill his general as a traitor. The despatch having been delivered to Sarbar instead of his lieutenant, he added the names of 400 of the principal officers as being all destined to be sacrificed to the anger of their master, whereupon he showed them the order, and declared the only way to save themselves was to break their allegiance to Chosroes and to make peace with the emperor on their own account. The officers gave their consent, they persuaded the army to follow their example, and Heraclius having granted them favourable conditions, they laid down their arms, and abandoned Chosroes at a moment when he stood most in need of them. There is something strange in this story, and it would seem as if Heraclius had not so much a hand in it as Siroes, the son of Chosroes, who rebelled against his father, and put him to death in 626.

In spite of this loss Chosroes had still a numerous army to oppose Heraclius in the campaign of 627. But his efforts were in vain. With irresistible power the Roman emperor moved on upon Assyria, and although his progress was slow, he was successful in every siege and engagement. He came from the province of Atropatene, passed the Zabas (Great Zab) in its upper part, and marched towards Niniveh (opposite Mósul), where he encountered a Persian army commanded by Rhazater, who had followed the emperor for some time, but gained some marches over him, and had taken a position near the ruins of Niniveh with the intention of preventing the Romans from occupying the valley of the Tigris and marching upon Ctesiphon. After an obstinate resistance from daybreak till night Rhazater was routed and killed, and Heraclius, who had again signalled himself as a general and a warrior, pursued the fugitive enemy, and occupied the bridges over the Great and the Little Zab, which the Persians had no time to secure. The battle at Niniveh was fought on the 12th of December 627. On his way to Dastagerd or Artemita, Heraclius took, plundered, and destroyed the royal palaces of Rusa, Beglali, and others, and immense treasures fell into his hands. Soon afterwards he took Dastagerd, the favourite residence of Chosroes, and its treasures, of which Theophanes gives a fabulous description; and many thousands of captive Romans, chiefly inhabitants of Edessa and Alexandria, as also 300 standards and other trophies taken from the Romans in former campaigns, were recovered by the victors. Chosroes fled from Dastagerd to Ctesiphon (El-Modain), and thence into the interior of Persia. Heraclius was already in sight of Ctesiphon, when he suddenly retreated north-east upon Siazura (Sherúr) and Gandzaca, crossing the Assyrian mountains in the midst of winter without loss. The motives of his retreat were either the fear of being unable to take the well-fortified city of Ctesiphon in the winter, the want of provisions in Assyria, which had been ravaged, being already very sensibly felt, or perhaps the rebellion of Siroes against his father Chosroes, whom he treacherously seized and put to death with eighteen of his sons, the brothers of Siroes. (February 28, 628.) In the month of March following peace was concluded between Siroes and Heraclius. Siroes ceded Syria, Egypt, Mesopotamia, and Armenia, and gave back the Holy Cross taken by his father at the conquest of Jerusalem; and Heraclius gave up many thousand Persian captives, and allowed the Persian troops who still occupied the principal towns of Egypt, Syria, and Mesopotamia to return to their native country: they were treated with great humanity on their march through the Roman provinces. In the same year Heraclius had his triumphal entrance into Constantinople. Theophanes, so vague and obscure in his accounts of the first campaigns

of Heraclius, gives a detailed and accurate description of the campaign of 627. The latter years of the reign of this emperor were passed amidst theological controversies. Heraclius supported the doctrine of the Monothelites, who taught that the human nature in Jesus Christ was entirely passive under the will of his divine nature. Pope John IV. assembled a council at Rome in 640, which condemned the Monothelites. Meantime the Arabians, after the death of Mohammed, and under the kalifate of Abu-Bekr, invaded Syria, Palestine, and Mesopotamia, and under the following kalifate of Omar they conquered Egypt and Cyrenaica. Heraclius was unable to oppose the torrent of Arabian courage and fanaticism; he sunk into inactivity and sloth, and died of the dropsy in February 641, after a reign of thirty years. From that epoch the decided though gradual decline of the Eastern empire may be dated. Heraclius was succeeded by HERACLIUS CONSTANTINE, his son by his first wife Eudocia, who in the fourth month of his reign was poisoned by his stepmother Martina, who had her own son Heracleonas proclaimed in his stead. An insurrection however soon after broke out at Constantinople against the new emperor, who was mutilated and banished together with his mother, and Constans II., son of Heraclius Constantine, was raised to the imperial throne.

Coin of Heraclius.

British Museum. Actual size. Gold. Weight 69 grains.

HERBERT, JOHANN FRIEDRICH, a distinguished German philosopher, was born in 1776, at Oldenburg, where his father at the time held an office connected with the administration of justice. Receiving his religious instruction from a man well acquainted with the philosophical systems of Leibnitz and Kant, Herbert, at the age of about twelve, was led to speculate upon such subjects as God, freedom, and immortality. In his eighteenth year he went to the University of Jena, where he studied under Fichte, and formed an intimate acquaintance with him, and he entertained the highest opinion of his master until Schelling's work, 'Vom Ich,' fell into his hands, which was admired by Fichte, while Herbert opposed its tendency with the greatest zeal. This caused a breach between Fichte and Herbert, who gladly accepted a place of private tutor which was offered to him at Bern in Switzerland. He had already conceived the idea of a system of psychology based upon mathematics, and the more clearly Fichte explained his views upon psychology in his 'Sittenlehre' (Leipzig and Jena, 1798), the more Herbert became convinced that the speculations of Fichte must be abandoned if any permanent basis was to be gained for his science. About the same time he devoted himself with great zeal to the study of the history of ancient philosophy, which led him to form an intimate acquaintance with the systems of Plato and the Eleatics. However he continued his own researches which he had commenced under Fichte, and from 1802 to 1805 he delivered philosophical lectures in the University of Göttingen, where he developed his peculiar method of thinking, which was subsequently much extended, but remained essentially the same as it had been from the beginning. His tendency was pre-eminently practical, and it was partly owing to this circumstance, and partly to his personal acquaintance with Pestalozzi, that his first works treated on education. In 1809 he was appointed professor of philosophy at Königsberg, and was at the same time entrusted with the superintendence of the higher educational establishments in the eastern parts of Prussia, in the organisation of which he did great service. In 1833 he was invited to the chair of philosophy in the University of Göttingen, where his lectures attracted great attention on account of the clearness and precision with which he explained his views. He remained at Göttingen until his death, on the 14th of August 1841.

Herbert is the founder of a particular system of philosophy, which is interesting on account of his peculiar method rather than his originality of thought, for in reality his system is of a syncretic kind, and Fichte's influence upon it cannot be mistaken. Although Herbert occasionally professes to be a follower of Kant, still he is of opinion that Kant's 'Criticism of Pure Reason' is almost without any objective value, and that its method must be entirely abandoned if metaphysics are to be founded on a secure and permanent basis. Herbert's realistic tendency further reminds us of the monades of Leibnitz. Philosophy, according to Herbert, has not, like ordinary sciences, any particular set of subjects which are its province, but it consists in the manner and method in which any subject whatsoever is treated. The subjects themselves are supposed to be known, and are called by him 'notions' (Begriffe), so that philosophy is the methodical treatment and working out of these 'notions.' The different methods of treatment constitute the main departments of philosophy. The first of

them is logic, which considers the nature and clearness of notions and their combinations. But the contemplation of the world and of ourselves brings before us notions which cause a discord in our thoughts. This circumstance renders it necessary for us to modify or change those notions according to the particular nature of each. By the process of modification or change something new is added, which Herbart calls the supplement or complement (*Ergänzung*). Now the second main department of philosophy is metaphysics, which Herbart defines to be the science of the supplementary notions. The method of discovering the supplementary notions which are necessary in order to render given facts which contain contradictory notions, intelligible, is, according to him, the method of relations, and it is by this method alone that the other notions of the world and of ourselves can be properly defined. Hence arises what he calls practical metaphysics, which is subdivided into psychology, the philosophy of nature, and natural theology. A third class of notions, lastly, add something to our conceptions, which produces either pleasure or displeasure, and the science of these notions is aesthetics, which, when applied to given things, forms a series of theories of art, which may be termed practical sciences. They are founded upon certain model notions, such as the ideas of perfection, benevolence, malevolence, justice, compensation, equity, and the like. In his metaphysics Herbart points out three problems containing contradictions, viz. things with several attributes, change, and our own subjectivity (*das Ich*). In order to solve these contradictions, and to make the external and internal world agree and harmonise so as to become conceivable, he assumes that the quality of everything existing (*des Seienden*) is absolutely simple. Things therefore which exist have no attributes referring to space and time, but they stand in relation to a something, which is the essence of things. Wherever this essence consists of a plurality of attributes, there must also be a plurality of things or beings, and these many simple things or beings are the principles of all things in nature, and the latter, consequently, are nothing but aggregates of simple things. They exist by themselves in space so far as it is conceived by our intellect, but not in physical space, which contains only bodies. We do not know the real simple essence of things, but we may acquire a certain amount of knowledge concerning internal and external relations. When they accidentally meet in space they disturb one another, but at the same time strive to preserve themselves; and in this manner they manifest themselves as powers, although they neither are powers nor have powers. By means of these principles Herbart endeavours to reform the whole system of psychology which he found established by his predecessors; for, according to him, the soul too is a simple being, and as such it is and remains unknown to us; and it is neither a subject for speculation nor for experimental psychology. It never and nowhere has any plurality of attributes, nor has it any power or faculty of receiving or producing anything; and the various faculties usually mentioned by psychologists, such as imagination, reason, &c., which sometimes are at war and sometimes in concord with each other, are, according to Herbart, mere fictions of philosophers. In like manner he denies that it possesses certain forms of thought or laws regulating our desires and actions. The soul as a simple being, and in its accidental association with others, is like the latter subject to disturbance and exerts itself for its own preservation. The latter point is the principal question in Herbart's psychology, and he endeavours to deduce and calculate the whole life of the soul, with the aid of mathematics, from those mutual disturbances, checks, and from its reactions against them. Hence he is obliged to deny man's moral or transcendental freedom, although he allows him a certain free character. He maintains the immortality of the soul, because the simple principles of all things are eternal; but he denies the possibility of acquiring any knowledge whatever of the deity.

These theories, which betray a tendency to subtleties and over-refinement, are explained more fully in his works, of which the principal are contained in the following list:—1, '*Pestalozzi's Idee eines A. B. C. der Anschauung, untersucht und wissenschaftlich entwickelt*,' Göttingen, 1802, 8vo. 2, '*Allgemeine Paedagogik*,' Göttingen, 1808, 8vo. 3, '*Allgemeine Practische Philosophie*,' Göttingen, 1808, 8vo. 4, '*Hauptpunkte der Metaphysik*,' Göttingen, 1808, 8vo. 5, '*Einleitung in die Philosophie*,' 1813, an improved edition appeared in 1816. 6, '*Kleines Lehrbuch zur Psychologie*,' Göttingen, 1815, 8vo. 7, '*Ueber meinen Streit mit der Metaphysik dieser Zeit*,' Königsberg, 1814. His great psychological work, however, is 8, '*Psychologie als Wissenschaft, neu gegründet auf Erfahrung, Metaphysik, und Mathematik*,' Königsberg, 2 vols. 8vo, 1824-25. 9, '*Allgemeine Metaphysik, nebst den Anfängen der Philosophischen Naturlehre*,' Königsberg, 1828-29, 2 vols. 8vo. 10, '*Kurse Encyclopaedie der Philosophie, aus practischen Gesichtspunkten entworfen*,' Königsberg, 1831, 8vo. His smaller essays appeared in three volumes, Leipzig, 1842-43, 8vo; the first volume contains a good *Life of Herbart*.

(*Neuer Nekrolog der Deutschen*; Brockhaus, *Conversations-Lexikon*.)

HERBELOT, BARTHELEMI D', was born at Paris, on the 14th of December 1625. He commenced the study of the Oriental languages in early life, and acquired an accurate knowledge of the Arabic, Hebrew, Syriac, Persian, and Turkish languages. During his residence in Italy, whither he went with the hope of obtaining

instruction from natives of the east, he enjoyed the friendship and patronage of the cardinals Barberini and Grimaldi; and on his return to France he received a pension from Fouquet of 1500 livres, which he afterwards lost on the disgrace of that minister. He was subsequently appointed Oriental secretary and interpreter to the king. During a second visit which he made to Italy he was received in the most distinguished manner by Ferdinand II, grand-duke of Tuscany, who presented him with a great number of valuable Oriental manuscripts, and wished to retain him at his court. But D'Herbelot was prevailed upon by the solicitations of the minister Colbert to return to Paris, where he was appointed professor of Syriac on the death of Auvergne. He also received a pension from the king. He died on the 8th of December 1695.

The work by which D'Herbelot is known to posterity is entitled '*Bibliothèque Orientale, ou Dictionnaire Universel, contenant généralement tout ce qui regarde la connoissance des peuples de l'Orient*,' fol., Paris, 1697. This work, which he commenced in Italy, and upon which he employed the labour of many years, was published after his death by Galand. The '*Bibliothèque Orientale*' was founded upon the Arabic dictionary of Haji Khalfa, and has been deservedly considered by scholars as a most extraordinary work for the time in which it appeared. D'Herbelot also drew his materials from numerous other works in Arabic, Persian, and Turkish, which are enumerated by Galand in his preface to the '*Bibliothèque*.' On many subjects connected with Oriental history and antiquities the '*Bibliothèque Orientale*' supplies the only information which is available at the present day to a person unacquainted with the Oriental languages. But its statements must be received with great caution; for while the learned author appears to have had a most extensive knowledge on all subjects connected with the east, he certainly did not pay sufficient attention to accuracy. It should however be recollected that he did not live to complete the work, and that his plan embraced too great a number of subjects to allow any one individual to do justice to them all.

The '*Bibliothèque Orientale*' was reprinted at Maestricht, fol., 1776, and also at the Hague, 4 vols. 4to, 1777-99. The latter edition contains many valuable additions by Schultens and Reiske, and also a supplement by Visselton and Galand. An abridgement of the original work was published at Paris, 6 vols. 8vo, 1782, by Désessarts. A German translation of the '*Bibliothèque Orientale*' was published at Halle, by Schulz, 4 vols. 8vo, 1785-90.

D'Herbelot also wrote several other works, which have never been published. Amongst these Galand mentions a Turkish and Persian Dictionary, in 3 vols. folio.

HERBERT, EDWARD, LORD HERBERT OF CHERBURY, was born in the year 1581, at Montgomery, in the principality of Wales. After going through the usual course of studies at Oxford, where he was a member of University College, Herbert visited London in 1600, and shortly afterwards proceeded to the Continent with the design of seeing foreign parts, but was induced by an inherent love of enterprise and danger to join the English auxiliaries then serving in the Netherlands, where he soon distinguished himself by his reckless daring and intrepidity. Having returned to England, he was, upon the accession of James I., created a knight of the Bath, and was distinguished at the court of that pedantic monarch by his gallantry and his learning. In 1618 Sir Edward was sent ambassador to France. In this situation the bold independence with which he answered a haughty remark of the Connétable De Luynes brought upon him the displeasure of the French monarch, at whose request he was recalled. The conduct of Herbert met however with the approbation of James, who, upon the death of De Luynes, sent him in a similar capacity to Paris, where he published his first work, entitled '*Tractatus de Veritate, prout distinguitur à Revelatione, à Verisimili, à Possibili, et à Falso*,' 4to, Paris, 1624. The year following he returned to England, and was created a baron of the kingdom of Ireland. From this date Lord Herbert does not appear to have held any public office, and his time was divided between the gaieties of the court and the pursuits of literature. In 1631 he was elevated to an English peerage, and two years after published an enlarged edition of the '*Tractatus*,' of which another appeared in 1645, accompanied with the treatise '*De Religione Gentilium, Errorumque apud eos Caussis*.' Upon the outbreak of the political troubles under Charles I., Lord Herbert at first took the side of the parliament, which however he subsequently abandoned. He died in the year 1633. After his death two posthumous works were published, the '*Expediit Buckinghami Ducis in Ream Insulam*,' and the '*Life and Reign of King Henry VIII.*,' with a dedication to the first Charles. It is by the latter work that Lord Herbert is best known to posterity. His Memoirs, which are the earliest instance of autobiography in our language, remained in manuscript until they were printed, in 1764, by Horace Walpole, at his private press at Strawberry Hill.

Herbert of Cherbury was the contemporary of Hobbes of Malmesbury, to whose principles of philosophising he was directly opposed, notwithstanding the striking coincidence of many of the results at which they respectively arrived. He maintained the theory of innate ideas, and made a certain instinct of the reason (*rationalis instinctus*) to be the primary source of all human knowledge. Accordingly he did not, with Aristotle and the Stoics, compare the mind to a pure

tablet, or to the tabula rasa of the schoolmen, but to a closed volume which opens itself at the solicitation of outward nature acting upon the senses. Thus acted upon, the mind produces out of itself certain general or universal principles (common notions), by reference to which all debatable questions in theology and philosophy may be determined, since upon these principles at least all men are unanimous. Consistently with these views, he does not, with Hobbes, make religion to be founded on revelation or historical tradition, but upon an immediate consciousness of God and of divine things. The religion of reason therefore, resting on such grounds, is, he argues, the criterion of every positive religion which claims a foundation in revelation. No man can appeal to revelation as an immediate evidence of the reasonableness of his faith, except those to whom that revelation has been directly given; for all others, the fact of revelation is a matter of mere tradition or testimony. Even the recipient of a revelation may himself be easily deceived, since he possesses no means of convincing himself of the reality or authenticity of his admitted revelation. Herbert made his own religion of reason to rest upon the following grounds:—There is a God whom man ought to honour and reverence; a life of holiness is the most acceptable worship that can be offered him; sinners must repent them of their sins, and strive to become better; and after death every one must expect the rewards or penalties befitting the acts of this life.

Lord Herbert is one of the numerous instances on record of the little influence which speculative opinions exercise upon the conduct of life. Maintaining that no revelation is credible which is imparted to a portion only of mankind, he nevertheless claims the belief of his hearers when he tells them that his doubts as to the publication of his work were removed by a direct manifestation of the divine will. Notwithstanding the little favour which has been shown to his works, which is partly indeed attributable to the obscurity both of his style and diction, but chiefly to the predominant inclination for the empirical philosophy of Bacon and Hobbes, the skill and sagacity with which he has pursued his researches on a purely rational method are alone sufficient, even had we not a Gleaner and a few others to boast of, to refute the objection which has been urged against us of a total absence in the national mind of all pure and reflex reasoning. The doctrine that outward objects are but the occasions of educating all general knowledge is the foundation of the fame of Kant; and there is much also in the writings of Jacobi which reminds the reader of the principles and method of the philosopher of Cherbury.

HERBERT, GEORGE, born April 3, 1593, was the fifth brother of Lord Herbert of Cherbury. He was educated at Westminster, and elected thence to Trinity College, Cambridge, about the year 1608. In 1615 he became Fellow of the college, and in 1619 was elected to the office of public orator, a post in those times of considerably more importance than at present. While at Cambridge he made the acquaintance of Lord Bacon, but the pleasures of the court and some hopes of preferment led him to spend much of his time away from that seat of learning. His expectations however failing on the death of James I., he turned his attention to divinity, of which he had before been a laborious student, and took holy orders. He was made prebendary of Leighton Bromswold, or Layton Ecclesia, in 1626. He married in 1630, and in the same year accepted the rectory of Bemerton; but the effects of a quotidian ague, which had attacked him the year before, soon made themselves again apparent, and he died in 1632. His poetical works are well and deservedly known. Under a quaint guise they convey sometimes profound and very often beautiful thoughts. They belong to the same school with those of Donne, Quarles, and Herrick, and remind us forcibly of certain poems which some years ago appeared at Oxford under the title of 'The Christian Year,' and the same analogy may be traced between that school of divines to whom these poems are owing and our author; there is the same zeal and energy in pastoral duties, the same love of paradox in language, the same reverence for antiquity and for the ceremonies of the Church.

Herbert's chief prose work is 'The Priest to the Temple,' a sequel to his work called 'The Temple: Sacred Poems and Private Ejaculations.' It lays down rules, and very good rules, for the life which a country clergyman ought to lead. He also wrote a translation of Cornaro 'On Temperance,' and some Latin poems.

(Isaac Walton, *Life of Herbert*.)

HERBERT, JOHN ROGERS, R.A., was born in 1810 at Malden in Essex. Having passed through the Royal Academy as a student, he for some years practised portrait-painting. In 1835 he had a picture entitled 'Prayer' in the Academy exhibition; but he first attracted attention by one originally exhibited at the British Institution called 'The Appointed Hour'—a young lover lying assassinated at the foot of the stairs down which his mistress, to whom his fate is unknown, is descending to meet him: a "telling" incident, which, when the picture was engraved, caused the print to become an exceedingly popular one. His studies in Italy led Mr. Herbert about this time to paint numerous subjects from Venetian history, as the 'Brides of Venice,—Procession of 1523' (1839), 'Pirates of Itria bearing off the Brides of Venice,' &c., and he made numerous drawings of Venetian subjects for engraving in one or more of the annual publications, then so much in request. But his pencil was by no means confined to Venetian subjects, he having exhibited among others, some

of a melodramatic character, corresponding to his 'Appointed Hour,' as 'Constancy—Love outwatched the drowy Guard,' &c., and in a different style, 'The Monastery in the 14th century—Bear Hunters refreshed at St. Augustine's Monastery, Canterbury.'

In 1841 Mr. Herbert was elected A.R.A., but somewhat earlier a circumstance had occurred (too publicly announced, and too often referred to, to make mention of it here improper) which probably had a far more powerful influence on his character as a painter than the acquisition of the academic honours; this was, his passing over with his family to the Romish Church, having been led thereto, as is generally said, by the influence of that zealous Roman Catholic and mediævalist, the late Welby Pugin. From that time Mr. Herbert's style of painting and choice of subjects underwent a very marked change. He turned to the Scriptures or to ecclesiastical history for his themes, and he treated them in a mediæval manner,—somewhat hard, but with great purity and refinement of feeling, and with conscientious attention to costume and to details. He was, in fact, the first English painter of ability, who seemed to have looked to the modern German, rather than the great Italian masters for guidance. He has since considerably modified his style, but he still loves to paint scriptural subjects as they may be imagined to present themselves to the mind of a Romish ecclesiastic, well imbued with church traditions, deep in missal and symbolic lore, but equally well acquainted with the fruits of recent investigations. The results of his new views and studies, appeared in the exhibition of 1842, to which he contributed a very remarkable work,—'The First Introduction of Christianity into Britain,' and a portrait of Dr. Wiseman. In 1843 appeared 'Christ and the Woman of Samaria'; in 1844 'Sir Thomas More and his Daughter,' for the Vernon collection, and 'The Trial of the Seven Bishops'—an old-standing commission we believe, but at any rate the picture presented an almost ludicrous contrast to other works in his recent manner; in 1845 'St. Gregory teaching his chant to the Roman Boys'; 1846, a portrait of his friend Pugin; in 1847 'Our Saviour subject to his Parents at Nazareth'—one of the most characteristic of his works; and in 1848 'St. John the Baptist reproving Herod,' also a work of great power.

Thus far Mr. Herbert's pictures for the last six years had been all of a similar order. In 1846 he had been elected an academicien, and now, 1848, he was called upon by the Royal Commission to assist in decorating the new palace at Westminster—a circumstance which gave a somewhat new direction to his pencil, and perhaps a not unuseful diversion to his thoughts. To him was assigned the painting of certain spaces in the Poet's Hall, with subjects from Shakspeare's 'King Lear.' In 1849 he exhibited at the Academy his study in oil for the first of them—'Lear disinheriting Cordelia,'—a second—a large and highly finished oil picture, 'Lear recovering his Reason, at the sight of Cordelia,' was exhibited in 1855: both were works of a high order of merit. So well satisfied were the commissioners with his first frescoes, that they have since directed him to execute nine fresco paintings on the walls of the Peers' Robing Room, the subjects being taken from the Old Testament—a commission honourable to all concerned, and one which affords to the painter an opportunity he is well qualified to turn to profit. The pictures are to represent 'Moses bringing down the Tables of the Law to the Israelites'; 'The Fall of Man'; 'Man's Condemnation to Labour'; 'The Judgment of Solomon'; 'The Visit of the Queen of Sheba'; 'The Building of the Temple'; 'The Judgment of Daniel'; 'Daniel in the Lion's Den'; and 'The Vision of Daniel.' Since his employment on the House of Lords, Mr. Herbert has found time to paint but few works for the Academy exhibitions. Besides those mentioned above his only contributions have been—'The Outcast of the People' (1849); 'Study for the Judgment of Daniel,' and a 'Head of a Scribe'—both studies for the frescoes in the Peers' Robing Room; and a very peculiar portrait of the great French painter Horace Vernet in 1855.

Mr. Herbert's eldest son, ARTHUR JOHN HERBERT, contributed to the Royal Academy Exhibition, 1855, a somewhat quaint but very promising picture entitled 'Don Quixote's first impulse to lead the life of a Knight-errant'; and to that of 1856 one of 'Philip IV. of Spain knighting Velasquez,' a work displaying greatly increased power; but unhappily the promise was cut short by the young artist's premature death of typhoid fever, at Muriac, in Auvergne, September 18th, 1856, at the age of twenty-two.

*HERBERT, RIGHT HON. SIDNEY, M.P. for South Wilts, second son of the eleventh Earl of Pembroke, by a daughter of the late Count Woronzow of Russia, was born in 1810. He received his education at Harrow and at Oriel College, Oxford, where he graduated in classical honours in 1831. He first entered public life in December 1832 as member for the southern division of Wilts, for which he has continued to sit without interruption down to the present time (October 1856). His parliamentary career exhibits an apt illustration of the gradual tendency of thinking minds to liberalise their political opinions, and to abandon narrow prejudices for wider and more enlightened principles. In 1834 he made his first speech in the House of Commons, when he seconded a resolution for the exclusion of Dissenters from the University of Oxford. In 1838 he opposed the motion of Mr. Grote in favour of the ballot, and strenuously opposed all the measures of the Melbourne ministry down to its fall in the year 1841, including the motions on the affairs of Spain and on the opium trade and war with

China. In the autumn of 1841 the late Sir Robert Peel came into power, and shortly afterwards began to entertain and to avow a conviction that the existing corn-laws were wrong in principle. Mr. Herbert followed Sir Robert Peel in this modification of his views, though he had opposed the measure of the Whig government to substitute for the sliding scale an eight-shilling fixed duty on the importation of foreign corn, as well as Lord John Russell's proposal for a reduction of the duties on foreign sugar. On the accession of Sir Robert Peel, Mr. Herbert became secretary to the Admiralty, which post he held till 1845, when he accepted the office of secretary-at-war with a seat in the cabinet. In 1846 he supported the commercial and financial reforms, introduced by Sir Robert Peel, in order to pave the way for the repeal of the corn-laws and the introduction of the free-trade principle in our commercial legislation. In March 1845, when Mr. Cobden moved for a select committee on the corn-laws, Mr. Herbert was selected to expound the views of his political leader, which he unfolded more completely, in January 1846, on the motion of Sir Robert Peel for a committee of the whole house on the Customs and Corn Importation Acts. Having remained in opposition during the premierships of Lord John Russell and Lord Derby, on the accession of Lord Aberdeen to power in December 1852, Mr. Herbert, who had been sworn a privy councillor, resumed the post of secretary-at-war, which he resigned in the early part of 1855, upon a re-construction of the cabinet, consequent on the retirement of the Duke of Newcastle, and held the secretaryship of the colonies for a few weeks under the administration of Lord Palmerston. This post however he relinquished, retiring from the government, in conjunction with one or two other members of the Peelite party, on account of the censure on the Aberdeen cabinet, which he considered to be implied in the appointment of the committee of inquiry into the state of the army before Sebastopol. Since that time he has kept aloof from the political world, devoting much of his time, talents, and attention to the organisation of schemes of social benevolence and general utility. Mr. Herbert has erected at Wilton, near Salisbury, a beautiful church in the Romanesque or Lombardic style, which is perhaps the finest specimen of Italian ecclesiastical architecture in this country. In 1846 he married a daughter of General A'Court, and niece of Lord Heytesbury.

HERBERT, SIR THOMAS, was born at York about 1608, and entered Jesus College, Oxford, in 1621, whence he removed to Trinity College, Cambridge. In 1626 he went abroad in the suite of Sir Dodmore Cotton, ambassador from Charles I. to the Shah of Persia, through the interest and at the expense of his kinsman, William Herbert, earl of Pembroke, a man of cultivated and elegant talents, and a generous encourager of learning. He sailed to Surat, thence to Ormus, traversed Persia northward to the Caspian Sea, and returned by Ispahan and Baghdad, down the Tigris; then proceeded to the coast of India, near Surat; visited (or at least described) the Straits of Malacca, Java, Pegu, the Molucca islands, &c.; and returned to England after four years' absence. In 1634 he published his 'Some Years' Travels into Africa and Asia the Great,' &c. (revised and enlarged by the author in 1638), which is an accurate and trustworthy work, and the best account of Persia anterior to that of Chardin. It contains a great many curious facts which the reader will hardly find anywhere else. The work was translated into Dutch by Van Vliet, and re-translated into French by Wicquefort. The English edition is ornamented with a great many cuts. [CHARDIN, SIR JOHN.] Herbert espoused the cause of the parliament, and in 1647 was one of the commissioners appointed to receive the king from the Scots at Newcastle. In that capacity he attended the king to Holdenby Castle, and was selected by him, on the dismissal of his former attendants, to be about his person. Though, being a Presbyterian, he was opposed in religion as well as politics to the opinions of Charles, still the respectful propriety of his behaviour won the regard of the royal prisoner, towards whom Herbert in his turn appears to have conceived a strong veneration and affection. He attended him to the last; and after the restoration his faithful service was rewarded by Charles II. with the title of baronet. In 1678 he published 'Threnodia Carolina,' an historical account of the two last years of the life of King Charles I., by Sir Thomas Herbert and others, reprinted by Nicol in 1813. He died at York in 1682. (*Athena Ozonienses*, where there is an original account of the last days and burial of Charles I., communicated to Wood by Herbert himself.)

HERCULES (in Greek, Heracles), a celebrated hero of Greek mythology, the offspring of Zeus by Alcmena, daughter of Electryon, a son of Perseus, and king of Mycenæ. His reputed father was Amphitryon (son of Alcæus, another of the children of Perseus), who having accidentally killed his father-in-law Electryon, was compelled to leave Mycenæ, and take refuge in Thebes: here Hercules was born and educated, and here his early feats of strength and valour were done, such as slaying the lion of Cithæron, delivering Thebes from the tribute to Erginus, king of Orchomenos, and taking in marriage the daughter of Creon.

Being fated to serve Eurystheus, king of Mycenæ, he performed what are called his labours, in obedience to the commands of his master. They are so well known that we need only enumerate them: the first was to bring the skin of the Nemean lion; the second, to destroy the Hydra; the third, to catch the hind of Artemis; the fourth, to bring to Eurystheus the Erymanthian boar alive; the fifth,

to cleanse the stables of Augeas; the sixth, to drive away the water-fowl of Lake Stymphalis; the seventh, to fetch the Cretan bull; the eighth, to bring to Mycenæ the mares of Diomedes; the ninth, to obtain the girdle of Hippolyta, queen of the Amazons; the tenth, to bring the oxen of Geryon from the island of Erythia; the eleventh, to bring the apples of the Hesperides; the twelfth, to conduct Cerberus from the under world. Many other exploits did he perform, such as the taking of Troy, which are all related by the mythologists, Apollodorus and others. But we have already gone into somewhat unnecessary detail, as our object will rather be to point out the classes to which these traditions belong, than to give our readers information with which they can supply themselves elsewhere.

There are then three distinct kinds of tradition relating to Hercules: the first consisting of stories drawn from some eastern or other religion and applied to the Theban hero. Such are his wanderings round the coasts of Greece, which exhibit in a mythical form the establishment of the worship of a wandering god of the Phœnicians. Such also is his voluntary death on Mount Eta; and, according to Müller ('Dorians,' i. 444), his murdering his children. Another, and the second class of traditions, are those which represent him performing labours such as would naturally be those of a young community, (Pausan., viii. 14.) A third class exhibits him in the light of a conqueror and destroyer of tyrants, and here the awkwardness of ascribing the deeds of the Peloponnesian hero to the Theban Hercules is most striking; for while on the one hand he is serving Eurystheus as a slave, on the other he appears as one who forms alliances and disposes of kingdoms.

But this is all legendary; his connection with biography and history consists in his being the assumed ancestor of the Heraclidæ. According to tradition, after the death of Hercules his children took refuge in Attica, in order to escape the persecution of Eurystheus. They were hospitably received by Theseus, and with the assistance of the Athenians defeated Eurystheus. After the battle the Heraclidæ are said to have obtained possession of the whole of the Peloponnesus; but they had not remained in the country long before a pestilence again drove them back to Attica. They attempted soon afterwards to march again into the Peloponnesus, but were met at the Isthmus by an army consisting of Arcadians, Ionians, and Achæans. In a single battle with Echemus, king of Tegea, Hyllus, the eldest son of Hercules, was slain, and the Heraclidæ promised not to invade the Peloponnesus for a hundred years from that time. (Herod., ix. 26; Pausan., i. 41.) They did not however observe their engagement, for both Cleodæus, son of Hyllus, and his grandson Aristomachus, renewed the attempt, but without success. The Heraclidæ retreated to Doris, where they obtained a considerable army to assist them in the recovery of their dominions. With the aid of an Ætolian chief named Oxylyus, they crossed from Naupactus to the southern side of the Corinthian Gulf eighty years after the Trojan war (Thucyd., i. 12.) A battle took place between the Dorians under the command of the sons of Aristomachus and the Peloponnesians under that of Tisamenus, the grandson of Agamemnon, in which the latter were defeated, and all the Peloponnesus, except Arcadia and Achæa, fell into the hands of the Heraclidæ. Elis was assigned to Oxylyus, and the rest of the Peloponnesus was divided between the three sons of Aristomachus: Temenus obtained possession of Argos; Cresphontes of Messenia; and Aristodemus, or his sons Eurysthenes and Procles (for according to the general tradition Aristodemus did not live to enter the Peloponnesus), of Laœdæmon. The land of the conquered country was divided among the Dorians, and the old inhabitants were obliged to emigrate, or were reduced to an inferior caste. (Pausan., ii. 18; iii. 1; iv. 3.)

Such is the traditional account of that important event in Grecian history, usually called 'the return of the Heraclidæ,' by which the Dorians obtained possession of the greater part of the Peloponnesus. It is asserted by the universal tradition of antiquity that the Dorians were led to this conquest by Achæan chiefs; but this fact has been doubted by many modern writers, who have considered it improbable that the Dorians should have been commanded by foreign chiefs. It has been supposed that the Heraclidæ were the hereditary princes of the Doric race, who were descended from a Dorian Hercules; and that the story of the Heraclidæ being descended from the Argive Hercules, who performed the commands of Eurystheus, was not invented till after the conquest of the Peloponnesus. (Müller, 'Dorians,' vol. i. p. 57, Eng. Trans.) Though the general tradition assigned the complete conquest of the Peloponnesus to the sons of Aristomachus, it appears probable from other traditions that the greater part of the Peloponnesus was not reduced by the Dorians till long afterwards.

(Thirlwall, *History of Greece*, vol. i. pp. 262-273.)

HERDER, JOHANN GOTTFRIED VON, was born in 1744, at Morungen, in East Prussia, where his father kept a little girls'-school. The only books he was allowed to read were a Bible and Hymn-book, though he secretly turned his attention to other works. A preacher named Trescho engaged him as a writer, and as he observed in him germs of talent, he allowed him to remain with his sons while he gave them instruction in Latin and Greek. A complaint in the eyes, with which he was afflicted, was the means of his becoming acquainted with a Russian surgeon, who was so pleased with him that he offered

to take him to Königsberg and thence to Petersburg, designing to instruct him in surgery gratis. Herder accepted the offer, but at Königsberg fainted at the first dissection which he attended, and thereupon resolved to study theology. He fortunately gained the acquaintance of persons who appreciated him, and procured him a place as instructor in the Frederick's College at Königsberg. With the most indefatigable industry he studied philosophy, natural science, history, and languages, and in 1764 became assistant at the cathedral school at Riga, to which office that also of preacher was attached. Though his sermons were greatly admired, he soon left the situation, as he desired to study the world at large. He accordingly went to France, and was there chosen by the Prince of Holstein-Oldenburg as his travelling-companion. He would have gone from France to Italy had he not been arrested by the complaint in his eyes at Strasbourg, where he first became acquainted with Göthe. In 1775 he became theological professor at Göttingen, where he was enabled to pursue his favourite studies under the benign influence of the Duke of Saxe-Weimar and his wife. He died in 1803.

The writings of Herder fill about sixty volumes, and are on the greatest variety of subjects. As a theologian he has gained celebrity by his 'Spirit of Hebrew Poetry,' as a philosopher he is known as the author of the 'Philosophy of the History of Man,' a work which has been translated into English. He was not so much a metaphysician as an observer. He strove to discover a point of union where science, religion, history, poetry, and art should meet; and in order to take one comprehensive view of all the tendencies of man, he made himself acquainted with the literature of a variety of countries, Oriental as well as European, ancient as well as modern. His collection of popular ballads of all nations has a high reputation; and a poem by him called the 'Cid' has been declared by the Spaniards themselves to be truly Spanish. The great influence which he exercised on German literature, by introducing his countrymen to the knowledge of an infinite variety of subjects, was undoubtedly great; and his name is never mentioned among them but in terms of high respect and admiration.

HERMANN, the Arminius of the Roman historians, the son of Sigimer, chief of the Cherusci, was born about B.C. 16 or 17. Being sent in early youth as a hostage to Rome, probably in consequence of the victories of Drusus, which had established the supremacy of Rome over the Catti, Cherusci, and other tribes of North Germany, he obtained the favour of Augustus, and was inscribed among the Roman knights. On his return to his native country, he conceived the project of delivering it from the Romans, whose oppression had become intolerable. Quintilius Varus, a rapacious man, was then the Roman governor in Germany. Hermann pretended to be his friend, while at the same time he kept up a secret understanding with the chiefs of the Catti, Bructeri, and other tribes that lived between the Rhine and the Albis (Elbe), some of which broke out into insurrection. Hermann offered Varus his assistance in reducing them to subjection, and thus enticed him to advance some distance from the Rhine into the interior. Varus began his march with three legions, six cohorts, and a body of cavalry, and Hermann served him as a guide through the forests. The Romans were thus drawn into an ambuscade, and found themselves all at once surrounded by numerous bodies of Germans, who were directed by Hermann himself. The Romans fought desperately; but being unacquainted with the localities, and unable to form their ranks owing to the thickness of the forests and the marshy nature of the ground, they remained exposed for two days to the missiles of the Germans, who destroyed them in detail. At last, Varus, being wounded and seeing no chance of escaping, run himself through with his sword, and the other chief officers followed his example. The legions were entirely destroyed, and the cavalry alone cut their way through the enemy and regained the banks of the Rhine. By this defeat the Romans lost all their conquests beyond that river; and although Germanicus some years after again carried their arms to the Weser, they never established anything like a solid dominion over those regions. The defeat of Varus occurred, according to various chronologists, in the year 763 of Rome (A.D. 9). The scene of the defeat is conjectured to have been in the country of the Bructeri, near the sources of the Ems and the Lippe. The news of this calamity, the greatest that had befallen the Roman arms since the defeat of Crassus, caused much alarm at Rome.

The fears however which were entertained that the Germans might invade Gaul, were not realised. L. Asprena guarded the banks of the Rhine, and the Germans were too little united among themselves to attack the empire. Augustus in the following year sent Tiberius to the Rhine with a fresh army, who does not seem to have effected anything of importance. Hermann meantime quarrelled with Segestes, chief of the Catti, whose daughter Tismelda he had carried off, and married against her father's consent. When Germanicus, after the death of Augustus, marched into the interior of Germany to avenge the defeat of Varus, he was assisted by Segestes, and also by the Chauci and other tribes. [GERMANICUS.] In the first battle against Hermann his wife Tismelda was taken prisoner by the Romans, and she afterwards figured in the triumph of Germanicus. Germanicus having reached the scene of Varus's defeat, paid funeral honours to the remains of the legions; but Hermann, who was hovering about his line of march, without coming to a pitched battle, harassed him in his retreat, and occasioned a great loss to Cascina, the lieutenant of

Germanicus. (Tacitus, 'Annal,' i.) In the following year Germanicus advanced again as far as the Virurgia, or Weser, where he found Hermann encamped ready for battle. A desperate fight took place, in which Hermann, after performing prodigies of valour, was defeated, and escaped with difficulty. When Tiberius recalled Germanicus, he observed that the Cherusci, Bructeri, and other unsubdued tribes might be left to their own internal dissensions. He seems to have guessed right, for a war broke out soon after between Hermann on one side and Maroboduus, king of the Suevi, on the other, who was accused of aspiring to absolute dominion. The Semnones and the Langobards joined Hermann, who defeated Maroboduus on the borders of the Hercynian Forest, and obliged him to seek refuge among the Marcomanni, from whence he applied to Rome for assistance. Tiberius then sent his son Drusus into the Illyricum; but the Romans did not advance beyond the Danube, and Hermann remained unmolested in Northern Germany. Shortly after however Hermann was killed by his own relatives, being accused, as it would seem, of aspiring to absolute dominion. He died at the age of thirty-seven, in the twenty-first year of our era, after being for twelve years the leader and champion of Germany.

HERMAS, a Christian writer of the first century; who is said by Eusebius ('Hist. Eccl.,' iii. c. 3) and Jerome ('De illustr. Viris,' c. 10) to have been the same individual whom St. Paul salutes in his Epistle to the Romans (xvi. 14). He was the author of a work entitled 'The Shepherd;' which is called by this name because the angel who bears the principal part in it is represented in the form of a shepherd. This work is divided into three books; of which the first contains four visions; the second, twelve commands; and the third, ten similitudes. Hermas appears to have followed the plan of the Apocalypse; which he has imitated in many parts of his work. Lardner in his 'Credibility of the Gospel History' ('Works,' vol. ii., p. 69-72) has given many instances of such imitations. Mosheim ('Eccl. Hist.,' vol. i., p. 100-1, ed. of 1826) and many other critics have maintained that the 'Shepherd' was written by Hermas, who was a brother of Pius, bishop of Rome, in the year 141.

The 'Shepherd' of Hermas is frequently quoted with the greatest respect by almost all the early Christian writers. We learn from Eusebius ('Hist. Eccl.,' iii., c. 3, 5) and other writers that it was received by many churches as a canonical work. It is quoted by Irenæus and Clement of Alexandria as a part of Scripture, and also by Tertullian, before he became a Montanist (see the passages in Lardner's 'Works,' vol. ii., pp. 188, 249, 303, 304). Origen also considered it of divine authority; but informs us that it was rejected by some churches. After the time of Origen its canonical authority appears to have been generally denied. Eusebius, Jerome, Athanasius, Rufinus, Gelasius, and Prosper expressly declare that it should not be included in the canon.

The 'Shepherd' contains no express citations of any books of the Old or New Testament. This work was originally written in Greek; but there is only an ancient Latin version of it extant. There is an English translation by Wake, London, 1693 and 1710.

(Lardner, *Works*, vol. ii., pp. 57-73; Du Pin, *Ecclesiastical History*, vol. i., pp. 26, 27; Wake, *Preliminary Discourse*, c. viii.; Tillemont, *Mém. Eccl.*, vol. ii.; Neander, *Kirchengeschichte*, vol. i.)

HERMES, GEORG, the founder of a philosophical school of Roman Catholic theology, was born on the 22nd of April 1775, at Dreyerwalde, near Münster in Westphalia, where he received his first education from the priest of the place. He subsequently became a pupil of the gymnasium at Rheina, and there gave the first proofs, especially in his mathematical lessons, of his strong mental powers. After the year 1793, he entered the theological faculty at Münster, where he devoted himself with great zeal to the study of the philosophy of Kant. In 1798 he was appointed teacher at the gymnasium of Münster, and all his exertions henceforth were directed towards restoring, on a firm basis, that which had been demolished by Kant's 'Criticism of Pure Reason.' But as a teacher at the gymnasium, he had no opportunity of making known the results of his philosophical studies. This opportunity however was offered to him in 1807, when he was appointed professor of theology at Münster. His great talent as a lecturer, and his kind and benevolent manners, attracted great numbers of students. On one occasion, when he had to give his opinion on some ecclesiastical question, he greatly offended Droste-Vischering, afterwards archbishop of Cologne, and the ill feeling thus created is thought to have had some influence in the subsequent proceedings against the doctrines and followers of Hermes. In 1819 Hermes was appointed professor of theology in the newly-established University of Bonn. His lectures again attracted students not only from all parts of Roman Catholic Germany, but the king of the Netherlands sent a large number of young men to Bonn for the special purpose of studying under Hermes. In the enjoyment of the highest esteem, both of his colleagues and pupils, he died at Bonn on the 26th of May 1831.

The only work that Hermes published bears the title 'Einleitung in die Christ-Katholische Theologie,' Münster, 1819, 8vo; a second edition appeared in 1831. So long as the Archbishop Spiegel zum Desenberg was alive, Hermes and his views were not attacked by the see of Rome; but soon after the elevation of Droste-Vischering to the archbishopric of Cologne, reports were made to Rome about the infidel tendency of Hermes's work, which still continued to be the chief theological manual

at Bonn and other German universities, where the chairs were filled by the disciples of Hermes. The denunciation against Hermes was taken up very eagerly at Rome by Perronne, who made his report to the pope. The objectionable point in Hermes's work was his principle, that reason or philosophy must in the first place prove the reality of a divine revelation, and in the second, the truth of the Roman Catholic system. These points being ascertained, Hermes demanded absolute submission to revelation. He does not attempt philosophically to prove the truth of every particular dogma, but only to show that the Church has a right to establish her dogmas, and to demand submission to them. Hermes thus did not attack a single dogma of the Church, and his orthodoxy can scarcely be disputed; but if we consider that the whole method of Hermes claimed for every theologian the right of exercising his private judgment, it will not be surprising to find that, on the 26th of September 1835, the pope issued a brief against the work of Hermes. The severity with which Archbishop Droste-Vischering carried the brief into execution produced a rupture between the courts of Berlin and Rome. The disciples of Hermes made all possible efforts to defend their master, and two of them, professors Braun and Elvenich, went to Rome to point out to his holiness that Perronne had misrepresented the views of Hermes. But their exertions were of no avail. The number of pamphlets which were written for and against Hermes was prodigious, and the controversy probably contributed not a little towards the subsequent religious movements among the Roman Catholics of Germany. The best exposition of the whole controversy may be found in Elvenich's 'Der Hermetianismus und sein Römischer Gegner Perronne,' Breslau, 1844, 8vo.

HERMOGENES, surnamed Xyster, one of the first rhetoricians of antiquity, was a native of Tarsus, and lived under Marcus Aurelius. At the age of fifteen, it is said, he was professor of Greek eloquence at Rome, where his lectures were attended by that emperor. At the age of eighteen he wrote his work on the oratorical art, consisting of four sections: 1. De Partitione Statuum et Questionum Oratoriarum. 2. De Inventione. 3. De Formis Oratoriis. 4. De Eloquentia Methodica. His illustrations and quotations are chiefly taken from the 'Orations' of Demosthenes. The work of Hermogenes was held in high esteem, and became a standard book in all Greek schools. It has been repeatedly printed in the Greek text, and Gaspard Laurent published it with a Latin translation and commentaries, 8vo, Geneva, 1614. Hermogenes had joined to his work a book of 'Progymnasmata,' or specimens of oratorical exercises, which Priscianus translated into Latin, the Greek text of which has remained inedited till the end of the last century, when it was first published by A. H. L. Heeren, and has since been republished by Veesenmeyer, 8vo, Nürnberg, 1812, and by others. At the age of twenty-five Hermogenes is reported to have entirely lost his memory, and to have lived to an advanced age in a state bordering on idiocy. (Philostratus, *Lives of the Sophists*; Suidas; Fabricius, *Bibliotheca Græca*; Schoell, *History of Greek Literature*.)

HERMOGENES, a heretic of the early church, against whom Tertullian has written a treatise, was most probably a native of Africa, and flourished, according to Basnage and Le Clerc, A.D. 168. The chief information we possess respecting him is contained in Tertullian and Theodoret. It appears from Tertullian that Hermogenes, though professedly a Christian, had throughout his life evinced a strong tendency to the doctrines of the heathen philosophers, and especially to those of the Stoics. He is accused of having taught that God made the world out of matter that was coeternal with him. The chief design of Tertullian's treatise is to confute that notion. The following, in a few words, appears to have been the system of this heretic: he asserted the eternity of matter, and that God created the universe out of it. This matter had a confused and turbulent motion, and to it he ascribed all the evils which exist in the creation. It was out of this confused matter that God brought order and perfection. He however believed in a future judgment, and, probably, most of the other great doctrines of religion, as he is not charged by either Tertullian or Theodoret with any other heresy than that to which we have alluded. We have no account of any of his writings, though it may be inferred from the arguments of his opponents that he was an author. We are ignorant of the year of his death. (For a fuller detail of his opinions see Lardner, *Hist. of Heretics*, ch. xviii.; Tillemont, *Hist. Eccl.*; and Cave.)

HERO, or HERON. There are two of this name, both writers on mechanical subjects. Hero the elder was the pupil of Ctesibius, and lived at Alexandria about B.C. 100. The country of the younger Hero is uncertain; in a work attributed to him (on 'Geodesy') he states that the precession of the equinoxes had produced seven degrees of effect since the time of Ptolemy, so that he must have been about 500 years later than Ptolemy: he is generally placed under the reign of Heraclius, A.D. 610-641.

Hero the elder must have enjoyed great reputation, since he is mentioned, by Gregory Nazianzen, with Euclid and Ptolemy: but he is now principally known by some fragments of his writings on mechanics, which are to be found in the 'Mathematici Veteres,' Paris, 1698; by the common pneumatic experiment known as 'Hero's fountain,' in which a jet of water is supported by condensed air; and by his mention of a machine, the motive-power of which is steam. His extant writings are: 1. 'On the machine called the Chiroballista,'

which is in the 'Math. Vet.' already cited. 2. 'Barulcus,' a treatise on the raising of heavy weights, which is mentioned by Pappus, and which was found by Golius in Arabic, but has not yet been printed. 3. 'Beloposica,' a treatise on the manufacture of darts, published by Baldi, with an account of Hero, at Augsburg, in 1616, and also in the 'Math. Vet.' 4. 'Pneumatics,' which contains the recently noticed description of a simple steam-engine, published by Commandine, Urbino, 1575, and Amsterdam, 1680; and also in the 'Math. Vet.' with the additions of Aleotti, who had previously published an Italian version, Bologna, 1542, and Ferrara, 1589. 5. 'On the Construction of Automata,' which is in the 'Math. Vet.' and was translated into Italian by Bernardino Baldi, with an account of the rise and progress of mechanics, Venice, 1589, 1601, 1661. 6. 'On Dioptrics,' a work said by Lambecius to exist in manuscript in the Vienna library. Other works of Hero, now lost, are mentioned by Pappus, Eutocius, Heliodorus of Larissa, &c., for which see Heilbronner, who is the authority for the preceding summary: (see also J. A. Schmidt, 'Heronis Alexandrini Vita Scripta et quædam inventa,' Helmstad, 1714, 4to.)

The writings of Hero the younger are: 1. a book 'On Machines of War,' edited in Latin by Barocius, Venice, 1572; together with, 2. a book of 'Geodesy,' a term then meaning practical geometry. 3. 'On the Attack and Defence of Towns,' printed in the 'Math. Vet.' 4. A book 'On Military Tactics,' said by Lambecius to exist in manuscript in the library at Vienna. 5. 'On the Terms of Geometry,' printed at Strasbourg, 1571; and also edited by C. F. F. Hasenbalg, Stralsund, 1826, 4to, with notes. 6. 'Geometrical Extracts,' printed by the Benedictines in the first volume of the 'Analecta Græca,' Paris, 1688, from a copious manuscript in the Royal Library at Paris. 7. A Geometrical Manuscript, stated by Lambecius to be in the library at Vienna.

There was another Heron, the teacher of Proclus.

HEROD (HERODES), the name of several Jewish princes.

I. HEROD THE GREAT was the second son of Antipater, by whom he was appointed governor of Galilee at the age of twenty-five. In B.C. 43 he obtained from Sextus Cæsar the government of all Coele-Syria. From this time he became, with his brother Phasael, the chief supporter of Hyrcanus II. against the attempts of Antigonus, the son of Aristobulus. By large presents he obtained the friendship of Antony, who appointed him and Phasael tetrarchs of Judæa. In B.C. 40 the Parthians invaded Judæa, and set Antigonus on the throne, making Hyrcanus and Phasael prisoners. Herod escaped to Rome, where, by the influence of Antony, he was appointed king of the Jews; but the Roman generals in Syria assisted him so feebly that it was not till the end of the year B.C. 38 that Jerusalem was taken by Sossius. The commencement of Herod's reign dates from the following year. In the year B.C. 38 he had married Mariamne, the grand-daughter of Hyrcanus, hoping to strengthen his power by this match with the Asmonean family, which was very popular in Judæa. On ascending the throne Herod appointed Ananel of Babylon high-priest, to the exclusion of Aristobulus, the brother of Mariamne. But he soon found himself compelled, by the entreaties of Mariamne and the artifices of her mother Alexandra, to depose Ananel, and appoint Aristobulus in his place. Not long after Aristobulus was secretly put to death by the command of Herod. Alexandra having informed Cleopatra of the murder, Herod was summoned to answer the accusation before Antony, whom he pacified by liberal bribes. When setting out to meet Antony, he had commanded his brother Joseph to put Mariamne to death in case he should be condemned, that she might not fall into Antony's power. Finding on his return that Joseph had revealed this order to Mariamne, Herod put him to death. In the civil war between Octavianus (afterwards the Emperor Augustus) and Antony, Herod joined the latter, and undertook, at his command, a campaign against the Arabs, whom he defeated. After the battle of Actium he went to meet Octavianus at Rhodes; having first put to death Hyrcanus, who had been released by the Parthians, and had placed himself under Herod's protection some years before. He also imprisoned Mariamne and Alexandra, commanding their keepers to kill them upon receiving intelligence of his death. Octavianus received him kindly, and reinstated him in his kingdom. On his return Mariamne reproached him with his intentions towards her, which she had again discovered. This led to an estrangement between Herod and his wife, which was artfully increased by his sister Salome, till on one occasion, enraged at a new affront he had received from Mariamne, Herod assembled some of his friends and accused her of adultery. She was condemned and executed. After her death Herod suffered the deepest remorse, and shut himself up in Samaria, where he was seized with a sickness which nearly proved fatal. In the year B.C. 26 he put to death the sons of Babas, the last princes of the Asmonean family. He now openly disregarded the Jewish law, and introduced Roman customs, a conduct which increased the hatred of the people towards him. Ten men conspired against his life, but were detected, and executed with the greatest cruelty. To secure himself against rebellion he fortified Samaria, which he named Sebaste, and built Cæsarea, and other cities and fortresses. In the year B.C. 17 he began to rebuild the temple at Jerusalem. The work was completed in eight years, but the decorations were not finished for many years after. (John ii. 20.) Herod's power and territories

continued to increase, but the latter part of his reign was disturbed by the most violent dissensions in his family, of which a minute account is given by Josephus. He died in March B.C. 4, in the thirty-fourth year of his reign and the seventieth of his age. Josephus relates that shortly before his death he shut up many of the principal men of the Jewish nation in the Hippodrome, commanding his sister Salome to put them to death as soon as he expired, that he might not want mourners. They were released however by Salome upon Herod's death.

The birth of Jesus Christ took place in the last year of Herod's reign, four years earlier than the era from which the common system of chronology dates the years A.D. (Clinton, 'Fasti Hellenici'.)

II. HEROD ANTIPAS, son of Herod the Great, was appointed by his father's will tetrarch of Galilee and Persea. [ARCHELAUS.] He built the city of Tiberias. About A.D. 26 he divorced the daughter of Aretas, king of Arabia, and married his sister-in-law Herodias. John the Baptist, having remonstrated against this marriage, was imprisoned in the castle of Machærus, and afterwards put to death. (Luke iii. 19, 20; Mark vi. 17-29.) About the same time Aretas marched against Antipas and defeated him. In A.D. 39 Antipas was accused by Agrippa, king of Judæa, of a secret understanding with the Parthians, and was banished by Caligula to Lyon.

III. HEROD AGRIPPA, son of Aristobulus and grandson of Herod the Great, after experiencing many vicissitudes in early life, was appointed, upon the accession of Caligula, king of the dominions formerly held by Philip, namely, Gaulanitis, Batanea, and Trachonitis, to which Caligula added the tetrarchy of Lysanias; and afterwards, when Antipas was banished, the tetrarchy of Galilee and Persea. Claudius added Judæa and Samaria to his dominions. His government was popular with the Jews, to please whom he persecuted the Christians. (Acts xii. 1-3.) He died of a loathsome disease at Cæsarea, in the third year of his reign over all Palestine, A.D. 44. (Acts xii. 20-23.)

IV. HEROD AGRIPPA, son of the above, was seventeen years old at the time of his father's death. Upon the death of Herod, king of Chalcis, four years afterwards, Claudius bestowed that kingdom upon Agrippa. He did not leave Rome till A.D. 53, when Claudius gave him the tetrarchies of Gaulanitis, Batanea, and Trachonitis. His dominions were enlarged by Nero. It was in A.D. 60 that the trial of Paul before Agrippa took place. (Acts xxvi.) Agrippa exerted himself to the utmost to keep down the spirit of revolt which was now constantly increasing among the Jews. When war broke out, Agrippa joined the Romans. After the taking of Jerusalem he retired with his sister Berenice to Rome, where he died at the age of about seventy years.

HERODES, TIBERIUS CLAUDIUS ATTICUS, a native of Marathon, in Attica, and of an illustrious family, which numbered among its members several officers and magistrates of the latter period of the Athenian commonwealth, was born under the reign of Trajan. He inherited from his father Atticus a very large property. Atticus, it is said, discovered one day in his grounds, in or near Athens, a vast treasure, probably hidden there during the preceding wars. He informed the then emperor Nerva of what he had found, and was told to do with it as he pleased. In consequence of this, Atticus left his son Herodes possessed of enormous wealth. Herodes was educated by the best teachers of his time: he studied under Favorinus and Polemon, and he became an accomplished scholar, rhetorician, and philosopher. He was made by Antoninus Pius prefect of the Greek towns of Asia. Having removed to Rome, his wealth, his connections, and his extempore eloquence, which is spoken of as wonderful, gave him a considerable degree of importance, and he was made consul with C. Bellicius Torquatus, A.D. 143. He was also one of the preceptors of the younger Verus, the adopted son of Antoninus. Herodes married at Rome Anna Regilla, of an illustrious and wealthy family. She bore him four children, and died while pregnant of the fifth. His brother-in-law suspected Herodes, who was of a violent and jealous temper, of foul treatment of his wife, and he brought him to trial on the charge of murder; but Herodes was acquitted. Herodes displayed an excessive, and, as some believed, an assumed grief for the loss of his wife, and he dedicated her estate to Minerva and Nemesis. An inscription which he wrote, or caused to be written, in Greek hexameters, records the fact. There is another inscription, likewise in Greek verse, in which the poet invites the Roman women to honour the memory of Regilla, descending upon her beauty, virtue, and high lineage: he speaks of the Emperor Marcus Aurelius, whom he compares to Jupiter, for the consolation which he administered to the widower in his old age, left with two young surviving children, upon one of whom, named Atticus, the emperor bestowed the patrician and senatorial mandala, or shoes spangled with stars and ornamented with a crescent, which custom of the Roman patricians the poet derives from Mercury. He then launches out into mythological allusions, and speaks of his own descent from the Athenian heroes and demigods. The whole composition, as well as the one previously mentioned, is curious as a memorial of the Greco-Roman style of poetry in the age of the Antonines. These two inscriptions, which are on two large slabs of Greek marble, and were discovered in the early part of the 17th century, under Pope Paul V. (Borghese), have given much employment to critics and philologists. (Visconti, 'Iscrizioni Tropee ora Borghesiane,' 4to, Rome, 1794.) Herodes, after the loss of his

wife, returned to Greece, and died at Marathon, in the seventy-sixth year of his age, towards the end of the reign of Aurelius, or the beginning of that of Commodus. He erected monuments, temples, baths, and aqueducts, in Italy, Greece, and Asia. Pausanias (vii. 20) mentions an Odeon, or Music Theatre, at Athens, as built by him, called the Theatre of Regilla, after his wife: he also embellished the Stadium, near the Ilissus, which was originally constructed by the orator Lycurgus, B.C. 350. Herodes was evidently a conspicuous personage in the age in which he lived, and is mentioned as such by Aulus Gellius, Philostratus, Capitolinus, Zonaras, Suidas, and a number of others. (Fiorillo, 'Herodis Attici quæ supersunt,' 8vo, Leipzig, 1801.) Herodes is said by Philostratus to have written orations, epistles, and ephemerides; but none of these compositions have come down to us except a fragment of an address to the Thebans, published by Reiske, Leipzig, 1773; but its genuineness is doubted by the critics. In the inscription above mentioned, in honour of his wife, he is styled "the living language of Athens," and "the king of oratory." His son Atticus is said to have been a complete idiot all his life.

HERODIANUS, a Greek author, who wrote a history, in eight books, of the Roman emperors who reigned successively in his lifetime, beginning with the death of Marcus Aurelius, A.D. 180, and ending with the accession of the younger Gordianus, in 238. This history comprehends a period of little more than half a century, but it is a most eventful one in the history of the empire, on account of the numerous and violent changes in the persons who held the sovereign power, and also with respect to the domestic and foreign wars, the depravity of manners, and the public calamities which characterised that age. The series of emperors which the history of Herodianus embraces comprises Commodus, Pertinax, Julianus, Niger and Albinus, Severus, Caracalla and Geta, Macrinus, Elagabalus, Alexander Severus, Maximus, the two Gordians, and Balbinus. The style of Herodianus is plain and unaffected, and his narrative in general seems written in a spirit of sincerity, but it has no claims to philosophy or critical art. (F. A. Wolf, 'Narratio de Herodiano et libro ejus,' prefixed to his edition of Herodianus, Halle, 1792.) Of the private history of Herodianus we know nothing, except that he seems to have lived at Rome, and to have been well acquainted not only with the political events, but also with the court intrigues and scandal of his time. He is the last of the Greek historians of antiquity who lived before the partition of the Roman empire. Among the editions of his history that of Irmisch, in 5 vols. 8vo, Leipzig, 1789-1805, in Greek and Latin, contains numerous notes, chronological and genealogical tables, and several copious indexes. The last edition and the best text is by Bekker, Berlin, 1826, 8vo. There are several German translations of Herodian.

HERODOTUS, a native of Halicarnassus, a Dorian city in Caria, and once a member of the confederation called the Hexapolis, or Six Cities, was born about B.C. 484. If the passages in his own History (i. 130; iii. 15) were written by himself, he was probably alive in B.C. 408. The facts of his life are few and doubtful, except so far as we can collect them from his own works. He was the son of Lyxus and Dryo, and of an illustrious family in his native state. Not liking the government of Lygdamis (the grandson of the heroic Artemisia), who was tyrant of Halicarnassus, he retired for a time to Samos, where

Coin of Halicarnassus.

British Museum. Actual size. Silver. Weight 56 grains.

he is said to have cultivated the Ionic dialect of the Greek, which was the language of that island. Before he was thirty years of age he joined in an attempt, which proved successful, to expel Lygdamis. But the banishment of the tyrant did not give tranquillity to Halicarnassus, and Herodotus, who himself had become an object of dislike, again left his native country, and joined, as it is said, a colony which the Athenians sent to Thurium, in South Italy (B.C. 443). He is said to have died at Thurium, and was buried in the Agora. (Suidas, 'Ἡρόδοτος, Ἡλυκαρίας, Θουκυδίδης; Strabo, xiv., p. 656; Photius, 'Bibl.,' 60.) Herodotus presents himself to our consideration in two points of view; as a traveller and observer, and as an historian. The extent of his travels may be ascertained pretty clearly from his History, but the order in which he visited each place and the time cannot be determined. The story of his reading his work at the Olympic games, which has found its way into most modern narratives, has been well discussed by Dahlmann, and we may perhaps say disproved. (Herodot., 'Aus seinem Buche sein Leben,' Altona). The story is founded on a small piece by Lucian ('Ed. Reiz.,' 4to, p. 831), entitled 'Herodotus or Aetion,' which apparently was not intended by the writer himself as an historical truth; and in addition to this, Herodotus was only about twenty-eight years old when he is said to have read to the assembled Greeks at Olympia a work which was the result of most extensive travelling and research, and bears in every part of it evident

marks of the hand of a man of mature age. The Olympic recitation is not even alluded to by Plutarch in his treatise on the 'Malignity of Herodotus' (iv., p. 481, ed. Wyttenbach). The arguments derivable from this circumstance, as to the truth or falsehood of this story, are considered by Dahlmann (p. 33). Heyse endeavours to maintain the story of the Olympic recitation, and to relieve it from some of its difficulties; but, in our opinion, not successfully. Another recitation at Athens is mentioned by Plutarch and Ensebius.

With a simplicity which characterises his whole work, Herodotus makes no display of the great extent of his travels. He frequently avoids saying in express terms that he was at a place, but he uses words which are as conclusive as any positive statement. He describes a thing as standing behind the door (ii. 182), or on the right hand, as you enter a temple (i. 51); or as he was told something by a person in a particular place (ii. 28); or he uses other words equally significant. In Africa he visited Egypt, from the coast of the Mediterranean to Elephantine, the southern extremity of the country (ii. 29); and he travelled westward as far as Cyrene (ii. 32, 181), and probably farther. In Asia he visited Tyre, Babylon, Ecbatana (i. 93), and probably Susa (v. 52-54; vi. 119). He also visited various parts of Asia Minor, and probably went as far as Colchis (ii. 104). In Europe he visited a large part of the country along the Black Sea, between the mouths of the Danube and the Crimea, and went some distance into the interior. He seems to have examined the line of the march of Xerxes from the Hellespont into Attica, and certainly had seen numerous places on this route. He was well acquainted with Athens (i. 98; v. 77, &c.), Delphi, Dodona, Olympia (ix. 81), Tegea (i. 66), Thasos, Delos, Zacynthus (iv. 195) and numerous other places in Greece. That he had visited some parts of South Italy is clear from his work (iv. 99; v. 44, 45). The mention of these places is sufficient to show that he must have seen many more. So wide and varied a field of observation has rarely been presented to a traveller, and still more rarely to any historian, either of ancient or modern times; and if we cannot affirm that the author undertook his travels with a view to collect materials for his great work, a supposition which is far from improbable, it is certain that without such advantages he could never have written it, and that his travels must have suggested much inquiry, and supplied many valuable facts which afterwards found a place in his History.

The Nine Books of Herodotus contain a great variety of matter, the unity of which is not perceived till the whole work has been thoroughly examined; and for this reason, on a first perusal the History is seldom well understood. But the subject of his History was conceived by the author both clearly and comprehensively. "The object of the inquiries (for so we may render the word *ἱστορίη*) of Herodotus of Halicarnassus is this, that the acts of war may not be forgotten through lapse of time, and that great and wondrous achievements, performed partly by Greeks and partly by Barbarians, may not be without their fame; and also how it came to pass that Greeks and Barbarians waged war together" (i. 1). His object then was to combine a general history of the Greeks and the Barbarians (that is, those not Greeks) with the history of the wars of the Greeks and Persians. Accordingly, in execution of his main subject, he traces the course of events from the time when the Lydian kingdom of Croesus fell before the arms (B.C. 546) of Cyrus, the founder of the Persian monarchy, to the capture of Sestos (B.C. 478), an event which crowned the triumph of the Greeks over the Persians.

The great subject of his work, which is comprised within this space of sixty-eight years, not more than the ordinary term of human life, advances with a regular progress and truly dramatic development, from the first weak and divided efforts of the Greeks to resist Asiatic numbers, to their union as a nation, and their final triumph in the memorable fights of Thermopylae, Salamis, and Plataea. But with this subject, which has a complete unity well maintained from its commencement to its close, the author has interwoven, conformably to his general purpose, and by way of occasional digression, sketches of the various people and countries that he had visited in his widely-extended travels. The more we contemplate the difficulty of thus combining a kind of universal history with a substantial and distinct narrative, the more we admire, not the art of the historian (for such, in the proper sense of the term, he could not well possess), but that happy power of bringing together and arranging his materials which was the result of the fullness of his information, the distinctness of his knowledge, and the clear conception of his subject. These numerous digressions are among the most valuable parts of his work, and if they had been omitted or lost, barren indeed would have been our investigation into the field of ancient history, over which the labour of one man now throws a clear and steady light. It would be difficult to mention any single writer, ancient or modern, whose personal knowledge forms so large a part of the materials of his work, and it would not be easy to name one whose accuracy of observation and felicity of description were accompanied with such singleness and rectitude of purpose. Of modern travellers Carsten Niebuhr is the only one whom we can call to mind as worthy, in this respect, to be placed by the side of the historian of Halicarnassus. But we know no complete parallel to a writer whose mere digressions elevate him to the rank of an intelligent traveller, and who could combine in harmonious union with a great historical work, designed to perpetuate the glories of his own

nation, so endless a variety of matter collected from the general history of mankind. His predecessors in historical composition appear generally to have chosen subjects of a limited nature, partaking chiefly of the character of local annals. Herodotus chose for his subject a series of events which concerned the universal Greek nation, and not them only, but the whole civilised world; and by the way in which he executed his great undertaking he has earned the honourable and well-merited appellation of the Father of History.

That he was not duly appreciated by all his countrymen, and that in modern times his wonderful stories have been the subject of merriment to the half-learned, who measure his experience by their own ignorance, we merely notice, without thinking it necessary to say more. The incidental confirmations of his veracity which have been accumulating of late years on all sides, and our more exact knowledge of the countries which he visited, enable us to appreciate him better than many of the Greeks themselves could do; and it cannot now be denied that a sound and comprehensive study of antiquity must be based upon a thorough knowledge of the Father of History.

The style of Herodotus is simple, pleasing, and generally perspicuous: often highly poetical both in expression and in sentiment. But it bears evident marks of belonging to a period when prose composition had not yet become a subject of art. His sentences are often ill-constructed and hang loosely together; but his clear comprehension of his own meaning, and the sterling worth of his matter, have saved him from the reproach of diffuseness and incoherence. His acquirements were apparently the result of his own experience. In physical knowledge he was certainly behind the science of his day. He had no doubt reflected on political questions; but he seems to have formed his opinions mainly from what he had himself observed. To pure philosophical speculation he had no inclination, and there is not a trace of it in his writings. He had a strong religious feeling, bordering on superstition, though even here he could clearly distinguish the gross and absurd from that which was decorous (i. 199). He seems to have viewed the manners and customs of all nations in a more truly philosophical way than many so-called philosophers, considering them as various forms of social existence under which happiness might be found. He treats with decent respect the religious observances of every nation, a decisive proof, if any were wanting, of his good sense.

There is no translation of Herodotus which has yet done justice to the original, and no commentary has yet exhausted one-tenth of the matter which admits and requires illustration.

The first edition of Herodotus was the Latin translation of L. Valla, fol., Venice, 1474. The first Greek edition was printed by the elder Aldus, fol., Venice, 1502; reprinted by Hervagius, fol., Basel, 1541, 1557, under the superintendence of Camerarius. The edition of Hergavius is very correct and useful. The most complete edition of Herodotus is by J. Schweighäuser, 6 vols. 8vo., Strasbourg, 1816. Since that time Professor Gaisford has again collated the Sanctroft manuscript (one of the best manuscripts of Herodotus) for his edition of Herodotus (Oxford, 1824), but the result of the collation has added nothing of any value to the text of Schweighäuser. The differences between the text of Schweighäuser and Gaisford are shown in the reprint of Schweighäuser, by Taylor and Walton, London, 1830 and 1838. An exceedingly valuable edition is that of the Rev. J. W. Blakesley (2 vols. 8vo., 1854), forming vols. iii. and iv. of the 'Bibliotheca Classica'; the text, which is mainly formed on that of Gaisford, being accompanied with an introduction and a large body of notes, embodying the results of the latest investigations, and well calculated to lead the student to a proper appreciation of the character and merits of Herodotus. The Lexicon to Herodotus, by Schweighäuser, is a useful aid to students, though it is far from being complete. Rennell's 'Geography of Herodotus' is a valuable work, which will enable a student to appreciate the merits of the old traveller; and Niebuhr's 'Dissertation on the Geography of Herodotus'; Dahlmann's Essay above referred to; that of Heyse, 'De Vita et Itineribus Herod.', Berlin, 1827; and Kenrick's 'Egypt of Herodotus, with notes and preliminary dissertations,' London, 1841, are worth the student's attention. 'The Apology of Herodotus,' by H. Stephens, prefixed to his corrected edition of Valla's translation (Frankfurt, 1595), is a clever and amusing vindication of Herodotus against the charge of falsehood, made on the ground that many of his stories were so singular and improbable. L'Archer's French translation, 9 vols. 8vo., Paris, with the Commentary, is a useful book; and Creuzer's 'Commentationes Herodotese,' Leipzig, 1819, may be consulted with profit. The German translation by Lange, 2 vols. 8vo., Breslau, 1824, has the merit of fidelity, and to a considerable degree is a successful attempt to convey a notion of the literary character of the original. The English translation by Beloe is in every respect bad; a much better one is that by the Rev. H. Cary, in Bohn's 'Classical Library.'

A life of Homer, which bears the name of Herodotus, is subjoined to most editions of the text, but evidently comes from another hand.

HEROPHILUS, a native of Chalcedon, was one of the most celebrated physicians of the Alexandrian school, and lived in the reign of the first Ptolemy of Egypt. Of his works, which appear to have been very voluminous, nothing now remains except the extracts made from them by Galen and Caelius Aurelianus, in which they are so interwoven with those of his contemporary Erasistratus, that it is

impossible to say what portion of the progress which medicine made in their time was owing to the labours of each.

The chief feature which marks the time of Herophilus in the history of medicine is the commencement of the study of anatomy from dissections of the human body, for which purpose the bodies of all malefactors were appropriated by the government. With such zeal did Herophilus pursue this science, that he is said to have dissected 700 subjects, and it was against him and Erasistratus that the very improbable charge was first made of having frequently opened living criminals that they might discover the secret springs of life. (Celsus, 'Præfat.'). From the peculiar advantages which the school of Alexandria presented by this authorized dissection of the human body, it gained, and for many centuries preserved, the first reputation for medical education, so that Ammiannus Marcellinus, who lived about 350 years after its establishment, says that it was sufficient to secure credit to any physician if he could say that he had studied at Alexandria.

By the labours of Herophilus and Erasistratus nearly every part of the anatomy of the human body was rendered clearer, and many most important discoveries were made. They first determined that the nerves are not connected with the membranes which cover the brain, but with the brain itself, though as yet the distinction of the nerves from the tendons and other white tissues had not been made out. The description which Herophilus gave of the brain itself was far superior to those of previous authors: he discovered the arachnoid membrane, and showed that it lined the ventricles, which he supposed were the seat of the soul; and the chief meeting of the sinuses into which the veins of the brain pour their blood still bears the name of Torcular Herophili. He noticed the lacteals, though he was not aware of their use; he pointed out that the first division of the intestinal canal is never more than the breadth of twelve fingers in length, and from this fact proposed for it the name (duodenum) by which it is still called.

Herophilus practised surgery as well as medicine; but it is probable that very soon after his time the division of surgery and medicine into distinct professions took place. Of his knowledge of medical practice there is not sufficient evidence in the extracts which Galen makes from his works to enable us to form an accurate idea, and his fame must rest rather on the indirect assistance which he afforded by his anatomical researches than on any immediate addition to the means of curing disease. He does not appear to have drawn many pathological conclusions from his knowledge of the healthy structure, but his observations on the pulse, of which his master Praxagoras had taught him some of the value as a means of discriminating diseases, were important and interesting; and it was he who first showed that paralysis is the result not of a vitiated state of the humours, as was previously imagined, but of an affection of the nervous system. Herophilus seems to have founded a school which took its name from him. According to Strabo (xiii. p. 580), there was a great school of Herophilists in his time established in a temple between Laodiceia and Carura in Phrygia.

HERRE'RA, ANTONIO, Coronista Mayor de las Indias y Castilla, born at Cuellar in 1549, died at Madrid on the 19th of March 1625. He is extolled by Robertson ('History of America,' b. v., note 70), and many other distinguished writers. Quintana ('Vida de Pizarro,' appendix vii.) points out some inaccuracies, which however he extenuates as unavoidable in that work, the chief and still the best source of information which Herrera left for subsequent writers on American history from 1492 to 1554. The first and now rare edition of that laborious performance bears the title of 'Historia General de los Hechos de los Castellanos en las Islas y Tierra Firma del Mar Oceano, en 8 décadas,' 4 vols. fol., Madrid, 1601. A second edition, that of Antwerp, 4 vols. fol., 1728, is very incorrect. A highly-improved edition, with corrections and additions, is entitled 'Descripcion de las Indias Occidentales,' 4 vols. fol., Madrid, 1730. Barleus published this history in his 'Novus Orbis,' 1622; and Nicolas Coste, in his 'Histoire Générale des Voyages des Castellans,' 1659; and Captain Stevens, in his 'History of America,' 1725. The rarest perhaps of several other politico-historical works of Herrera is entitled 'Historia de lo Sucedido en Escocia y Inglaterra en 44 años que vivió Maria Estuarda,' 8vo, Madrid, 1689, and 8vo, Lisbon, 1590.

HERRE'RA, FERNANDO, a native of Seville, lived in the 16th century, the golden age of Spanish poetry, among the reformers of which he was prominent. He won the admiration of his contemporaries, who prefixed to his name the epithet of 'divine.' Inspired by Pindar, he became one of the first classical ode-writers in modern Europe: his odes on the battle of Lepanto, and the 'Ode to Sleep,' are worthy of his Greek model. An attempt so congenial to Herrera's aspirations, and to those of his age—that of elevating his native poetry to the level of the Greek and Roman—led Herrera to overstrain the powers of his own language by the adoption of antique modes of expression, which the learned of that age endeavoured to establish as the sole expressions of the beautiful and the sublime. It was chiefly to inculcate these principles, or to foster a corresponding taste, that Herrera commented on Garcilaso—a practical way of developing a theory, which has been followed by a host of commentators.

An edition, now rare, of his poetical works appeared after his death under the title, 'Obras en Verso de Hernando de Herrera,' Sevilla, 4to,

1582. Another equally rare is, 'Versos de Hernando de Herrera, emendados y divididos por él en 3 libros,' 4to, Sevilla, 1619. Of his prose writings those remaining are, 'Relacion de la Guerra de Chipre, y Suceso de la Batalla de Lepanto,' 8vo, Sevilla, 1572; and 'Vida y Muerte de Thomas Moro' (translated from the Latin of Stapleton), 8vo, Sevilla, 1592, and Madrid, 1625.

HERRE'RA, FRANCISCO DE, surnamed EL VIEJO (the Elder), was born at Seville in 1576. He was one of the most eminent of the Spanish painters of the school of Seville. He excelled both in design and colouring, and though his execution was decided and rapid, his works will bear the test of minute investigation. Among his best works are the 'Last Judgment,' in the church of San Barnard; the 'Descent from the Cross and the Effusion of the Holy Ghost,' in the church of San Ines; and, in fresco, the cupola of San Bonaventura—all at Seville. His easel pictures, mostly representing subjects of common life—kitchens, alehouses, inns, &c.—are admirably executed, and fetch high prices. He also worked in bronze, and has left some etchings. In 1647 he completed his works in the episcopal palace at Seville, and went in 1650 to Madrid, where he died, some say, in the same year; others in 1656.

HERRE'RA, FRANCISCO DE, called EL MOZO (the Younger), painter and architect, son of the preceding, inherited his father's talents. The father being a man of a tyrannical disposition, his son left him, and went to Rome to pursue his studies. After his father's death he returned to Seville, and painted for the churches. An academy being established in 1660, he was made sub-director; but being too proud to brook the superior authority of Murillo, he went to Madrid, where he rivalled the most eminent artists. He painted both in oil and fresco. His frescoes in the chapel of San Philip so pleased King Philip IV., that he commissioned him to paint the chapel of the Madonna de Atocha, where he painted the 'Assumption of the Virgin.' This and other works procured him the honour of principal painter to the king, and superintendent of the royal edifices. He died in 1685, aged sixty-three.

HERRERA, GABRIEL ALONSO, a native of Talavera, called the New Columella, lived in the second half of the 15th and the beginning of the next century. He was a professor at the University of Salamanca, and had from an early age a predilection for rural economy. Accordingly he collected the best information that he could derive from the ancients, as well as from his travels at home and abroad, in a treatise which he published under the patronage of Cardinal Cisneros, with the title of 'Obra de Agricultura copilada de Diversos Autores,' fol., Alcalá, 1513 (black letter). None of its twenty-eight subsequent editions presented, according to Juan Iriarte, the original text; but this was restored at last by the Sociedad Económica Matritense, in their 'Agricultura General, corregida y adicionada,' 4 vols. 4to., Madrid, 1818.

HERRICK, ROBERT, was born in the year 1591. Of his life few or no particulars are known, except that he was vicar of a parish called Dean Prior in Devonshire for the space of twenty years, was ejected by Cromwell and restored by Charles II., and long held in remembrance by his parishioners as a poet. His poems are of two very different kinds, sacred and love pieces; the latter often disgraced by indecency, but both exhibiting a richness of fancy mingled with the quaintness of the age in which he lived, such as to render him worthy of one of the highest places in the scale of British lyrical poets. He is however very unequal. His poems were published in 1647-48 under the title of 'Hesperides, or the Works, both Human and Divine, of Robert Herrick, Esq.' The 'Hesperides' have several times been reprinted. The date of his death is not given in the biographies, but it appears from the registers of Dean Prior parish that "Robert Herrick, vicker," was buried on the 15th of October 1674. (See a communication by Mr. Milner Barry to *Notes and Queries*, i. 292.)

HERSCHEL, WILLIAM, was the second son of a musician at Hanover, and was born November 15, 1738. His father brought him up to his own profession, with four other of his sons, giving them at the same time a good education in other respects. At the age of fourteen, he was placed, it is said, in the band of the Hanoverian regiment of guards, which regiment he accompanied to England at a period which is variously stated from 1757 to 1759. Another account states that he came to England alone. After his arrival, he was for some time at Durham, where he is said to have superintended the formation of a band for the militia, and afterwards was for several years organist at Halifax, where he employed himself in teaching music and studying languages. There is a mass of stories relating to his musical occupations, none of which have any certain foundation, as—that he played in the Pump-room band at Bath—that upon the occasion of being a candidate for the situation of organist, he helped his performance by little bits of lead placed upon holding notes, which he dexterously removed in time—that in Italy, to procure money to pay his passage home, he gave a concert, at which he played at once upon a harp and two horns, one fastened to each shoulder—&c. The last story must be incorrect, as he never was in Italy; and, though much given to music, he never (latterly at least) played the French horn, or any other military instrument, but only the violin and organ; from which, as well as the vagueness of the accounts, it may be doubted whether his professional talents were ever employed in a band.

About 1766 he was organist of the Octagon chapel at Bath; in which place he began to turn his attention to astronomy. How well his talents suited that pursuit was afterwards seen, and his preliminary studies had been amply sufficient for the purpose. Though not a mathematician of the first order, his attainments in that science were more than respectable, and his power of applying his knowledge was, like that of Thomas Young, so great as to make it a source of regret that he did not pay special attention to the exact sciences. The earliest writing of Herschel which has come to our knowledge is the answer to the prize question in the 'Ladies' Diary' for 1779, proposed by Peter Puzzlem (a name which the celebrated Landen always adopted in his contributions to that work), namely, 'The length, tension, and weight of a musical string being given, it is required to find how many vibrations it will make in a given time, when a small given weight is fastened to its middle and vibrates with it.'

His astronomical pursuits led him to desire a telescope, and as the purchase of a good reflector was 'fortunately' beyond his ability, he resolved to make one for himself. After many trials he succeeded in making a Newtonian telescope of five feet focal length, and we find him before long not only in possession of adequate means, the work of his own hands, but employing those means with a true perception of the field in which his services were wanted, and a persevering determination to throw light upon our knowledge of the organisation of the universe.

There are two great branches of astronomy; the first consisting of those investigations, theoretical and practical, by which the mighty clockwork of the heavens is made our measure of time, and our means of settling the relative positions of places on the earth, and of guiding a vessel from one port to another; the second consisting of inquiries, theoretical and practical, into those phenomena which guide us to such knowledge as we can obtain of the constitution of the heavenly bodies. The study of the science of optics, the improvement of telescopes, the application of sound reasoning to the collective phenomena pointed out by such instruments, and, subordinate to the last, a knowledge of the past history of observation, are the keys to the advance of this part of the science. Herschel devoted himself sedulously to every part of this task, and the consequence was success such as the world had hardly seen before, and a reputation of twofold splendour, appreciable in its different parts by men of the lowest as well as of the highest order of cultivation.

Herschel began to contribute to the 'Philosophical Transactions' in 1780, and in 1781 announced to the world his discovery of a supposed comet, which soon turned out to be a new planet. We have not here to describe the details of this discovery, the merit of which in itself is small. It is the method which gave rise to it on which this part of Herschel's fame must rest. Perceiving how much depended upon an exact knowledge of telescopic phenomena, and a perfect acquaintance with the effect produced by differences of instrumental construction, he commenced a regular examination of the heavens, taking the stars systematically in series, and using one telescope throughout. If an indifferent person were by accident to pick up a manuscript out of a large number lying in a library, and were to find it on examination to be a lost classic author, he would be entitled to praise, since it is not every one who would know what he had got hold of, even when the writing was in his hands; but if the same person were to make the same discovery while voluntarily engaged in the formation and classification of an immense catalogue requiring knowledge of ancient and modern languages and literature, the credit due to the discovery would be very much increased. This case is analogous with that of Herschel, who was not a mere dilettante stargazer, but a volunteer carrying on with no great pecuniary means a laborious and useful train of investigation.

The announcement of this comet or (as it turned out) planet drew Herschel immediately into the full blaze of fame; and George III. honoured his reign by immediately attaching the new astronomer to his court under the title of private astronomer to the king, with a salary of 400*l.* a year. Herschel fixed his residence first at Datchet, and afterwards at Slough, near Windsor, and his abode became, as Fourier remarks, one of the remarkable spots of the civilised world. His family consisted at first of one of his brothers, and his sister, Miss Caroline Herschel, who was his coadjutor and assistant in his computations and reductions, and also actively employed in observation, having been, among other things, the discoverer of more than one comet. [See notice of CAROLINE HERSCHEL below.]

Herschel married a widow lady, Mrs. Mary Pitt, and left one son, whose name has long been known to the public as one of the most active and successful adherents of science that our day has produced. [HERSCHEL, SIR JOHN.] The deficiency of authentic information leaves us little more to say on the private life of Herschel. He was knighted, and received the degree of Doctor of Laws from the University of Oxford. He was soon in affluent circumstances, partly by the profits arising from the sale of his mirrors for reflecting telescopes, and partly by the jointure of his wife, which was considerable, and he died wealthy. His death took place on the 23rd of August 1822.

Herschel's papers in the 'Philosophical Transactions' exhibit the unwearied activity of their author. They are sixty-nine in number, and range from the 70th volume, in 1780, to the 105th volume, in 1815. He also wrote a paper entitled 'On the Places of 145 New Double

Stars,' published in the first volume of the 'Memoirs of the Astronomical Society' in 1822.

Herschel must be remembered by the number of bodies which he added to the Solar System, making that number half as large again as he found it. Including Halley's comet, and the four satellites of Jupiter and five of Saturn, the number previously known was eighteen, to which he added nine, namely, Uranus and six satellites, and two satellites to Saturn. His discovery of the rotation of Saturn's ring, his measurements of the rotation of Saturn and Venus, his observations of the belts of the former, and his conjectural theory, derived from observation, of the rotation of Jupiter's satellites, with a large number of minor observations, prove that no one individual ever added so much to the facts on which our knowledge of the solar system is grounded. To this we must add, that his announcement (in 1803) of the motions of binary stars round each other was accompanied by the first proof that there exist in the universe organised systems besides our own; while his magnificent speculations on the Milky Way, the constitution of nebulae, &c. &c., first opened the road to the conception that what was called the universe might be, and in all probability is, but a detached and minute portion of that interminable series of similar formations which ought to bear the name. Imagination roves with ease upon such subjects; but even that daring faculty would have rejected the ideas which, after Herschel's observations, became sober philosophy.

The instrument by which this great work was achieved was the reflecting telescope, the second reflecting surface which is found in the constructions of Newton, Gregory, and Cassegrain having been rejected, and the eye-piece applied directly to the image produced from the large mirror, which is the distinguishing feature of the Herschelian telescope. Herschel had constructed more than one such instrument of 20 feet focal length before he attempted the enormous one of 40 feet, which he erected in the grounds of his house at Slough. This instrument was begun in 1785, and Herschel dates the completion from August 28, 1789, on which day he discovered with it the sixth satellite of Saturn.

The catalogues of double stars, nebulae, &c., and of the comparative brightness of stars, would alone constitute a title to the name of a distinguished astronomer; and the optical researches, with those on the refrangibility of heat, are highly valuable; while the papers on the power of telescopes should be read by all who wish to understand those instruments.

HERSCHEL, CAROLINE LUCRETIA, the sister of the great astronomer Sir William Herschel, was born at Hanover on the 16th of March 1750. Till her twenty-second year she lived with her parents in her native place; after which she came over to England to reside with her brother, then established as an organist at Bath. When Sir William exchanged his profession as a musician for those astronomical labours which were to immortalise his name, his sister became his constant and most valuable helpmate. "From the first commencement of his astronomical pursuits," says an authority who writes from intimate knowledge, "her attendance on both his daily labours and nightly watches was put in requisition, and was found so useful that, on his removal to Datchet and subsequently to Slough, she performed the whole of the arduous and important duties of his astronomical assistant—not only reading the clocks and noting down all the observations from dictation, as an amanuensis, but subsequently executing the whole of the extensive and laborious numerical calculations necessary to render them available for the purposes of science, as well as a multitude of others relative to the various objects of theoretical and experimental inquiry in which, during his long and active career, he was at any time engaged." For these important services she was in receipt of a moderate salary allowed her by George III. But, in addition to these labours performed expressly as her brother's assistant and amanuensis, she found time to perform others of a similar character on her own account. Though sitting up frequently all night till day-break, more especially in winter, while her brother required her help, she was able, by snatching such intervals of time as her brother's occasional absences permitted, to conduct a series of observations of her own with a small Newtonian telescope, which he had constructed for her. Her special employment with this instrument was to sweep the heavens for comets; and so successful was she in this employment that she discovered seven comets, of at least five of which she was entitled to claim a clear priority of discovery. The dates of the discoveries of the seven comets were as follows:—August 1, 1786; December 21, 1788; January 9, 1790; December 15, 1791; October 7, 1793; November 7, 1795; August 6, 1797. Besides the discovery of these comets, she had the merit of having made original observations of several remarkable nebulae and clusters of stars, included in her brother's catalogues. In 1798 she published, with an introduction by her brother, an astronomical work of great value, entitled 'Catalogue of Stars taken from Mr. Flamsteed's Observations, contained in the second volume of the *Historia Coelestis*, and not inserted in the British Catalogue, with an Index to point out every observation in that volume belonging to the stars of the British Catalogue: to which is added a collection of Errata that should be noticed in the same volume.' In this work, which was published at the expense of the Royal Society, no fewer than 561 stars observed by Flamsteed, but which had escaped the notice of the framers of the 'British Catalogue,' were pointed out. During the whole of her brother's career Miss

Herschel remained by his side, aiding him and modestly sharing the reflection of his fame. After his death, in 1822, she returned to her native Hanover to spend the remainder of her days. They were unusually protracted; for, though she was seventy-two years of age when she left England, she lived for twenty-six years longer. Even these venerable years were not spent idly. In 1828 she completed a catalogue of the nebulae and clusters of stars observed by her brother, for which labour the Astronomical Society of London voted her their gold medal. She was also chosen an honorary member of that society—an honour very unusual in such a case. Living in dignity and tranquillity, retaining her memory and the full use of her faculties almost to the last, and receiving from time to time marks of the highest respect from the king and crown-prince of Hanover and from other German sovereigns, she survived till the 9th of January 1848, when she died in her ninety-eighth year. Among the female examples of the pursuit of knowledge, very few names deserve so high a place as that of Caroline Herschel.

*HERSCHEL, SIR JOHN FREDERICK WILLIAM, BART., the only son of Sir William Herschel, and the worthy inheritor of his illustrious name, was born at Slough near Windsor in the year 1790. Educated at Cambridge, at St. John's College, he distinguished himself there from the first by his high mathematical genius, and a fondness for physical science in all its branches, which proved to his friends that the world might expect in him a true Herschel the second. In 1813 he graduated B.A.; and was Senior Wrangler and Smith's prizeman. From this time till the death of his father in 1822, he was occupied chiefly in mathematical studies and researches in theoretical physics. His first work of note was 'A Collection of Examples of the Application of the Calculus to Finite Differences,' published at Cambridge in 1820. It was not till after his father's death that he devoted himself in an express manner to the continuation of that immense work of astronomical research and investigation, which his father had begun and carried on through a life of such magnificent results. Abandoning other pursuits or making them for the time subordinate, he commenced, about the year 1825, a series of observations of the sidereal heavens after his father's method and with his father's instruments. In this labour, in which for a time he co-operated with Sir James South, he proposed to himself at first, to use his own words, "no further object than a re-examination of the nebulae and clusters of stars discovered by his father in his 'sweeps of the heavens,' and described by him in three catalogues presented to the Royal Society, and published in their 'Transactions' for the years 1786, 1789, and 1802." The execution of the undertaking occupied eight full years, and involved results much more extensive than had been at first contemplated. As regards nebulae and clusters of stars, the results were exhibited complete in the year 1833, when they were presented to the Royal Society in the form of a 'Catalogue' arranged in the order of Right Ascension, which was published in their 'Transactions' for the same year. "In this work," says Sir John, "are recorded observations of 2306 nebulae and clusters; of which 1781 are identical with objects occurring in my father's catalogue, in the small but interesting collection published by Messier in the 'Mémoires de l'Académie des Sciences' for 1771, and the 'Connaissances des Temps' for 1783, 1784, and in M. Struve's 'Catalogue of Double Stars': the remaining 525 are new." But these were not the only results of the eight years' survey. A great number of double stars of all classes and orders had also been noticed and observed, and their places taken, "to the amount altogether," says Sir John, "of between 3000 and 4000;" the observations of which, reduced and arranged in the order of their right ascension, had from time to time, in the course of the survey, been published in six catalogues in the 'Transactions of the Royal Astronomical Society,'—the first in 1825, the others in subsequent years. Results so important, obtained by labour so systematic, fixed Herschel's place as the man who, among living astronomers, was pre-eminently the successor of his father. As early as 1826 this was recognised, when the Royal Astronomical Society voted to him and Sir James South a gold medal each for their observations of double stars; but at the close of the survey in 1833, the associations with his name were correspondingly increased. In addition to the labours of the survey, he had by that time given to the world proofs of his industry and versatility, which even alone would have counted for much—to wit, various scattered memoirs published in the 'Transactions of the Astronomical Society'; a 'Treatise on Sound,' published in 1830 in the 'Encyclopædia Metropolitana'; a 'Treatise on the Theory of Light,' published in the same work in 1831; and his more celebrated and popular 'Preliminary Discourse on the Study of Natural Philosophy,' published in Lardner's 'Cyclopædia' in the same year. This last-mentioned work, admitting as it did from the nature of its subject more of general philosophic thought than the author's special treatises on individual topics of physical science, gave the author a place in the higher didactic literature as well as in the science of his country; and to this day it is a standard work in the library of every general student, as well as in strictly scientific libraries. In 1836 there appeared in the same 'Cyclopædia,' a 'Treatise of Astronomy,' also by Herschel, and proving his power as a popular expositor on the peculiar science of his family. Before the publication of this work however he had undertaken and commenced a second great design in practical astronomy, in continuation and

completion of that which he had concluded in 1833. The southern heavens still remained to be surveyed as well as the northern; and Herschel resolved, if possible, to add this till then comparatively unknown hemisphere to the domain of astronomy, so as to complete for mankind the survey of the whole sphere of the sidereal space. His own account of his intention and hopes is strikingly simple. "Having," he says, "so far succeeded to my wishes, and having by practice acquired sufficient mastery of the instrument employed (a reflecting telescope of 18½ inches clear aperture and 20 feet focus, on my father's construction), and of the delicate process of polishing the specula; being moreover strongly invited by the peculiar interest of the subject and the wonderful nature of the objects which presented themselves in the course of its prosecution, I resolved to attempt the completion of a survey of the whole surface of the heavens, and for this purpose, to transport into the other hemisphere the same instrument which had been employed in this, so as to give a unity to the results of both portions of the survey, and to render them comparable with each other." In execution of this great design, he set out, with the telescope mentioned and other necessary apparatus, for the Cape of Good Hope, as affording the most suitable station for his purpose. He reached the Cape on the 15th of January 1834, and, after some search, selected the mansion of a Dutch proprietor at Feldhausen, about six miles from Table-Bay, and situated in a beautiful and well-shaded spot. Here he set up his instruments, not one of which had suffered injury on the voyage; and on the 5th of March he was able to begin a regular course of sweepings of the southern heaven. His observations were continued, without any intermission, save that occasioned by the weather, over four years, or from March 1834 to May 1838; and all at his own expense. Immense interest was felt by the scientific world of Europe and America in the progress of his solitary and sublime labours. From time to time curiosity was gratified by accounts of some of the observations conveyed over to friends; but it was not till the year 1847, or nine years after his return to England that the collected and digested results of his four years' residence at the Cape were published in a regular form. This was done in a large quarto volume published that year under the title of 'Results of Astronomical Observations made during 1834-38 at the Cape of Good Hope; being the Completion of a Telescopic Survey of the Whole Surface of the Visible Heavens, commenced in 1825.' The nature and extent of the observations and disquisitions in this work may be judged from a list of its contents. It is divided into seven distinct portions—the first treating of 'The Nebulae of the Southern Hemisphere'; the second of 'The Double Stars of the Southern Hemisphere'; the third of 'Astronomy, or the numerical expression of the apparent Magnitudes of Stars'; the fourth of 'The Distribution of Stars, and the Constitution of the Galaxy in the Southern Hemisphere'; the fifth of 'Observations of Halley's Comet (as seen at the Cape towards the close of 1835), with remarks on its physical condition and that of Comets in general'; the sixth of 'Observations of the Satellites of Saturn'; and the seventh of 'Observations of the Solar spots.' It will be seen from this list of contents that though the astronomer's main object in the southern hemisphere, as in the northern, had been the detection of new and the re-examination of old nebulae, yet his observations had extended themselves so as to include all the objects for which his position was favourable. In fact, not only was a mass of new observations appertaining to the southern heavens, and exhausting these heavens of what they could be made to yield, added to astronomical science by the survey; but many of the extreme speculations of the elder Herschel and others relative to the highest problems of astronomy were reviewed afresh in the light of the new observations. Accordingly, the substance both of the observations and the speculations has since been incorporated in all the more recent works of general astronomy.

It is worthy of remark, that Herschel's residence at the Cape was beneficial not only to astronomy but also to meteorology. While there he suggested a plan of simultaneous meteorological observations to be made at different places—a plan subsequently developed in a publication of his, issued under official military authority in 1844, and entitled 'Instructions for Making and Registering Meteorological Observations at various stations in Southern Africa.' On the return of the astronomer to England, in 1838, it is needless to say that he was received with every public honour. During his absence the Royal Astronomical Society had again voted him their gold medal (1836); on the occasion of the coronation of Queen Victoria he was created a baronet; in 1839 he was made a D.C.L. of Oxford; and there was a proposal to elect him to succeed the Duke of Sussex as president of the Royal Society. In 1848 he was president of the Royal Astronomical Society. Having by that time completed the digest and publication of his observations at the Cape (during the preparation of which however he had published various incidental papers in the 'Transactions of the Astronomical Society') he was free to pass on to other labours. Of these the most important of a literary kind has been his work entitled 'Outlines of Astronomy' (enlarged from his former treatise in 'Lardner's Cyclopædia'), published in 1849. In the same year he edited a collection of papers by various authors, published by authority, and entitled 'A Manual of Scientific Enquiry; prepared for the use of her Majesty's Navy, and adapted for Travellers in general.' In December 1850, when the office of

Master of the Mint was converted from a ministerial into a permanent one, it was conferred upon Sir John Herschel; and this office was retained by him till 1855, when he resigned it on account of ill health, and Professor Graham, the eminent chemist, was appointed his successor.* The interest which Sir John Herschel takes in the popular diffusion of scientific knowledge, as well as in education in general, has been exhibited not only in his popular treatises, but also in occasional lectures and addresses to other audiences than those accustomed to meet him as a colleague in learned societies. An address of this kind, delivered to the subscribers to the Windsor and Eton Public Library, was published in a periodical work ('The Printing-Machine') issued by Mr. Knight in 1834.

*HERTZ, HENRIK, an eminent Danish dramatic poet, was born at Copenhagen on the 25th of August 1798 of a respectable Jewish family. In 1817 he entered the University of Copenhagen as a student of law, and for the next seven years, at the end of which he took his degrees with honour, his attention was divided between law, which he detested, and poetry and Persian literature, to which his inclination led him. In the year 1830 appeared a poetical satire on the taste of the age in Denmark, which produced a sensation akin to that excited by the 'English Bards and Scotch Reviewers' among ourselves. It was entitled 'Gjengangerbreve,' or 'Letters of a Ghost,' and was in the form of poetical epistles from Paradise, in some passages of which there was a skilful imitation of the style of Baggesen, then recently deceased, who had been the great opponent of Oehlenschläger, the head of the Danish Parnassus. The satire was however directed not against Oehlenschläger himself, but against some of his servile imitators, and Hans Christian Andersen. The book was strictly anonymous: curiosity was on the alert to discover the author, who was styled the 'Danish Great Unknown;' but the secret proved impenetrable for two years, when the 'Letters' were acknowledged by Henrik Hertz. He confessed at the same time to the authorship of several plays which had been acted with success since 1827, and his connection with which had been so carefully concealed that he had sent them to the management under three different signatures. One of them, 'Amors Ganiestreg' ('Cupid's Master-Strokes'), was the first Danish comedy in which the dialogue was versified as in the French classical drama, and the novelty was completely successful. In 1832, the same year in which he made his name public, he left the Jewish community, and became a Protestant. In the next year he was admitted to the travelling pension, with which the Danish government is in the habit of encouraging young men of letters, and took a tour to Germany, Italy, and France. Since his return to Copenhagen in 1834 he has been an active writer in more than one department, and a collection of his dramatic works alone, 'Dramatiske Værker,' which was commenced in 1855, has already extended to ten volumes. They are of all kinds, from 'Svend Dyrings House,' a tragedy in four acts, in which he has powerfully rendered the old northern spirit, to 'Perspektivkassen' ('The Penny Show'), an interlude in one act, in which the English reader is entertained to find the exhibition, described in humorous doggerel, of the English court, with its conspicuous characters, Queen Victoria and 'Lord' Peel. Perhaps the most successful of all is the charming little drama, 'Kong Renes Datter,' or 'King Ren's Daughter,' which has been rendered into many languages, and among others into English by Theodore Martin. It was acted with success at the Strand Theatre in 1850, and is perhaps the only Danish drama of which a direct translation has ever appeared on the English stage. Hertz is also a lyric poet of high reputation, but is considered to have failed as a novelist in a 'tendency-novel' which was directed against the Danish liberals. He is an intimate friend and literary ally of Heiberg. [HEIBERG, J. L.]

*HERTZEN, ALEXANDER, a remarkable and very able Russian author, who has now been for some years resident in England. A vivid light is thrown upon much of his career by his own Memoirs, considerable portions of which have been published in this country. He was born at Moscow in 1812, and his nurse used to relate to him his adventures as an infant in arms when the French entered the city, his father, a Russian officer of rank, having delayed to leave till he was surprised by the appearance of the enemy. The family was allowed to depart after an interview of his father with Napoleon, who intrusted him with a letter to the Emperor Alexander, which he promised to deliver in person. This interview is described at length in Baron Fain's Memoirs and the Russian history of the war, by Mikhailovsky Danilevsky. Young Herten grew up at Moscow, almost without a companion, surrounded by teachers and servants, his father having grown misanthropic and caustic in a dull retirement in Russia, after having spent much of his life in foreign countries, and concluded his career by inducing his wife, a German girl of seventeen, to elope with him in men's clothes from Cassel. The solemn entry of the Emperor Nicholas into Moscow before his coronation in 1826, was marked by an imperial order, strange, indeed, on the eve of such a ceremony, for the execution of five of the conspirators who in the preceding December had endeavoured to subvert the existing government at St. Petersburg, and a service of thanksgiving took place on the occasion. "A boy of

fourteen, and lost in the crowd," says Herten, "I was present at that service, and there before the altar polluted by that sanguinary prayer, I swore to avenge the executed dead. I devoted myself to the struggle against that altar, against that throne, and against those cannon. I have not obtained my revenge: the guard, and the throne, the altar and the cannon, are all remaining, but for thirty years I have stood under that banner which I have not once abandoned." It must, however, be observed, that in his Memoirs, in relating this portion of his life, he tells us at that period he supposed that the conspirators had perished in an ineffectual struggle to defend the hereditary rights of the Grand Duke Constantine to the throne [CONSTANTINE, PAVLOVICH], and that for some time after, Constantine was his favourite hero. On becoming a student at the University of Moscow, his ideas grew more enlarged, and of course more enlightened, but he was soon at discord with those whom he calls in contempt the liberals of 1825, of whom Polevoy, the eminent Russian author, was one. "I told him one day," he relates, "that he was just such a superannuated conservative as those against whom he had been all his life contending. Polevoy was deeply offended at my words, and shaking his head, said to me, 'The time will come, when in return for a whole life of exertions and labour some youngster will say to you with a smile of superiority, Take yourself away, you are a superannuated man.'" The circumstance that drew upon Polevoy the reproach of obstinacy, was that he did not embrace with Herten the ideas of St. Simonism, which was at that time the favourite doctrine of the ultra-liberal of the Moscow students. Herten had left the university with a high degree, when in 1834 he was involved in an affair which had serious consequences. Several of the students were arrested for having sung at a merry meeting a seditious and blasphemous song, and though he had not been present, he was at the conclusion of a long investigation, during which he suffered a severe imprisonment, condemned to one of the lightest punishments,—that of being employed in the service of the state under surveillance of the local officials. He was in pursuance of this sentence sent to Viatka, where he remained till 1837, when the Hereditary Grand Duke, now the Emperor Alexander the Second, coming on a tour of inspection with Zhukovsky, the celebrated poet, for his companion, their attention was favourably attracted by the talents and accomplishments of the banished man, and he was in consequence permitted to remove nearer home to Vladimir, where he married a lady to whom he had been some time attached, and lived in the enjoyment of great domestic happiness.

He was afterwards summoned to some official duties in an office at St. Petersburg, under Count Strogonov, but there he was soon told that "his imperial majesty had become acquainted with his taking part in the propagation of reports injurious to the government," and by the favour of Count Strogonov, who resented the interference of the police with a person under his authority, named a member of council at Novgorod. "This was indeed ludicrous," he observes. "How many secretaries and assessors, how many district and government officials had sought and sued for, long, passionately and obstinately sought and sued for, this very post; what bribes had been given, what promises obtained, and all of a sudden the minister, ostensibly carrying out the imperial will, and at the same time giving a filip to the secret police, handed me this promotion, merely to gild a pill, threw this place, the object of warm desires, at the feet of a man who only took it with the fixed intention of casting it away at the first opportunity." The death of his father in 1846 put Herten in possession of a considerable property, but his first application was to be allowed to travel, and in 1847 he had the satisfaction of leaving the Russian frontier behind him. He was in Italy, where he declares that he first met persons who truly sympathised with his ideas, when the news of the French Revolution of February 1848 reached him, and he hastened to Paris. Here he was in his element amidst the most vehement of the Socialists, till the defeat of that party in June plunged him in despair. He soon found it expedient to take refuge in Geneva, and not long after in England, where he has remained ever since; though, as might be expected from his principles as a Socialist Republican, utterly averse to the manners of the country, and to most of its institutions, except those which protect foreigners and guarantee to them the exercise of privileges which they are denied elsewhere. His chief business in England has been to establish a 'Russian Free Press,' a printing-office in which those productions can see the light which are strictly suppressed in the country that gave them birth. It is the first, perhaps, that has ever existed for the language of a nation of sixty millions which has become more interesting and important every day of the last half-century.

Herten tells us that the French legitimist, the Duke de Noailles, whom he met on board of a steam-boat, told him, after a conversation on politics, "You Russians are either thorough slaves of the Tsar, or else—excuse me the word—you are anarchists." There is too much foundation for the reproach on both points.

The writings of Herten are, however, of considerable value even to those who dissent entirely from his principles. The perusal of his Memoirs is the best and shortest method of becoming acquainted with the outer and inner life of modern Russia, which are sketched with vigour and ability, and of course more unreservedly than in any productions which have to pass the usual ordeal of the imperial censorship. It is the fault of the subject that the delineations are apt to be

* From an accidental delay a notice of Professor Graham, which ought to have appeared in alphabetical order in 'The English Cyclopædia,' was omitted. It will be given at the close of the last volume, with some other additional notices.

somewhat monotonous. Two volumes of these Memoirs were published in English in 1855, under the title of 'My Exile,' and met with considerable success, though they are disfigured by foreign phraseology, and are in need of a perpetual commentary of explanations. The foreign names are printed with singular carelessness—we find 'Tukowsky' and 'Plankin' for the poets Zhukovsky and Pushkin, the 'Prior of Hohenlohe' for Prince Hohenlohe, &c. and there are so many faults of idiom, that stories which in the Russian are told with perspicuity, are in English turned into riddles. The originals of these volumes appeared partly under the title of 'Tyurma i Seuilka' ('Prison and Exile'), and partly as articles in the 'Polyarnaya Zvezda' ('The Polar Star'), a Russian periodical established in London for the purpose of giving to the world the suppressed poems of Pushkin, Lermontov, and others, and of conveying to the Russian public the lucubrations of Louis Blanc, Mazzini, Lelewel, and other friends of Hertzén, as well as Hertzén's own. Two numbers of this magazine have now (September, 1856) appeared, and in this month a new periodical has been commenced under the same editorship with the title of 'Golosa iz Rossii' ('Voices from Russia.') Among other productions of the 'Free Press,' are 'Preravnanié Razskazui' ('Interrupted Tales'), consisting of sketches of Russian life inserted by Hertzén in Russian periodicals at the time of his residence in the country, and to which the passages suppressed by the censorship are now restored. They were published under the name of 'Iakander,' the Oriental form of 'Alexander,' it being forbidden that a person under the surveillance of the police should publish under his own name. A Russian political pamphlet entitled 'Property Baptised,' a German one entitled 'Vom Andern Ufer,' ('From the Other Shore'), and a French one on the 'Development of Revolutionary Ideas in Russia,' are the principal remaining works of Hertzén. These pamphlets are all written with great ability. A series of 'Letters from France and Italy,' 1847-52, may be considered as belonging to the Memoirs.

HERVEY, JAMES, born in 1714, was educated at Lincoln College, Oxford, where he became acquainted with the first Methodists, whose views and society, though he did not enter into their connexion, influenced his course through life. He took orders in the Established Church, devoted his whole life to acts of piety and beneficence, and the sedulous discharge of his clerical duties, and died early, of a decline brought on by labouring beyond his strength, in 1758. For some years preceding he had been rector of Weston-Favell in Northamptonshire. His works are numerous, and all religious; his style is metaphorical, flowery, diffuse, abounding in turgid declamation and strained fancies. Faulty as it is, it enjoyed its season of extensive popularity, and probably has won the notice of many who would have been less attracted by a purer writer. In doctrine he leaned towards the Calvinistic school. The most popular of his works were, 'Meditations and Contemplations,' 2 vols. 8vo, 1746-47; and 'Theron and Aspasia, or a series of Dialogues and Letters on the most important Subjects,' 1753, both of which have passed through numerous editions, and are still often reprinted. A collection of his letters, with a memoir of Hervey prefixed, was published in 2 vols. 8vo, 1760.

* HERVEY, THOMAS KIBBLE, author, the son of a merchant of Manchester, where he was born in 1804. After the usual training at schools, he proceeded to the University of Cambridge, and subsequently to that of Oxford, but left both without taking a degree. Being intended for the bar, he was placed in the office of a special pleader; but legal studies were abandoned for literature. Mr. Hervey's earliest production was 'Australia and other Poems,' in 1824, an effort elaborated from the sketch of a prize poem. He next edited the 'Friendship's Offering' for 1826, contributing many short pieces rich in feeling and variety of expression. 'The Poetical Sketch-Book,' in 1829, contained, with new poems, a collection of his former productions. In 1830 he is supposed to have published a satire called 'The Devil's Visit,' which arose amongst the many imitations of Southey's 'Devil's Walk.' He pursued his more legitimate line in 1832, in vol. i. of 'Illustrations of Modern Sculpture,' a work which was never completed. The 'Book of Christmas,' a careful and interesting series of descriptions and illustrations of Christmas, ancient and modern, appeared in 1836; and a collection of modern poetry, to which Mr. Hervey largely contributed, was edited by him in 1841, under the title of 'England's Helicon in the Nineteenth Century.' This volume contains a poem by Mr. Ruskin, which is probably his earliest production. Throughout all these years Mr. Hervey had contributed to various periodicals, and his reputation as a man of letters procured him in 1846 the editorship of the 'Athenæum' weekly literary journal, which he held until 1854. Mr. Hervey married, in 1843, Eleonora Louisa, daughter of George Conway Montague, Esq., member of a collateral branch of the family of the Duke of Manchester.

* ELEONORA LOUISA HERVEY (Mrs. T. K.), wife of the foregoing, was born at Liverpool, in 1811, and commenced writing at an early age, contributing to the numerous Annuals and Keepsakes between 1825 and 1840. The earliest volume, published in 1833, was entitled 'The Bard of the Sea-Kings,' with other poems; and a silence of some years was broken in 1839 by 'The Landgrave,' a dramatic poem rather than play, in five acts. Mrs. Hervey has also written 'The Poetical Zodiac and Language of Flowers,' of which a new edition was published in 1855, with illustrations by Mr. Doyle. Her subse-

quent works are tales, called 'Margaret Russell,' 'The Double Claim,' and 'The Pathway of the Fawn,' all of which have met with much approbation from their inculcation of domestic morals. Mrs. Hervey's genius attracted at a very early period the attention of Mr. Leigh Hunt, literally, to her name, which he has rendered additionally celebrated in an amusing couplet of his 'Blue-Stocking Revels, or Feast of the Violets':—

"Then Montague, Eleonora Louisa,
Was name ever finer 'twixt Naples and Pisa!"

HESIOD (in Greek, Ἡσίοδος) was a native of Ascra, a village at the foot of Helicon, whither his father had migrated from Cuma in Æolia. Thence he went to Orchomenos, according to his editor Götting, who thinks that by the line, "Ascra, foul in the cold, oppressive in heat, bad at all times," he expresses resentment at the iniquitous conduct of the Ælian judges with respect to the division of his patrimony. Thirlwall doubts the truth of the interpretation, although Götting quotes a passage of Pateroulus (l. 7), which might by possibility refer to it. These facts are collected from the 'Works and Days,' a poem which there is no reason not to ascribe partially, although only partially, to Hesiod. Plutarch tells us that he met his death in consequence of the suspicions of some young men regarding their sister's honour, and we learn from Pausanias that he was revered in later times as a hero.

The only works that remain under the name of Hesiod are, 'The Theogony,' 'The Shield of Hercules,' and the 'Works and Days.'

The Boeotians themselves are said to have considered the last as Hesiod's, although they doubted the authenticity of the other works ascribed to him; but the ingenuity of modern times professes to discover interpolations even in this poem, which consists of advice given by Hesiod to his brother Perses, on subjects relating for the most part to agriculture and the general conduct of life. Whatever may be the decision which is arrived at regarding the authorship, we think one thing must be very evident to all who read the poem, that in its present state it shows want of purpose and of unity too great to be accounted for otherwise than on the supposition of its fragmentary nature. Ulrici considers the moral and the agricultural instruction as genuine, the story of Prometheus and that of the Five Ages as much altered from their original Hesiodic form, and the description of Winter as latest of all.

The 'Theogony' is perhaps the work which, whether genuine or not, most emphatically expresses the feeling which is supposed to have given rise to the Hieratic school, or that school of epic poetry which is connected with the religious life of the Greeks in the same way as Homer and the heroic poets were with the political. It consists, as its name expresses, of an account of the origin of the world, including the birth of the gods, and making use of numerous personifications. This has given rise to a theory that the old histories of creation, from which Hesiod drew without understanding them, were in fact philosophical and not mythological speculations; so that the names which in after-times were applied to persons, had originally belonged only to qualities, attributes, &c.; and that their inventor had carefully excluded all personal agency from his system. This much we may safely assert respecting the 'Theogony,' that it points out one important feature in the Greek character, and one which, when that character arrived at maturity, produced results of which the 'Theogony' is at best but a feeble promise; we mean that speculative tendency which lies at the root of Greek philosophy.

The 'Shield of Hercules' is a fragment, or rather a cluster of fragments; some of them by very late Rhapsodists who copied, according to Aristophanes the grammarian, from Homer's description of the shield of Achilles.

Those who are desirous to pursue the subject of the 'Theogony,' will do well to consult Ulrici, 'Geschichte der Hellen. Dichtkunst,' i. 360, 199; Hermann and Creuzer's 'Briefe über Homer und Hesiod'; Creuzer, 'Symbolik'; and especially Thirlwall's 'History of Greece,' and Müller's 'Prolegomena.'

The best modern editions of Hesiod are Götting's (in 1 vol. 8vo, published in the 'Bibliotheca Græca'), second edition, with notes, 1843; and Dindorf's, Leipzig, 1825, 8vo; the Scholia on Hesiod are printed in the third volume of Gaisford's 'Poeta Græci Minora.'

HESSE, WILLIAM, LANDGRAVE OF, was born at Cassel about the middle of the 16th century, and died in the year 1597. He immortalised his name by the encouragement which he gave to all kinds of philosophical research, and more particularly by the zeal with which he endeavoured to advance the science of astronomy. With the assistance of Christopher Rothmann and Juste Byrge, he erected an observatory, and furnished it with the best instruments that were then obtainable. His observations, which are said to have been of a very curious nature (Hutton's 'Dictionary'), were published at Leyden twenty-one years after his death, by Willebrod Snell, and are spoken of by Tycho Brahé, both in his 'Epistles' and in the second volume of 'Progymnasmata.' (Martin, *Biographia Philosophica*, London, 1764, p. 248.)

HESYCHIUS. There is a valuable Greek Lexicon extant, bearing the name of this author, of whom however nothing except the name is certainly known; he is supposed to have lived in the 5th or 6th century after the Christian era. That which has come down to us is

said to be only an epitome of the original, but of this assertion no proof can be made. It has the appearance of rough notes put down in the course of reading, rather than of a finished work, and consists chiefly of short explanations of unusual Greek words, or forms of words, and technical terms. It was not known until the 16th century. But one manuscript, in the library of St. Mark at Venice, is said to be preserved, and that is full of abbreviations, and has many erasures; which accounts for the great corruption of the text, in spite of the labours of many able editors. The first edition was that of Aldus, 1513, folio; the most complete that of Alberti, 1746, 2 vols. folio, of which the second volume was published by Ruhnken in 1766. This edition has a copious body of Prolegomena, containing all that can be said concerning this author.

HESYCHIUS, named the Illustrious, of Miletus, lived in the 6th century, and wrote a universal history in six parts, from Belus down to his own age. Some extracts of it have been preserved; which, with an abridgment of the 'Lives of the Philosophers,' chiefly from Diogenes Laertius, are edited in one volume by Meursius, 1613; he also wrote the reign of Justinus. (Photius, *Bibl.*, 69.)

HESYCHIUS was a common name under the Greek empire; we find many ecclesiastics and martyrs so called. For a list of those concerning whom something is known, see Fabricius, 'Bibl. Gr.' lib. v. c. 5, and the Prolegomena to Alberti's edition of the Lexicon.

HEVELIUS, JOANNES, or more properly JOANNES HEVEL, a Polish astronomer of great eminence, was born at Danzig, of a noble family, January 28, 1611. After visiting the principal countries of Europe (1630-34), he returned to his native city, and was occupied in business or public affairs till 1639, when, by the advice of Cruger, whose pupil he had been, he applied himself almost exclusively to the study of astronomy. In 1641 he built an observatory in his own house, and furnished it with a quadrant and sextant of three and four feet diameter, together with large telescopes constructed by himself. His scientific pursuits did not however preclude his being elected consul in 1651, to which distinction his rank in society and philosophic character entitled him, and of which he continued to discharge the duties to the time of his death. In 1647 he published a description of the moon, under the name of 'Selenographia' (Gedani, folio), to which was added a representation of the other planets as seen by the telescope. In 1654 appeared his treatise 'De Motu Lunæ Libratorio' (Gedani, folio), in the form of a letter to Riccioli, wherein he gave an explanation of the libration of the moon. (Montucla, 'Hist. des Mathém.' tome ii. p. 638.) To these succeeded an account of the eclipses of 1654: a treatise, 'De Natura Saturni Faciei ejusque Phasibus' (1656); 'Observations on the Transit of Mercury' in 1661, to which he added an account of the transit of Venus in 1639, as observed by Horrox (Gedani, 1661); 'Observations of the Comets of 1664 and 1665,' published in 1665 and 1666; and in 1668 appeared his 'Cometographia.' In 1672 appeared an epistle to Oldenburg on the comet of that year; and in 1673 the first part of the 'Machina Cœlestis' was published. It was this last work which gave rise to public controversy between Hevelius and Dr. Hooke, who published 'Animad. in Mach. Cœlest. Hevelii,' Lond., 1674, in 4to. Hevelius always imagined that better observations could be made with plain sights than with telescopes. Hooke recommended the use of the latter to Hevelius on the receipt of a copy of his 'Cometographia,' and some correspondence took place, which was increased into a quarrel by the dictatorial manner of Hooke in the work just cited. Halley was requested by the Royal Society of London to visit Hevelius at Danzig, and judge of the goodness of his observations. This voyage, which was made in 1679, produced a report from Halley highly favourable to Hevelius. In 1664 Hevelius was elected a member of the Royal Society of London. In 1679 he sustained considerable loss by the destruction of his house and observatory by fire. The whole of his instruments and library were destroyed, including most of the copies of the second part of his 'Machina Cœlestis,' which had only been published that year. This second part is now extremely rare. This accident appears only to have had the effect of increasing his ardour in the pursuit of astronomy, for he shortly after erected a new observatory, though on a less magnificent scale; and by 1685 he had another volume of observations ready for publication. He had now been occupied forty-nine years as an observer, and had attained sixty-three years, the climacteric, as it is used to be called, of life, for which reason this volume (the last published during his lifetime) is entitled 'Annus Climactericus.' His posthumous works are 'Firmamentum Sobieskianum' (1690) and 'Prodromus Astronomiæ' (1691). He died at Danzig, universally respected, in 1687-88, and in his seventy-sixth year. During his lifetime he carried on an active correspondence with most of the learned men of Europe. The letters of his correspondents, and numerous observations, in 17 folio volumes, were purchased of his family by M. Delille in 1725, and some of these were published by J. P. Kobilus in the supplement to the ninth volume of the 'Acta Eruditorum,' sect. viii. p. 359: the rest are at the Royal Observatory at Paris. His relation, J. E. Olhoff, published a considerable number of letters written to him in 1683.

Hevelius comes next to Flamsteed among the men of his day, as a diligent and accurate observer of the heavens. His 'Firmamentum Sobieskianum' is a standard catalogue of stars, containing the places of 950 stars known to the ancients, 603 observed by himself, and 373

southern stars by Halley. For a full account of all his labours, see Delambre, 'Hist. Astron. Mod.,' vol. ii. pp. 434-484; see also Weidler, 'Hist. Astron.,' p. 485.

HEYDEN, JOHN VAN DER, a very eminent Dutch painter, born at Gorcum about 1637. He is one of the most admirable painters of external architecture of the Dutch, and indeed ranks high among the architectural painters without reference to country or school. His views of temples, palaces, churches, cities, and country-houses, are not only painted with remarkable precision as well as minuteness of detail, but his miniature-like finishing is combined with admirable keeping of the masses, very striking effects of light and shade, and a clear and powerful tone. The value of his early works is enhanced by their being adorned with figures by A. Van der Velde, after whose death, in 1672, Van der Heyden very successfully imitated his manner. His drawings, both in Indian ink and red chalk, are highly valued, as are also his admirable etchings. He died in 1712 at Amsterdam.

HEYLIN, PETER, was born in 1600, at Burford in Oxfordshire, and studied at Oxford, where he took his degree of D.D. He gave lectures on history and cosmography in that university; and afterwards, in 1625, he published his 'Microcosmos,' or description of the globe, which met with great success, and was reprinted several times with alterations and additions. Heylin was appointed chaplain in ordinary to King Charles I., who presented him to several livings, of which he was afterwards deprived in the rebellion, when his own property also was confiscated. On the restoration of Charles II. he was made sub-dean of Westminster, and he died in 1662. He wrote a large number of works on the religious and political controversies of the times, several of which were in the first instance published under an assumed name. He was a very decided follower of Laud in his theological views, belonging to the extreme section of what is termed the High Church party. Among his principal works are, a 'Defence of the Church of England;' 'Cyprianus Anglicus, or a Life of Bishop Laud;' a 'History of Tithes;' a 'History of the Sabbath;' 'Theologia Veterum, the Sum of the Christian Religion contained in the Creed, according to the Greeks and Latins;' 'Examen Historicum, or a Discovery and Examination of the Mistakes and Defects of some Modern Histories,' a work which led to a controversy with Thomas Fuller, whose 'Church History' Heylin attacked with great asperity; 'Cosmography;' 'Ecclesia Restaurata, or the History of the Reformation of the Church of England;' 'History of Episcopacy;' also various works against Calvinism.

HEYNE, CHR. GOTTLÖB, born at Chemnitz in Saxony in 1729, studied at Leipzig, and distinguished himself early as a classical scholar. The chair of eloquence and poetry in the University of Göttingen having become vacant by the death of J. M. Gesner, Heyne was appointed to it in 1763. From that time till his death Heyne was one of the most distinguished members of that learned institution, whose reputation he greatly contributed to uphold both by his lectures and by his publications. The department to which Heyne particularly applied himself was that of classical criticism and the illustration of the writings of the ancients, by showing how they ought to be studied with reference to the manners and character of their respective ages. He published his ideas on these subjects in his notes to the 'Bibliotheca' of Apollodorus, and afterwards in numerous dissertations inserted in the 'Transactions of the University of Göttingen.' His disciples M. Hermann, Voss, Manso, and others, have followed in the same path. Heyne's 'Opuscula Academica,' 6 vols. 8vo, Göttingen, 1785-1815, contain many learned and valuable disquisitions on ancient history. Heyne published editions of Homer, Pindar, Diodorus Siculus, Epictetus, Virgil, Tibullus, &c., all enriched with ample commentaries. His 'Antiquarische Aufsätze,' in 2 vols., are essays on the history of ancient art. As librarian to the University of Göttingen he introduced an excellent method of cataloguing the books of that extensive collection, which under his superintendence increased prodigiously, both in number of works and value. Heyne died at Göttingen at a very advanced age, in July 1814. His life, which has been written at some length by his son-in-law Heeren (8vo, Göttingen, 1813), contains an interesting account of the difficulties that this scholar had to encounter in early life.

HEYWOOD, JOHN, one of our earliest dramatic writers, lived in the first half of the 16th century. He was probably a native of London, was educated at Oxford, and possessed lands at North Mims, in Berks, where he is supposed to have made the acquaintance of his neighbour Sir Thomas More. This lover of wit introduced him at the court of Henry VIII., where his musical skill as a player on the virginals, and his liveliness, both in society and in his writings, gained him high favour. To Queen Mary he was further recommended by his zealous attachment to the Romish Church. In the reign of Edward VI. he was accused of plotting against the government, and is said to have with difficulty escaped the halter. He retired to the continent, and died about 1565, at Mechlin, in Brabant. Heywood's dramatic pieces stand between the miracle-plays and moral-plays on the one hand, and the elaborated dramas on the other. "They may properly and strictly," says Mr. Collier, in his 'History of Dramatic Poetry,' "be called Interludes—a species of writing of which he has a claim to be considered the inventor." The earliest of them, 'A merry Play between the Pardoner and the Frere, the Curate and Neybour Pratte,' was not printed till 1533, but must have been written before

1521. In Dodaley's 'Old Plays' will be found his 'Play called the Foure P. P., a new and a very merry Enterlude of a Palmer, a Pardoner, a Potycary, a Pedlar,' which is a fair specimen of his undramatic arrangements and of the grotesque coarseness of his humour. Among the other productions bearing his name was a posthumous volume of 'Woorles,' 1574, 4to, which contains proverbs in verse, and six hundred epigrams, by which in his own time he was probably best known. In respect of them, and to distinguish him from a later playwright [HEYWOOD, THOMAS], he is not unfrequently called 'The Epigrammatist.'

HEYWOOD, THOMAS, was a well-known dramatist who lived in the reigns of Elizabeth, James I., and Charles I., though, like many of his contemporaries, the dates of his birth and death are unknown. He has been compared to the Spaniard Lope de Vega for fertility, and in his preface to the 'English Travellers' has himself acknowledged that there are two hundred and twenty plays in which he had "either an entire hand, or at least a main finger." The practice of two or more authors uniting to form one play was very common among our old dramatists [CHETTLE, HENRY]. Of all these pieces about twenty-four are left, of which 'A Woman killed with Kindness,' published in Dodaley's 'Collection,' is much admired.

HEZEKIAH, King of Judah, was the son of Ahaz, and was born B.C. 751. At the age of twenty-five he succeeded his father, and the events of his reign are recorded in the Second Book of Kings, in the Second Book of Chronicles, and in Isaiah. He abolished the idolatry practised by his father, even breaking to pieces "the brazen serpent that Moses had made," which had become an object of worship. He purified the temple, restored the Levites to their functions, invited the tribes of Israel to attend the passover, and did all he could to re-establish the worship of the true God. In temporal affairs he displayed a like energy; he threw off the Assyrian yoke to which his father had submitted himself in order to obtain the assistance of Tiglath-Pileser against Rezin king of Syria, who however had taken tribute from Ahaz, and "distressed him but strengthened him not." Hezekiah soon after his accession carried on a successful war against the Philistines, but in the fourth year of his reign, Salmanser (also known as Sargon), the successor of Tiglath-Pileser, attacked Heheh, king of Israel, captured most of his towns, took Samaria after a long siege, and carried away the ten tribes into captivity. Hezekiah was probably alarmed at this approach of the Assyrian power, and seems to have sought the assistance of Tirhakah, king of Upper Egypt. In the fourteenth year of his reign the fears of Hezekiah were realised, Sennacherib invaded Judæa with a large army; and though there is no account in the Scriptures of any battle with the Egyptians, yet the expressions in 2 Kings, chap. xviii., that trusting to Egypt was leaning on a bruised reed, and the passage in Isaiah (chap. xxvii.) of Tirhakah having come forth to war, renders it probable that a battle did occur; and this is confirmed by the discoveries made by Mr. Layard in that part of the ruins of Nineveh now called Koyunjik, where a record has been found in the palace, supposed to have been built by himself, of six years of Sennacherib's reign. This record consists of an inscription in the cuneiform character on a series of colossal bulls. The inscription has been translated by Dr. Hincks of Dublin, and by Sir H. C. Rawlinson. The variations are not material, and the record almost entirely agrees with the Scriptures. This record states that the Egyptians were defeated; it then relates the submission of Hezekiah, and the carrying away of 30 talents of gold and 800 of silver (in 2 Kings it is said 300), the treasures of his palace, and his sons and daughters. There is also a distinct account of the taking of Lachish, and a representation of the suppliant messengers of Hezekiah; but it does not claim the taking of Jerusalem, and there is no allusion to the destruction of the Assyrian army by the plague,—the angel of the Lord who "smote in the camp of the Assyrians an hundred fourscore and five thousand," after which Sennacherib returned and dwelt in Babylon. Herodotus has related also the failure of Sennacherib, but as his information was from an Egyptian source it takes a peculiar colouring. He says Sennacherib, invading Egypt, was attacked in the night by myriads of field-mice, which ate the bow-strings, quivers, straps of shields, &c., so that his soldiers fled in great disorder. The Scriptures relate that he was killed by his sons. This is not found in the record, but he was succeeded by Eearhaddon several years after his return from Judæa. The next events in the life of Hezekiah were the going back of the shadow on the dial of Ahaz, as a proof of the Lord's compliance with his prayer for life; and the exhibiting of the treasures of the kingdom to the ambassador of Merodach-Baladan, king of Babylon, for which Isaiah predicted that all should be carried away to that city. Hezekiah died after a reign of twenty-nine years, and was succeeded by his son Manasseh.

HICKES, GEORGE, an eminent English divine and philologist, was born June 20, 1642, at Newsham, in Yorkshire, where his parents were settled in a large farm. He was first sent to the grammar-school of North Allerton, and in 1659 to St. John's College, Oxford, whence he removed first to Magdalen College, afterwards to Magdalen Hall, and in 1664 was chosen Fellow of Lincoln College. In 1665 he became M.A., and was admitted into orders in 1666. In 1673 he travelled with Sir George Wheeler in France. In 1676 he was made chaplain to the Duke of Lauderdale, whom he accompanied in the following year to Edinburgh, when his grace was appointed high commissioner to

the Church of Scotland. In 1679 he was created D.D. at Oxford, having received the same degree the year previous from the University of Glasgow. Between 1679 and 1683 he had several preferments, and in August was made Dean of Worcester. In 1688 he refused to take the oaths of allegiance, fell under suspension in 1689, and in the month of February following was deprived. He was subsequently consecrated suffragan Bishop of Thetford by Archbishop Sancroft. He died of the stone, December 15, 1715.

Dr. Hickes was a man of general learning, deeply read in the fathers, and particularly skilful in the northern languages. His controversial pieces on politics and religion, especially those against popery, are very numerous, but for the most part have fallen into oblivion. The work which goes by the name of his 'Thesaurus, or Treasure of the Northern Tongues,' in 3 vols. fol., Oxford, 1705, is that which is most likely to sustain his literary reputation.

HIEROCLES, the name of several Greeks:—

1. **HIEROCLES**, a rhetorician of Alabanda, in Caria, lived in the beginning of the first century before the Christian era. He excelled in what Cicero termed the Asiatic style of eloquence. ('De Orat,' ii. 23; 'Brutus,' c. 95.)

2. **HIEROCLES**, a Stoic philosopher, lived in the time of Hadrian, or perhaps later. ('Gell,' ix. 5.)

3. **HIEROCLES**, a lawyer, wrote a work on veterinary medicine, addressed to Cassianus Bassus, of which three chapters are preserved in the 16th book of the 'Geoponica,' published by Needham, Camb., 1704, pp. 424, 425.

4. **HIEROCLES**, who probably lived in the 6th century, was the author of a work entitled 'Synecdemus' (*Συνέδημος*), that is, "A Travelling Companion," which gives an account of the provinces and towns of the Eastern empire. The 'Synecdemus' is printed by Weesseling in his 'Vetera Romanorum Itinera,' Amst., 1735.

5. **HIEROCLES**, præfect of Bithynia, and afterwards of Alexandria, is said by Lactantius ('Inst. Divin,' v. 2; 'De Morte Persec,' c. 17) to have been the principal adviser of the persecution of the Christians in the reign of the Emperor Diocletian. He also wrote two books against Christianity, entitled *Λόγοι φιλαλήθεις πρὸς τοὺς Χριστιανούς* ('Truth-Loving Words to the Christians'), in which, according to Lactantius, "he endeavoured to show that the sacred Scriptures overthrow themselves by the contradictions with which they abound; he particularly insisted upon several texts as inconsistent with each other; and indeed on so many, and so distinctly, that one might suspect he had sometime professed the religion which he now attempted to expose. He chiefly reviled Paul and Peter, and the other disciples, as propagators of falsehood. He said that Christ was banished by the Jews, and after that got together 900 men, and committed robbery. He endeavoured to overthrow Christ's miracles, though he did not deny the truth of them; and aimed to show that like things, or even greater, had been done by Apollonius." ('Inst. Divin,' v. 2, 3.)

6. **HIEROCLES**, a celebrated Alexandrine philosopher of the 5th century, wrote a 'Commentary upon the Golden Verses of Pythagoras,' which is still extant; and also a 'Discourse on Foreknowledge and Fate,' of which Photius has preserved large extracts. Stobæus has also preserved the fragments of several other works, which are ascribed to Hierocles. The Greek text of the 'Commentary on the Golden Verses of Pythagoras' was first published by Curterius, Paris, 1583; reprinted at London, 1654; and has also been published at London, 1742, and Padua, 1744. The fragments of the 'Discourse on Foreknowledge and Fate,' in which Hierocles attempts to reconcile the free-will of man with the foreknowledge of God, have been edited by Morell (Paris, 1593, 1597), and by Pearson (London, 1655, 1673); the latter edition contains the fragments of the other works of Hierocles. A complete edition of his works was published by Needham, Cambridge, 1709. The 'Discourse on Foreknowledge and Fate' was translated into French by Regnaud, Lyon, 1560. Grotius translated part of this work into Latin in his 'Sententiæ Philosophorum de Fato,' Paris, 1624; Amst., 1643; reprinted in the third volume of his theological works, 1679. The 'Commentary on the Golden Verses' has been translated into English by Hall, London, 1657; Norris, London, 1682; Rayner, Norw., 1707; and into French, by Dacier, Paris, 1706.

There is also another work, entitled 'Asteia' (*Ἀστεία*), which contains an account of the ridiculous actions and sayings of pedants, frequently printed with the editions of Hierocles; but it was probably written by another individual of the same name. This work is translated into English in the 'Gentleman's Magazine' for September 1741.

HIERON I., succeeded his brother Gelon, as tyrant or ruler of Syracuse, B.C. 478. He committed many acts of violence, encouraged spies, and kept a mercenary guard about his person. He was ambitious of extending his dominion, and his attempts proved successful. After the death of Theron, prince of Agrigentum, Hieron defeated his son Thrasydæmus, who was soon after expelled by his countrymen. Hieron took Naxos and Catania, and having driven away the inhabitants from both towns, he replaced them by Syracusan and Peloponnesian colonists. He changed the name of Catania into that of *Ἄστια*, and he himself assumed the name of *Ἄστιας*. Having joined his fleet to that of the people of Cumæ, he succeeded in clearing the Tyrrhenian sea of the Etruscan and other pirates which infested it. His chariots

repeatedly won the prize at the Olympic games, and his success on those occasions formed the theme of some of the odes of Pindar, who was his guest and friend. Æschylus, Simonides, Bacchylides, and Epicharmus, were also well received at the court of Hieron, who was fond of the society of learned men. Hieron died at Catana, B.C. 467, and was succeeded by his brother Thrasylbulus, who had all his faults, without any of his good qualities, and was at last driven away by the Syracusans, who restored the government of the Commonwealth. (Diodorus, xi. 48-66.) Ælianus (ix. 1) gives Hieron credit for a much better character than Diodorus; probably the latter part of his reign, after he had firmly established his authority, was better than the beginning.

Coin of Hieron I.

British Museum. Actual size. Silver. Weight 428½ grains.

HIERON II., son of Hierocles, a wealthy citizen of Syracuse, and a descendant of Gelon, distinguished himself in early youth by his brilliant qualities; and he served with distinction under Pyrrhus in his Sicilian campaigns. After Pyrrhus had suddenly abandoned Sicily, the Syracusans found themselves threatened on one side by the Carthaginians, and on the other by the Mamertines, a band of Campanian mercenaries, who had treacherously taken possession of Messana. The Syracusan troops, being in want of a trusty leader, chose Hieron by acclamation, and the senate and citizens, after some demur, ratified the choice, B.C. 275. By marrying the daughter of Leptines, a man of influence among the aristocratic party, he secured their support. Having led the army against the Mamertines, he divided it into two bodies, in the foremost of which he placed the mercenaries in the pay of Syracuse, who had of late shown a mutinous disposition, and ordered them to begin the attack. They did so, but were overpowered by superior numbers; and Hieron, instead of supporting them with his Syracusan soldiers, withdrew, and left them to be slaughtered by the Mamertines. He then recruited his army among his own countrymen, and having deceived the Mamertines, who were waiting for him at the pass of Tauromenium, he marched round the western base of Ætna, attacked and took Tyndaris, Abacenum, Mylae, and other towns, before the main body of the enemy could come to their relief, and lastly defeated the main body itself in a pitched battle on the banks of the river Longanus. He was on the point of attacking Messana, when the Carthaginian commander in Sicily, who was then in the island of Lipara, came to offer his mediation, but in fact for the purpose of introducing a Carthaginian garrison into Messana. In this object he succeeded, having deceived both parties; and Hieron, unwilling to bring on himself the whole might of Carthage, returned to Syracuse, where, through the influence of Leptines, he was proclaimed king, B.C. 270. Shortly after, the Mamertines at Messana quarrelled with the Carthaginians and drove them out of the citadel, upon which the Carthaginians invited Hieron to join his forces to theirs, in order to drive the Mamertines out of Sicily. Hieron having assented, encamped himself under the walls of Messana on one side, and the Carthaginians fixed their camp on the other, whilst their squadron guarded the strait. The Mamertines meantime had applied to the Romans for assistance, claiming a common origin with them as being descended from Mars, called Mamertus in the Oscan language; and Rome eagerly seized this opportunity of obtaining a footing in Sicily. The consul Appius Claudius marched to Rhegium, and having contrived to pass the strait in the night, unobserved by the Carthaginian cruisers, he surprised Hieron's camp, routed the soldiers, and obliged Hieron to seek for safety in flight. The consul next attacked the Carthaginian camp with the same success, and this was the beginning of the first Punic war, about B.C. 264 or 265. In the following year the Romans took Tauromenium and Catana, and advanced to the walls of Syracuse, when Hieron sued for peace, which he obtained on condition of paying 100 talents of silver and supplying the Roman army with provisions. He punctually fulfilled his engagement, remaining faithful to Rome during the whole of the war, and by his supplies was of great service to the Roman armies, especially during the long sieges of Agrigentum and Lilybæum. Hieron was included in the peace between Rome and Carthage, by which his territories were secured to him, and he remained in friendship with both states. He even assisted Carthage at a very critical moment by sending her supplies of provisions during the war which she had to sustain against the disbanded mercenaries. The period of peace which elapsed

between the end of the first and the beginning of the second Punic wars, from B.C. 241 to 218, was glorious for Hieron and prosperous for Syracuse. Commerce and agriculture flourished, and wealth and population increased to an extraordinary degree. Hieron paid particular attention to the administration of the finances, and issued wise regulations for the collection of the tithe or tax upon land, which remained in force throughout Sicily long after his time, and are mentioned with praise as the Lex Hieronica by Cicero (ii. and iii. 'In Verrem'). Hieron introduced the custom of letting the tax to farm every year by auction. He embellished and strengthened Syracuse, and built large ships, one of which, if we are to trust the account given of it by Athenæus (v. 40), was of most extraordinary dimensions and magnificence. This ship he sent as a present to Ptolemæus Philadelphus. Archimedes lived under Hieron's reign. When the second Punic war broke out, Hieron continued true to his Roman alliance, and after the Trasymenian defeat he sent a fleet to Ostia with provisions and other gifts, and a body of light troops to the assistance of Rome. He lived to see the battle of Cannæ, after which his own son Gelon embraced the part of the Carthaginians. Gelon however died, not without suspicion of violence, and Hieron himself, being past ninety years of age, died shortly after, B.C. 216, leaving the crown to his grandson Hieronymus. With Hieron the prosperity and independence of Syracuse may be said to have expired. (Livy, xxii. and xxiii.; Polybius, vii.)

Coin of Hieron II.

British Museum. Actual size. Copper. Weight 282½ grains.

HIERONYMUS, grandson of Hieron II., king of Syracuse, succeeded him on the throne at the age of fifteen (B.C. 216), and under the guardianship of several tutors, among whom was Andronorus, his aunt's husband, who, seconded by other courtiers, and in order to monopolise the confidence of the young king, indulged him in all his caprices and follies. The court of Syracuse, which under Hieron was orderly and respectable, soon became as profligate as it had been under the younger Dionysius. Andronorus persuaded Hieronymus, against the dying injunctions of his grandfather, to forsake the Roman alliance for that of Carthage, and messengers for that purpose were sent to Hannibal in Italy, and also to the senate of Carthage, which gladly agreed to an alliance with Syracuse, in order to effect a diversion against the Romans. The Prætor Appius Claudius, who governed that part of Sicily which the Romans had taken from the Carthaginians, sent messengers to Hieronymus to exhort him not to forget the old friendship existing between Rome and Syracuse. The messengers were received contemptuously, and the young king sneeringly asked them for some details concerning the battle of Cannæ, which had occurred not long before. War being at last declared by Rome, Hieronymus took the field with 15,000 men: but a conspiracy broke out among his soldiers, and he was murdered, after a reign of only thirteen months. On this news a popular insurrection took place at Syracuse, the daughters and grand-daughters of Hieron were murdered, and royalty was abolished. But the people were distracted by factions and by the mercenaries in their pay, and revolution succeeded revolution until two adventurers of Syracusan extraction, but natives of Carthage, who had been sent by Hannibal to keep in countenance the Carthaginian party in Syracuse, became possessed of the chief power, and so provoked the Roman consul Marcellus, that he laid siege to Syracuse.

Coin of Hieronymus.

British Museum. Actual size. Silver. Weight 125½ grains.

HIERONYMUS, a native of Cardia, or Cardiapolis, a town in the Chersonese of Thrace, lived in the times of the immediate successors of Alexander. He wrote a work entitled 'Historical Memoirs' concerning the successors of Alexander the Great and the wars which followed the death of that conqueror, which is mentioned by Suidas, and also by Dionysius of Halicarnæssus in the preface to his history. The work of Hieronymus is unfortunately lost. Diodorus appears to

have made use of it in several parts of his work. Gerrard Vossius ('De Historicis Græcis,' b. 1, ch. xl.) distinguishes Hieronymus of Cardia both from Hieronymus of Rhodes, a disciple of Aristotle, and from Hieronymus the Egyptian, who was governor of Syria under Antiochus Soter, and who wrote a history of Phœnicia, quoted by Josephus, 'Antiqu. Jud.,' b. 1. (See also *Recherches sur la Vie et les Ouvrages de Jérôme de Cardie*, par l'Abbé Sevin, in the *Mémoires de l'Académie des Inscriptions et Belles-Lettres*, vol. xiii.)

HIGDEN, RANULPH or RALPH, author of the 'Polychronicon,' was a Benedictine monk of St. Werburgh's monastery in Chester, where he died at a great age, after having lived in the convent sixty-four years; according to Bale in 1367, according to Pits in 1373. Gale published a portion of Higden's original work in the 'Scriptores,' xv., fol., Oxford, 1691. John de Trevisa's translation of the 'Polychronicon' was printed by Caxton in folio, in 1482, in seven books, to which Caxton added an eighth. The Chester Mysteries, exhibited in that city in 1323, at the expense of the several trading corporations, have been ascribed to Higden. That a monk of the name of Randle, or Ranulph, contemporary with Higden, had some concern in them, there seems no doubt. It is however far from clear that Higden was himself the person.

HIGGINS or HIGINS, JOHN, was born about 1544. He was educated at Oxford, but whether he took a degree is uncertain. He became a clergyman, and was employed as a schoolmaster or tutor. Whilst so employed he compiled a manual for the use of his scholars, under the title of the 'Flosculi of Terence,' which became a very popular school-book; he published likewise an enlarged and amended edition of Holoot's Latin, English, and French Dictionary (folio, 1572), and the 'Nomenclator' of Junius. But he is best known as one of the contributors to the 'Mirror for Magistrates,' of which he edited in 1574 a new edition, and to which he wrote a new 'Induction,' and supplied forty legends, relating mostly to the mythical history of England. In one of the 'envoys,' he tells us that he did not "take the pain to learn the tongues and write" until he was twenty; that French and Latin were his chief studies; and that he published his part of the 'Mirror for Magistrates' when thirty. One stanza from the introduction will give a fair specimen of his manner, and at the same time supply information on the nature of the poem. He tells us that he bought the book on which he was then employed in making additions, and goes on to enumerate those who were celebrated therein:—

"Some perdy were kings of high estate,
And some were dukes and some of regal race;
Some princes, lords, and judges great, that sat
In council still, decreeing every case.
Some other, knights, that vices did embrace;
Some gentlemen; some poor exalted high;
Yet every one had played his tragedy."

The 'Mirror for Magistrates' went through many editions from its first appearance as Lidgate's 'Fall of Princes' to its latest shape in the impression of 1610. The date of the death of Higgins is not known; he was probably living in 1602, as in that year a controversial tract of 'Christ's Descent into Hell' was written and published by him.

HIGHMORE, JOSEPH, a portrait and historical painter of some reputation in his day, was born in London in 1692. He was the nephew of Highmore, serjeant-painter to William III., and was originally bred to the law; but having a decided disposition for painting, he gave up the law, and became the pupil of Sir Godfrey Kneller, in whose style he painted. The city was the first field of his labours, whence he removed to Lincoln's-Inn-Fields, where he painted a set of portraits of the Knights of the Order of the Bath, which has been engraved by John Pine. Highmore was a man of much general information; he had a good knowledge of anatomy, and was thoroughly acquainted with perspective. He used to attend Cheselden's lectures, and he made the drawings for his treatise on anatomy: we owe to him also one of the best practical books on perspective, 'The Practice of Perspective, on the principles of Dr. Brook Taylor, in a Series of Examples, from the most simple and easy to the most complicated and difficult cases,' London, 1763. He published also a critical examination of the apotheosis of James I., painted by Rubens on the ceiling of the Banqueting-House at Whitehall. Highmore painted many portraits of royalty, nobility, and gentry, one of the best of which is that of Young, the poet, at All Souls' College, Oxford. His historical pieces are of little merit: one of the best, 'Hagar and Ishmael,' was presented by him to the Foundling Hospital. Highmore painted several pictures from the works of Richardson the novelist, but his chief works are taken from the Scriptures. He died at Canterbury in 1780, in the house of his daughter, who was married to one of the prebendaries of that city, and he was buried in the cathedral.

HILARION, SAINT, the founder of monastic institutions in Palestine, was born at Tabatha, near Gaza, about 291. His parents, who were heathens, sent him at an early age to Alexandria to pursue his studies, where he made great progress in philosophy and literature. Having been converted to the Christian religion, he resolved, in imitation of Antonius, with whom he had spent two months in the deserts of Egypt, to retire from the world. Accordingly, on his return to Palestine, he divided among his relatives the property which his

parents had left him, and retreated at the age of fifteen to the desert country south of Gaza. After remaining in this place for twenty-two years, during which time he practised the greatest austerities, his reputation for sanctity became so great that numbers of people resorted to him in order to be cured of their diseases. According to Jerome, Hilarion performed the greatest miracles; and "was so full of the power of the Holy Ghost as to be able to discover, from the smell of the bodies and the clothes of men, or of anything else they had but touched, to what particular demon or to what vice they were severally subject." Hilarion afterwards went to Egypt, and successively visited Sicily, Dalmatia, and Cyprus, where he died about the year 371. We are informed by Jerome that, "by the influence of Hilarion's example, innumerable monasteries began to be founded through all Palestine."

The life of Hilarion has been written by Jerome, and is printed in vol. iv., part ii., pp. 74-90, of the Benedictine edition of his works.

HILARIUS, SAINT, was born at Poitiers, of which place he was afterwards made bishop about 350. He is distinguished in ecclesiastical history by the active part which he took against the Arians during the reign of Constantius. He was banished by this emperor to Phrygia, shortly after he had been elected Bishop of Poitiers, on account of his defence of Athanasius, in the council of Béziers, against Saturninus, bishop of Arles. In the East he continued his exertions in favour of the Catholic faith. In 359 he attended the council of Seleucia in Isauria, which had been summoned by order of Constantius, and boldly defended the doctrine of the Trinity against the Arian bishops, who formed the majority of the council. He afterwards followed the deputies of the council to the emperor's court, and presented a petition to Constantius, in which he desired permission to dispute publicly with the Arians in the emperor's presence. In order to get rid of so formidable an opponent, the Arians, it is said, induced the emperor to send him away from the court; but previous to his departure, Hilarion wrote an invective against Constantius, in which he denounced him as Anti-Christ, and described him as a person who had only professed Christianity in order that he might deny Christ. After the Catholic bishops had recovered their liberty under Julian, Hilarion assembled several councils in Gaul for the re-establishment of the Catholic faith and the condemnation of Arian bishops. He also travelled in Italy for the same purpose, and used every exertion to purify the churches of that country from all Arian heresies. When Auxentius was appointed Bishop of Milan by the Emperor Valentinian in 364, Hilarion presented a petition to the emperor, in which he denounced Auxentius as a heretic. Though this charge was denied by Auxentius, Hilarion still continued his attacks upon his orthodoxy, and created so much confusion in the city that he was at length ordered to retire to his own diocese, where he died shortly afterwards, in the year 367.

The most important of Hilarion's works are:—1, 'Twelve Books concerning the Trinity'; 2, 'A Treatise on Synods,' addressed to the bishops of France and Britain, in which he gives an account of the creeds which had been adopted by the Eastern churches since the Council of Nice; 3, 'Three Discourses addressed to Constantius,' on the Arian controversy; 4, 'A Commentary on St. Matthew'; 5, 'A Commentary on the Psalms' (these commentaries are entirely taken from the commentaries of St. Augustine); 6, 'A Book of Fragments,' which contains extracts from several of the last works of Hilarion.

The writings of Hilarion are very obscure, and often unintelligible, which is principally owing to his fondness for antithesis and metaphorical expressions, and to the length and intricacy of his periods. Though he was very severe in condemning the erroneous opinions of others, he differed in many particulars from the doctrines of the Catholic Church, especially in respect to the person of Christ; he held also that the souls of men are material.

The works of Hilarion have been published by Miræus, Paris, 1644; Erasmus, Basel, 1523, reprinted 1526, 1535, 1550, 1570; Gillot, Paris, 1572, reprinted with several improvements 1605, 1631, 1652; by the Benedictines, Paris, 1693; the Marquis de Maffei, Verona, 1730; and Oberthür, 4 vols. 8vo, 1781-83.

(Du Pin, *Ecclesiastical History*, vol. ii., pp. 64-79, English translation; Lardner, *Credibility, Works*, vol. iv., pp. 178, 179.)

HILARIUS, a native of Sardinia, was made deacon of Rome about A.D. 354. He is frequently mentioned by Jerome ('Adv. Lucif.') as a rigid Luciferian, a sect which derived its name from Lucifer, bishop of Cagliari, in Sardinia, who separated from the church on account of the absolute that had been granted to those Catholics who had become Arians during the reign of Constantius. Hilarion wrote several works in favour of the opinions of Lucifer; in which he maintained, among other things, that Arians and all other heretics ought to be baptized again when they were converted to the orthodox faith.

Hilarion is generally supposed to have been the author of a 'Commentary' on thirteen of St. Paul's Epistles, which is usually printed with the works of St. Ambrose; and also, though this is more doubtful, of 'Questions in Vetus et Novum Testamentum,' usually joined with St. Augustine's works. The Benedictine editors of St. Ambrose inform us that the manuscripts of the 'Commentary' on St. Paul's Epistles differ considerably, and that in some parts there appear to be interpolations of long passages. This commentary is said by Du Pin to be "clear, plain, and literal, and to give the meaning of the text of St. Paul well enough; but it gives very different explanations from

St. Augustine in those places which concern predestination, provocation, grace, and free-will."

HILARIUS, SAINT, was born in 401, and became bishop of Arelate (Arles) in 429, on the death of Honoratus, who had been the means of converting him to Christianity. Hilarius was distinguished by the holiness of his life and his zeal for monastic institutions; but he is more known in ecclesiastical history on account of his controversy with Leo, bishop of Rome. Celdonius, bishop of Vesontio (Besançon), who had been deposed from his office by a council, at which Hilarius had presided, appealed to Leo against this decision. Leo gladly availed himself of this opportunity of extending the power of the Roman see, and accordingly reinstated Celdonius in his bishopric. Hilarius strongly opposed the decision of Leo; but his opposition only drew upon him the enmity of the Roman bishop, who soon found an opportunity of depriving Hilarius of the bishopric of Arelate. Several of the Gallic bishops, whom he had offended by the severity with which he had enforced the discipline of the church, accused him of various ecclesiastical offences; and Leo accordingly, supported by a rescript of the Emperor Valentinian III., deposed Hilarius from the exercise of his episcopal duties. Hilarius however still continued to possess great influence in his diocese, in which he died in 449.

Hilarius was highly esteemed by all his contemporaries; even Leo, after his death, declared that he was an upright and pious man. ('Epistles of Leo,' 106.) The writings of Hilarius are lost, with the exception of a life of Honoratus, a letter to Eucherius, and a poem upon the beginning of Genesis; which are published by Quesnell, at the end of Leo's works, Paris, 1675. His life of Honoratus has also been published by Genebrard, Paris, 1578, and from a different text by Barralis, in his 'Chron. sanct. insul. Lerin.' Lugd., 1613; the latest reprint is that of Salinas, in the 'Opera Vincentii Lirinensis et Hilarii Arelatensis,' Rom., 1731.

HILARIUS, a native of Sardinia, succeeded Leo I., or the Great, as bishop of Rome in the year 462. He had been employed by Leo in important affairs; among others he was sent as legate to the council of Ephesus, 449, against the Eutychiens, and was well versed in matters concerning the discipline of the church, which he displayed great zeal in enforcing. He interfered in the election and consecration of bishops by their metropolitans in France and Spain, and he justified his interference by alleging the pre-eminence of the see of Rome over all the sees of the west, a pre-eminence which he however acknowledged, in one of his letters, to be derived from the Emperor's favour. He also forbade bishops nominating their successors, a practice which was then frequent. He however did not declare elections or nominations to be illegal merely from his own authority, but assembled a council to decide on those questions. Hilarius died at Rome in 467, and was succeeded by Simplicius.

HILDEBRAND. [GREGORY VII.]

HILL, AARON, was born at Beaufort Buildings, in the Strand, 1684-85, and having been deprived of an extensive family estate by his father's imprudence, was left dependent on his mother and grandmother. He was educated at Westminster school, and in his sixteenth year went to Constantinople with the design of visiting the English ambassador, Lord Paget, who was a relation of his mother. The nobleman received him kindly, and provided him with a tutor, with whom he travelled through a great part of the East. Having subsequently lost his kinsman's favour, he was engaged by Sir William Wentworth, of Yorkshire, as his travelling companion through Europe. On his return he wrote in 1709, a 'History of the Ottoman Empire,' compiled from materials collected at the Turkish court, and about the same time was made 'master' of Drury Lane theatre. At this time he wrote his first tragedy of 'Elfrida.' He started several commercial projects with indifferent success, and in 1738 withdrew to Plaistow, in Essex, where he devoted himself to study. Here he translated Voltaire's tragedy of 'Merope,' and lived just long enough to see it produced. He died in 1749-50. Aaron Hill wrote about fifteen pieces, of which only two are now remembered, 'Alzira,' and 'Zara,' both of which are adaptations from Voltaire.

HILL, SIR JOHN, was born about 1716, and began life as apprentice to an apothecary in London, in which capacity he gained that knowledge of botany which is his only claim to honourable notice: though being possessed of lively parts, industry, and impudence, he managed to obtain in his lifetime no little notoriety. He pushed his way into fashionable life; published a fashionable and scandalous newspaper called the 'Inspector'; made, puffed, and sold quack medicines; and yet found time to compose a great number of works, many very voluminous, principally on botanical subjects. He was very desirous to obtain admission into the Royal Society; but being rejected, on account of his equivocal character, he published in revenge a 'Review of the Works of the Royal Society,' 4to, 1751, in ridicule of that body, which of course sealed his exclusion from it for ever. Hill obtained a Scotch diploma of medicine, and assumed the title of Sir John in virtue of a Swedish order of knighthood presented to him by the king of Sweden in exchange for a present of his botanical publications. He died in 1775. The following are some of his most considerable works:—'History of the Materia Medica,' 4to, 1751; 'General Natural History,' 1748-52, 3 vols. fol.; 'British Herbal,' 1756, fol.; 'Vegetable System,' 1759-75, 26 vols. fol., a magnificent book, containing 1600 plates, published at 38 guineas plain, and 160

coloured; 'Constitution of Timber from its Early Growth,' fol., 1770, a work highly praised by Haller. (Watt, *Bibl. Britann.*; and a *Short Account of the Life, &c., of Sir J. Hill*, Edinb., 1779.)

HILL, ROWLAND, VISCOUNT, was born on the 11th of August 1772, at the village of Prees in Shropshire, where his father, John Hill, Esq., resided till the death of his brother, Sir Richard Hill, Bart., when he succeeded to the title, and removed to the family mansion and estate at Hawkstone in Shropshire. Sir John Hill had sixteen sons and daughters, of whom Rowland Hill was the second son and fourth child, and was a nephew of the Rev. Rowland Hill, the celebrated preacher. He was educated in his native county, where he remained till 1790, when he entered the army as an ensign in the 38th regiment of foot. Having obtained leave of absence, he went to a military academy at Strasbourg, where he remained till January 24, 1791, when he was appointed lieutenant in an independent company under Captain Broughton. On the 16th of March, in the same year, he was appointed lieutenant in the 53rd, or Shropshire regiment of foot. He went again to pursue his military studies at Strasbourg, but returned to England at the end of the summer, joined his regiment at Edinburgh January 18, 1792, and remained in Scotland till the end of that year. In the early part of the year 1793 he raised an independent company, for which service he received his commission as captain on the 23rd of March. He took his company to Ireland, delivered the men over to the 38th regiment, and returned to Shropshire in June. Lord Hood having taken Toulon from the French in August 1793, Captain Hill, before he was attached to any particular corps, was employed there as aid-de-camp to three successive generals, Lord Mulgrave, General O'Hara, and Sir David Dundas. On the 13th of December 1793, Lord Hood and Sir David Dundas appointed him the bearer of despatches to England, where he arrived on the 14th of January 1794. In the early part of that year Mr. Graham (afterwards Sir Thomas Graham, and subsequently Lord Lynedoch) having raised a regiment of infantry, offered Captain Hill the rank of major in it, on the condition of his supplying a certain quota of men, which he did. This regiment was the 90th, with which he was destined to win so many honours. It was afterwards augmented to 1000 men, and he was promoted to the rank of lieutenant-colonel. On the 1st of January 1800 he was advanced to the rank of colonel.

Colonel Hill went through arduous duties with his regiment at Gibraltar and elsewhere, till, on the 8th of March 1801, he landed with his regiment at Alexandria in Egypt, as part of the army under Sir Ralph Abercromby. He received a wound on the temple in the action of March 13, 1801. After the defeat of the French he returned to England, where he arrived on the 1st of April 1802. He performed regimental duty in England and Ireland till 1805, when he accompanied the expedition to the river Weser in Germany, but was again in England at the end of January 1806, in which year he was promoted to the rank of major-general, and appointed on the staff.

In 1808, when he was on duty in Ireland, he received an order to join the army of Sir Arthur Wellesley in Portugal. He landed his troops successfully in Mondego Bay, August 1st to 5th, and served under Sir Arthur Wellesley till the French evacuated Portugal, according to the terms of the so-called convention of Cintra. He afterwards served with his regiment under Sir John Moore in the latter part of 1808 till the battle of Coruña, January 16, 1809, when he returned with the shattered remains of the army to England.

After a short stay in England, Major-General Hill, in 1809, re-embarked for Portugal, in command of the troops ordered from Ireland for the next expedition, and was promoted to the rank of lieutenant-general. He served under Sir Arthur Wellesley till the 6th of February 1811, when he was compelled by illness to come to England. In May 1811 he was again in Portugal. In March 1812 he was invested by Lord Wellington with the insignia of the Order of the Bath, which had been sent over for that purpose by the Secretary of State. He received a slight wound on the head at the battle of Talavera, and received the thanks of both houses of parliament for his services in that action, as he did on other occasions afterwards. He continued to serve in the Peninsular War till it terminated with the battle of Toulouse. After his return to England Sir Rowland Hill was created, in May 1814, Baron of Almaraz and of Hawkstone, with 2000*l.* a year to himself and his heirs male. The honour was regranted to him in 1816, as Baron of Almaraz and Hardwicke, with remainder, in default of male issue, to the issue male of his deceased elder brother.

On the return of Napoleon I. from Elba, in March 1815, Lord Hill was appointed to a command in the Netherlands, and was engaged at the battle of Waterloo. On the restoration of Louis XVIII., he was appointed second in command of the army of occupation in France, and remained there till the evacuation of the country by the allied armies.

In the year 1828 Lord Hill was appointed the General Commanding in Chief of the Army—an office which he filled with universal approbation till the declining state of his health compelled him to send in his resignation. He was then raised to the dignity of Viscount, September 3, 1842, with remainder to his nephew, Sir Rowland Hill, Bart., who is now the second Viscount Hill. He died December 10, 1842, at his residence, Hardwicke Grange, near Shrewsbury.

A column in honour of Lord Hill, erected by subscription after the termination of the Peninsular War, forms a conspicuous ornament of the town of Shrewsbury.

Lord Hill possessed in rare perfection the qualities which are required to constitute a military commander of the highest class. With careful thought and preparation, he combined in action promptitude, perfect coolness, presence of mind, and fertility of resource. His energy was untiring and unintermitted, and when circumstances required it he exhibited the most daring intrepidity. Strict in discipline, he was at the same time careful of the comfort, health, and lives of his men, and his command over them was unlimited. The Duke of Wellington, throughout the whole of the Peninsular War, treated him with unbounded confidence; and they lived on terms of the most familiar intimacy till Lord Hill's death. His life has been written by Mr. Edwin Sidney, 1 vol. 8vo, 1850. Those who wish for information as to his operations and achievements in Portugal and Spain, will find it given in vivid detail in Napier's 'History of the Peninsular War.'

* HILL, MATTHEW DAVENPORT, was born at Birmingham in 1792, being the eldest of a family of which the five sons have identified themselves in a remarkable degree with the great moral and material improvements of our times. Their father, Thomas Wright Hill, who died in 1851, at the age of eighty-nine, was a native of Kidderminster, and he subsequently settled in the neighbourhood of Birmingham as the head of a school, which in later years became celebrated for the original views of education which were there carried into practice as 'the Hazelwood system.' Mr. Thomas Hill's great merits have been set forth in a 'Brief Memoir,' published in the 'Annual Report of the Council of the Royal Astronomical Society' in 1852. His love of scientific pursuits continued from his earliest to his latest years, and even within a month or two of his death he was occupied in framing a system of nomenclature for the stars. He was equally distinguished for his steadfast adherence to the great principles of civil and religious freedom from his earliest manhood. In the riots of Birmingham in 1791, he bravely strove against a furious mob to defend the houses of Dr. Priestley and of Baskerville the printer; and the same courage, founded upon principle, led his betrothed wife at this perilous time to refuse to utter the party-cry of "Church and King," when the carriage in which she was riding was surrounded by a desperate mob. From such parents the sons derived the qualities which have distinguished them as public men.

After assisting his father several years in the management of the school, which was subsequently removed to Hazelwood, and afterwards to Bruce Castle, Tottenham; and at the same time attending his terms at Lincoln's Inn, Mr. Matthew Hill was in 1819 called to the bar, and was soon engaged in an important state trial, the defence of Major Cartwright on a charge of political conspiracy. The talent and independence which he showed on this occasion gave him reputation, but little profitable employment. The bold course which he had taken was not then the road to professional advancement. He secured however the friendship of eminent men—of Bentham, Brougham, Wilde, and Denman. In 1827 he was associated with Mr. Brougham in the formation and conduct of the Society for the Diffusion of Useful Knowledge, and he was one of its most efficient members. In the first reformed parliament Mr. Hill was returned as representative for Hull. Soon after entering the House of Commons he took up the question of Municipal Reform, and presented the first petition to parliament on that subject. His labours however in this cause may have had an effect in depriving him afterwards of his seat; for at the next election, by the votes of the 'freemen' of Hull, as distinguished from those of ordinary voters under the Reform Act, another candidate was elected in his stead. During the short period (not more than two years) that Mr. Hill was a member of the House of Commons, he strongly supported the bill for allowing persons charged with felony to employ counsel in their defence, and other amendments of the criminal law. He moreover took an active part in obtaining the bill for the establishment of the now flourishing colony of South Australia.

On the erection of Birmingham into a municipal corporation, Mr. Hill was appointed its first Recorder; and in 1851 he was nominated Commissioner of Bankruptcy for the Bristol district. On receiving the latter appointment, Mr. Hill necessarily withdrew from private practice as a barrister; and he has since devoted his time to the discharge of his official duties, and to the general amendment of the law, particularly as regards the treatment of young offenders. His charges to the grand jury, as recorder of Birmingham, contain comprehensive and philosophical views not only of the subject of juvenile crime, but of many questions relating to adult offenders, to the general principles and practice of criminal law, and to other means for the prevention of crime. In the late movement for establishing juvenile reformatories, Mr. Hill has taken a leading part. In 1843, in conjunction with Lord Brougham, Mr. James Stewart, Mr. Commissioner Fane, Mr. Pitt Taylor, and several other friends of Law Reform, Mr. Hill took part in forming the Society for the Amendment of the Law—a society to which is due much of the credit of many of the numerous improvements in the law which have lately been made, and which, being still in full vigour, may become a still more powerful instrument of usefulness. In these labours of his later years Mr. Hill has established a claim to present and future regard, especially in his views of the questions of the treatment of criminal offenders and of the reformation of juvenile delinquents. It is in a great degree owing to Mr. Hill's unwearied perseverance in his official

character, and by various well-timed and able publications, that these subjects have at last come to occupy so much of the attention of statesmen and writers, and that juvenile reform has been raised from the position of a benevolent theory into a great practical principle demanding the co-operation of men of all parties to carry it through its incipient difficulties.

In that remarkable family union which has enabled the sons of the schoolmaster of Hazelwood to do so much in their several walks—each assisting and sustaining the other—Mr. Matthew Hill has derived great support in his views of the treatment of criminals from his brother, Mr. FREDERICK HILL. That gentleman's valuable work 'On Crime' has become a text-book for legislators. This publication was not the result of merely speculative opinions, but of his long experience as Inspector of Prisons in Scotland. When Mr. Frederick Hill was appointed to this office in 1835, almost every prison (the Glasgow Bridewell and a few others being exceptions) was a scene of idleness, drinking, gambling, and filth. Mr. Hill, by his diligence and firmness, made them places of order, industry, and cleanliness. The principle that parents should be held responsible for the maintenance of their children when in prison, was first enforced by him in his official reports from 1842 to 1843. That principle is now adopted as one of the leading points of the Reformatory system. Upon other subjects of social importance arising out of his views of crime, Mr. Frederick Hill has thrown much light; such was his advocacy of a plan to maintain the defence of the country by a voluntary principle, without ballot or impressment. The Militia Bill of 1852, which embodies the voluntary principle, was in part founded upon a pamphlet published by Mr. Frederick Hill in 1848.

* HILL, ROWLAND, the well-known author of the Cheap Postage System, was born at Kidderminster, in December 1795, and was the third son of Thomas Wright Hill. In infancy he was feeble in health, and had it not been for his mother's tender and judicious care he would probably have never arrived at manhood. When still a little child he gave indications of an original and inventive genius, and showed a fondness for large numbers, which has since been turned to so good an account as respects the millions of letters which now constitute Post-Office Revenue. While lying on the rug before the fire on account of a weakness of the spine, he would frequently be heard counting to himself by the hour together, till his number sometimes amounted to hundreds of thousands. At a very early age he supported himself chiefly by teaching mathematics in his father's school, and in private families in the neighbourhood of Birmingham. While still a young man he introduced into his father's school many improvements not only in modes of instruction, but in general organisation, particularly by carrying as far as practicable the principle of self-government, and rendering school duties a far better preparation than they had generally been for the real business of life. In this work he was ably assisted by other members of his family; and the plans of education which he, in part, originated, and which are known as 'the Hazelwood System,' have since been more fully developed and greatly improved by his brother, Mr. Arthur Hill, of Bruce Castle, Tottenham, to which place the school was, about five-and-twenty years ago, removed. In 1833 Mr. Rowland Hill withdrew from the school on account of his health, which had suffered from hard work, intending after an interval of rest to return; but during this time he received the appointment of Secretary to the South Australian Commission, where, in conjunction with several other gentlemen, he rendered signal service in the foundation and organisation of the colony of South Australia.

About this time Mr. Hill had begun to turn his attention to the reformation of the many errors and abuses in the postal arrangements of the kingdom. Early in 1837 he published his pamphlet entitled 'Post-office Reform, its importance and practicability,' and, after long, hard, and persevering labour, he succeeded in introducing, on the 10th of January 1840, his plan of a low and uniform rate of postage; a plan which ever since has gone on maturing and extending; so that, beyond the limits of the British empire with its vast colonies, it is now to be seen in operation, to a greater or less extent, in every part of the civilised world. That part of Mr. Rowland Hill's plan which consists in the use of postage stamps originated in a suggestion by Mr. Charles Knight.

During the anxious and critical period which preceded the final adoption of his plan, Mr. Rowland Hill was ably assisted by his wife, who rose early morning after morning to write from his dictation, and to render him that valuable aid which a common secretary could not have given. Inspired thus with courage to persevere amidst a thousand difficulties, and receiving effective assistance from other members of his family, the plan was at length seriously regarded as practicable, however sneered at and abused.

Long and harassing examinations before a committee of the House of Commons, with laborious preparations beforehand, had to be gone through; amidst little encouragement and much opposition. In the House of Commons Mr. Wallace, late member for Greenock, and Mr. Warburton, late member for Bridport, were most prominent among those who rendered Mr. Hill invaluable assistance.

In 1841 the Tory party came into office, and in the following year Mr. Rowland Hill had to leave the Treasury before his great reform had been completed, though not before the public had been fully

convinced of its important advantages. In 1843 Mr. Hill was offered a directorship in the Brighton Railway; and soon after entering on his new office became Chairman to that Company, in which capacity he continued till shortly before his appointment at the Post-office in 1846. While Chairman of the Brighton Railway, Mr. Hill introduced many improvements on that line, which have been adopted in several instances on other railways. It was his influence in the Board that led to the establishment of express trains, and cheap Sunday excursion trains.

In the year 1844 a testimonial to Mr. Rowland Hill was begun by subscription throughout the united kingdom, as a token of public gratitude towards one who had conferred so great and lasting a benefit upon his country; and so warm was the feeling in its support that a sum of 13,000*l.* was raised and presented to him. In 1846 the Whig ministry having returned to power, Mr. Rowland Hill received from the government a permanent appointment in the Post-office, as Secretary to the Postmaster-General. Innumerable have been the good effects of that appointment, and many important improvements, several of which had been pronounced impossible, have been successfully carried out. In April 1854, on the retirement of Colonel Maberley from the Post-office, the Administration of Lord Aberdeen appointed Mr. Rowland Hill Sole Secretary; an office which he still holds. Mr. Frederick Hill, of whom we have spoken, is now Assistant-Secretary. The plan of postage stamps led to important inventions in their printing by one of the brothers of this family, Mr. Edwin Hill, who is now Surveyor of Stamps. The envelope-machine was invented by him in his connection with the postage-system.

HILLEL, one of the most celebrated of the Jewish Rabbis, was descended on his mother's side from King David; but his father belonged to the tribe of Benjamin. His birth is placed by Bartolucci ('*Biblioth. Rabinic.*' vol. ii., p. 784) in A.M. 3648 (B.C. 112), which agrees with the account of Jerome, who says that he lived shortly before the birth of Christ. According to Jewish tradition he was born in Babylon. At the age of forty he went to Jerusalem, where he applied himself to the study of the law, and became so eminent for his sanctity and knowledge that he was appointed president of the Sanhedrim at the age of eighty. He continued to discharge his duties as president for forty years; he died at the advanced age of 120.

Hillel is not mentioned by Josephus; but it has been supposed that he must have been the same as Pollio, or the high-priest Hananeel.

The disciples of Hillel were very numerous, amounting, according to tradition, to 1000, of whom one of the most eminent was Jonathan Ben Ussiel, the author of the Chaldee paraphrase upon the prophets. The decisions of Hillel on several points in the Jewish law differed from those of Shammai, vice-president of the Sanhedrim; and the disciples of each frequently disturbed the peace of Jerusalem by their divisions and quarrels. Hillel's party at length prevailed, in consequence it is said of a 'bath kol,' that is, a voice pretended to come from heaven. The decisions of Hillel are supposed to have been the ground-work of the Mishna.

Another rabbi of the name of Hillel, the son of Rabbi Juda Nasi, and a descendant of Hillel, of whom we have spoken above, who lived in the 4th century of the Christian era, is said to have established the present calendar of the Jewish year.

HILLIARD, NICHOLAS, limner, jeweller, and goldsmith to Queen Elizabeth and to James I., was born at Exeter in 1547; his father, Richard Hilliard, was high-sheriff of Exeter and Devonshire in 1560.

Hilliard, a jeweller by education, acquired painting by studying the works of Holbein, and he obtained great celebrity as a miniature painter. There are many miniatures, especially of ladies, by Hilliard extant. He painted Mary Queen of Scots, Elizabeth several times, James I., and Prince Henry: he had for twelve years the exclusive privilege of painting and engraving the portraits of James I. and the royal family. Charles I. possessed several of his works, among them a view of the Spanish Armada, "and a curious jewel containing the portraits of Henry VII., Henry VIII., Edward VI., and Queen Mary; on the top was an enamelled representation of the battle of Bosworth, and on the reverse the red and white roses." Hilliard was the master of Isaac Oliver: he died in 1619, and was buried in St. Martin's-in-the-Fields.

HILTON, WILLIAM, R.A., was born at Lincoln on the 3rd of June 1736. His father, who was a portrait painter and a native of Newark, died in 1822. Hilton was placed with J. R. Smith, the engraver, in London, in 1800: he obtained about the same time admission into the Royal Academy as a student, and in 1803 he exhibited at the Academy—exhibition a picture of banditti, of remarkable merit for so young a man. In 1804 he exhibited 'Hector Reinspired by Apollo;' and in 1806 'Cephalus and Procris.' These early works were followed by a series of compositions, in a superior style of execution and treatment. However, neither his subjects nor his style were popular, and he had to witness the success of very inferior artists, while his own works remained on his hands. In 1814 Hilton exhibited 'Miranda and Ferdinand bearing a Log;' and he was elected an associate of the Academy in the same year. He was elected an academician in 1820, when he exhibited his picture of 'Ganymede,' which he presented to the Academy as his diploma piece. In 1825 he exhibited his 'Christ Crowned with Thorns.' Two years afterwards he succeeded Fuseli as keeper of the Academy, a post which he held until his death on the 30th of December 1839, in his fifty-fourth year.

Hilton died in possession of his best pictures—'The Angel Released from Prison;' 'Serena Rescued by Sir Calepine;' 'Comus;' 'The Murder of the Innocents,' exhibited in 1838, the last work exhibited by Hilton; 'Amphitrite;' 'Una with the Lion Entering Corceca's Cave;' and 'Rizpah Watching the Dead Bodies of Saul's Sons' (unfinished). Sir Calepine Rescuing Serena, exhibited in 1831, was purchased by subscription from Hilton's executors, for 500 guineas, and was presented to the National Gallery; but in consequence of an unfortunate selection of the vehicle in which it was painted, portions of the surface have become displaced, and the picture is, for the present at least, withdrawn from exhibition; it was however far from being the best of Hilton's works. 'Una Entering the Cave of Corceca,' exhibited in 1832, was engraved by W. H. Watt for the Art Union of London, and distributed among the subscribers of 1842. 'St. Peter Delivered out of Prison by the Angel,' of which the figures are of the size of life, exhibited in 1831, was purchased by William Bishop of Plymouth. Two capital works by Hilton—'Rebecca with Abraham's Servant at the Well,' exhibited in 1829; and 'Edith and the Monks Searching for the Body of Harold,' exhibited in 1834, form a portion of the collection which Mr. Vernon presented to the nation. The following also are among Hilton's best works:—'Nature Blowing Bubbles,' in the possession of Sir John Swinburne, Bart.; 'Jacob Parting from Benjamin,' purchased by W. Wells, Esq.; 'The Graces teaching Cupid to play on the Lyre,' the property of [Sir George Phillips, Bart.]; 'Cupid Sailing on his Quiver;' 'Cupid and a Nymph;' 'The Rape of Europa,' painted for the late Earl of Egremont, of which there is a print by Charles Heath; and the 'Infant Warrior,' from Shakspeare, exhibited in 1836. The greater part of the above-mentioned works were exhibited with the works of old masters at the British Institution in 1840.

Hilton ranks high among the painters of his own country, up to his own age; but his glory will diminish as the sphere of comparison is extended. He was not a great painter; his energy was not extraordinary, nor was his invention exuberant, and his drawing is often incorrect or exaggerated, but his colouring is harmonious and rich, and his taste in composition and design was refined and manly.

HIMILCON, the name of several Carthaginians.

1. HIMILCON, who is said by Pliny ('*Nat. Hist.*' ii. 67) to have been contemporary with Hanno, was sent by the Carthaginian government to explore the north-western coast of Europe. A few fragments of this voyage are preserved by Festus Avenius ('*Ora Maritima*, l. 90), in which the Hiberni and Albioni are mentioned, and a promontory, Æstrymnis, and islands, Æstrymnides, which are usually considered to be Cornwall and the Scilly Islands. (Gosselin, '*Récherches sur la Géographie des Anciens*,' vol. iv. pp. 162, 163.)

2. HIMILCON, who commanded the Carthaginians in their wars with Dionysius I., tyrant of Syracuse, B.C. 405-368. Himilcon was an able and successful general. He took Gela, Messana, and many other cities in Sicily, and at length besieged Syracuse by sea and land; but he was defeated by Dionysius, who burnt most of the Carthaginian ships. ('*Diodor. Sic.*' b. xiii. xiv.)

3. HIMILCON, a supporter of the Barcine party at Carthage (Livy, xiii. 12), was sent by the Carthaginian government to oppose Marcellus in Sicily. (Livy, xxiv. 35-39; xxv. 23-36.)

HIMMEL, FRIEDRICH-HEINRICH, a German composer of celebrity, the reputed son of Frederic William II. of Prussia, was born in the duchy of Brandenburg in 1765. He was intended for the Church, and studied theology in the University of Halle, but devoted all his spare time to music, in which he became so skilful that the king, his supposed father, encouraged him to pursue the art as a profession, and settled on him a pension to enable him to study it under proper instruction; he chose Naumann as his guide, with whom he made such progress that in two years he produced the oratorio of 'Isacco;' he then travelled into Italy, and at Venice brought out a pastoral opera, 'Il Primo Navigatore.' In 1794 he succeeded Reichardt as kapellmeister at Berlin, and in the following year produced his 'Semiramide.' The operas on which his fame chiefly rests are 'Fanchon das Leiermädchen' ('Fanchon the Lyre-maiden'), and 'Die Sylphen' ('The Sylphs'). His best compositions are a 'Funeral Cantata' on the death of Frederic William in 1799, and a 'Te Deum' for the coronation of his successor.

Himmel wrote many good sonatas for the pianoforte, and his romances, songs, &c., which are very numerous, abound in sweet and original melody. He visited London in 1801, but made only a short stay. He died at Berlin in 1804.

HINCMAR was born in France in 806. He was of a noble family, and nearly related to Bernard, count of Toulouse. At a very early age he was placed under the care of Hilduin, abbot of St. Denis, in which monastery he soon acquired a high reputation for learning and strict observation of monastic discipline. His talents and high birth brought him under the notice of the Emperor Lewis the Meek, at whose court he became a frequent attendant. It was there that, conjointly with the emperor and Hilduin, he formed a plan, which was sanctioned by the council of Paris in 829, of reforming the rules of the monastery of St. Denis, into which many abuses had been gradually introduced. Hilduin, having fallen under the displeasure of his royal master, was banished from the court, and retired to Saxony, whither he was accompanied by Hincmar. On the death of

Hincmar, his successor Lewis, an illegitimate grand-son of Charlemagne, again introduced him to the court of the emperor, who presented him with the government of the abbey of Notre-Dame at Compiègne and St-Germer. On this occasion he evinced his respect for the observance of the canon law, which at that period was often set aside, in requesting the sanction of the bishop of the diocese, and that of his own abbot, previous to accepting that preferment. In the year 845 was assembled the first council of Beauvais, consisting of ten bishops of the provinces of Rheims and Sens. In that council the deposition of Ebbonius, archbishop of Rheims, was confirmed, and Hincmar was elected by the clergy and people to succeed him. During the session of the council of Beauvais, eight articles of convention between the emperor and Hincmar were drawn up, defining the extent of their separate jurisdictions in matters spiritual and temporal. During the same year a council was likewise held at Meaux, presided over by Hincmar and the primates of Sens and Bourges, in which the powers of the metropolitan bishops were more clearly defined and extended.

About this period Godeschalvus, a native of Germany, and monk of Orbais in France, attracted popular notice by a new exposition of the doctrines of St. Augustine on predestination; his peculiar views on this abstruse subject were prominently brought forward during a pilgrimage which he made to Rome, and drew upon him the displeasure of the principal theologians of the day. A council was convened at Mayence by Raban Maurus, archbishop of that city, in which the opinions of Godeschalvus were combated and condemned, the arguments against him being chiefly deduced from the writings of St. Augustine himself. It was there resolved to transmit his case, and to leave the judgment to be pronounced upon him to Hincmar, in whose province was situated the monastery of Orbais. The peculiar opinions of Orbais, magnified by the hostile interpretation of them which Raban sent to Hincmar, brought upon him a severe chastisement from one who had already begun to rule the Church with an iron hand. Hincmar caused him to be accused before thirteen bishops at the council of Quiercy, where he was declared an incorrigible heretic, and deposed from the order of priesthood, into which it appears he had been irregularly admitted. This punishment however was not sufficient to appease the rancour of his judges; the bold enunciation of his tenets was construed into contumacy, and, as such, punishable, according to the rule of St. Benedict, by corporal chastisement: he was condemned to a public flagellation, and to commit his writings to the flames, which sentence was executed with all the cruelty so characteristic of that barbarous period; he was afterwards confined in the monastery of Hautvilliers, where, twenty years afterwards, he ended his miserable existence.

In the year 852 Hincmar embellished and enlarged the church of St. Remy at Rheims, and caused a magnificent vault to be constructed, in which he deposited the relics of its patron saint. The following year he assisted at the council of Soissons, in which all the ministerial acts of his predecessor Ebbonius were declared to be void, the administration of baptism alone excepted. In 857 he composed his first great work on Predestination, the preface of which is the only part extant; in his zeal to combat in it the doctrine of Godeschalvus, he is accused of having fallen into the opposite error of Semi-Pelagianism. About this time also he wrote several letters to Charles the Bald, in which he complains of the frequent pillage of the churches and monasteries, and appears to intimate that the depredators were emboldened, if not by the countenance of the king, at least by the knowledge that the offence would go unpunished. These letters present a singularly interesting picture of the lawless manners of the age. A few years after he wrote a second treatise on the subject of Predestination, which has been preserved. The arguments in it are chiefly directed against the opinions of the learned John Scotus Erigena, whom he accuses of error respecting the doctrine of the Trinity in Unity, and the real presence in the eucharist.

In the year 862 we find Hincmar engaged in controversy with the pope, Nicholas I., one of the most learned ecclesiastics of the age. The occasion of it was as follows:—Rothadius, bishop of Soissons, had incurred the displeasure of his metropolitan, Hincmar, on account of the deposition of a priest of his church, whom Hincmar wished to restore to office. Rothadius, refusing to re-admit this priest, was condemned in two councils held at Soissons, excommunicated, and afterwards deposed and imprisoned. On an appeal of Rothadius to Rome, the pope issued a peremptory order to Hincmar to restore this bishop to his see within thirty days, or to appear at Rome, either in person or by legate, to answer the charge which had been made against him. In the year following Hincmar commissioned Odo, bishop of Beauvais, to proceed to Rome, and to request a confirmation of the decrees of the council of Soissons. Nicholas, irritated at the opposition of Hincmar, rescinded the decisions of that council, and demanded the liberation of Rothadius, in order that he might plead in person at Rome the cause of his appeal. This demand was at first resisted by Hincmar, but through the interference of the king Rothadius was released, and deputies were finally sent by Hincmar to the pope to state the reasons of his conduct. This triumph of Nicholas was soon succeeded by one more important: Rothadius was restored to the episcopal dignity, and he returned to his diocese accompanied by a legate of the pope. The pretensions of Rome in this affair were founded on the 'Decretals of the Ancient Pontiffs,' a work probably

composed by Isidore Mercator, but claiming much greater antiquity. Hincmar, though the most learned canonist of the age, does not appear to have doubted the authenticity of these Decretals.

The interference of the pope in temporal matters was however more successfully resisted. On the death of Lothaire, king of Lorraine, Adrian II. was desirous of excluding Charles the Bald from the succession of his states, and to bestow them upon the Emperor Lewis. To this effect he addressed two letters, one to the nobles of Lorraine and the other to the subjects of Charles, threatening excommunication should they disobey his injunctions to favour the cause of Lewis. Hincmar, in the name of his fellow-subjects, replied to the pretensions of the pope. In his letter he remarks that Adrian should bear in mind that "he is not at the same time king and bishop, and that his predecessors had regulated the church, which was their concern, not the state, which is the heritage of kings." The opposition was successful, and Charles, with the aid of Hincmar and other prelates, took possession of the throne of Lorraine, of which all the subsequent efforts of the disappointed pontiff were unable to deprive him.

In the year 871 Hincmar presided at the Council of Douzi, composed of twenty bishops, assembled by the order of Charles the Bald, for the purpose of inquiring into the conduct of Hincmar, bishop of Laon, nephew of the Archbishop of Rheims. He was accused of spoliation of church revenues, of usurpation of powers not properly belonging to a bishop, and of revolt against his sovereign. His uncle appears to have conducted the trial with severe impartiality, and, on conviction, sentenced him to be degraded from his ecclesiastical office.

About ten years after these events, Hincmar exercised the same firmness in defending the rights of the church against the encroachments of regal authority that he had shown in opposing the claims of the Roman pontiff. Lewis III. wished to bestow the bishopric of Beauvais upon Odaer, a favourite courtier, who had been rejected as unworthy of the office by the Council of Vienne; and he endeavoured, both by supplication and menace, to obtain the acquiescence of Hincmar to his nomination. This prelate however boldly defended the liberty of canonical elections, and the independence of the Church. In a letter addressed to Lewis, he fearlessly reminds him of the sanctity of the oath he had taken to respect the privilege which the Church possesses to refuse induction to unworthy candidates, and warns him against arrogating to himself a power which had been denied to the most eminent of his predecessors. In a second letter he used still stronger language, and terminates it with these ominous words:—"It is your lot soon to depart from this earth, but the Church with its pastors, under J. C. their chief, has, according to his promise, an eternal existence." "This threat," says Fleury, "appeared a prophecy, when the king, while yet in the strength of his youth, died the following year." (Fleury, b. liii. c. 31.)

Hincmar did not however long survive his royal master. About this period the Normans extended their predatory incursions as far as his province, the principal towns of which they pillaged and destroyed. They were advancing towards Rheims when notice of their approach was given to Hincmar, who was obliged to leave the city by night, having previously taken the precaution to secure the treasures of the church and the relics of St. Remy. The aged prelate arrived at Epernay, worn down by fatigue and anxiety. Severe illness compelled him to remain in that town, where on the 21st of December 882 he ended his eventful life.

The name of Hincmar, though associated with the darkest period of ecclesiastical history, will ever be conspicuous as that of one of the most zealous defenders of the liberties of the Church. His great object was to produce that unity among its members which could alone present an effectual barrier against the encroachments of regal and papal authority. The memorable words which he uttered when he heard that the pope was about to visit France, and threatened the excommunication of its bishops, are a sufficient index of his fearless spirit: "Si excommunicatus venit, excommunicatus abibit;" "If he comes to excommunicate, he will return excommunicated."

The principal works not alluded to in this article are—1, 'A Treatise on the Duties of a King,' addressed to Charles the Bald; 2, 'On the Ordeal by Water,' which practice he attempts to authorise by quotations from Scripture, and which unfortunately proves that he was not superior to the superstitions of the age; 3, 'On the Rights of Metropolitan Bishops'; 4, 'On the Translation of Bishops, and on their Duties'; 5, 'On the Council of Nice'; and 6, 'On the Nature and Sanctity of Oaths,' besides several letters and 'Capitularia.' His works have been collected in two volumes folio by the learned Sirmont, Paris, 1645, and another volume was added to this collection by Cellot in 1658.

HIND, JOHN RUSSELL, a distinguished astronomer, was born on the 12th of May, 1823, at Nottingham, where his father, a lace-manufacturer, was one of the first to introduce the Jacquard loom. Young Hind received only the ordinary education of a tradesman's son, and in the science of astronomy may be said to have been self-taught. In 1840 he came to London, and was employed at first in the office of a civil engineer; but as this employment was little suited to the taste which he had acquired for astronomical studies, he obtained, through the influence of Professor Wheatstone, a situation in the Royal Observatory at Greenwich, where he remained from November 1840 to June 1844, profiting largely in his studies by the oppor-

tunity which was afforded him of perusing the books in the library of the observatory. After having been a short time at Kingstown, near Dublin, in connection with a scientific commission sent there by the government, he received, on the recommendation of Professor Airy, the astronomer-royal, an appointment in the observatory of Mr. Bishop, in the Regent's Park, London. Here he commenced in 1845 the series of observations which have since been attended with such extraordinary success in the discovery of planets, comets, and stars, previously unobserved. The planets discovered by Mr. Hind, with the dates of discovery, are as follows:—1, Iris, Aug. 13, 1847; 2, Flora, Oct. 13, 1847; 3, Victoria, Sept. 13, 1850; 4, Irene, May 19, 1851; 5, Melponene, June 24, 1852; 6, Fortuna, Aug. 22, 1852; 7, Calliope, Nov. 16, 1852; 8, Thalia, Dec. 15, 1852; 9, Euterpe, Nov. 8, 1853; 10, Urania, July 22, 1854. Besides these planets, Mr. Hind discovered, on the 29th of July 1846 a comet, which had been seen two hours previously at Rome by De Vico; and on the 6th of February 1847, another comet, which he observed till the perihelion passage on the 24th of March, when it was bright enough to be visible in strong morning twilight. He has also discovered several stars not previously seen.

In December 1844 Mr. Hind was chosen a member of the Royal Astronomical Society of London, and was afterwards appointed foreign secretary to the society. In 1846 he was named foreign secretary to the Philomatic Society of Paris, and in 1847 corresponding member. In 1851 he was chosen corresponding member of the Academy of Sciences of the Institute of Paris. In 1852 the council of the Astronomical Society of London awarded him their gold medal "for his astronomical discoveries, and in particular for the discovery of eight small planets," and the British government granted him a pension of 200*l.* a year "for important astronomical discoveries." He is also superintendent of the 'Nautical Almanac,' published by the British government.

Mr. Hind's scientific investigations have been published chiefly in the 'Transactions' of the Royal Astronomical Society of London, and in the 'Comptes Rendus' of the Academy of Sciences of Paris. In the course of the last ten or eleven years he has calculated the orbits of a large number of planets and comets, and the results of his labours have appeared in the above-named scientific periodicals.

Mr. Hind's separate publications are of a popular character. In 1846 he published in the 'Athenaeum' (Aug. 9) an account of 'Recent Comets and the Elements of their Orbits,' and in 1848 a pamphlet 'On the expected Return of the Great Comet of 1264 and 1556.' The following works were published in 1852:—'An Astronomical Vocabulary, being an Explanation of all the Terms in use among Astronomers at the present Day,' 16mo; 'The Comets: a Descriptive Treatise on those Bodies, with a condensed Account of the numerous modern Discoveries respecting them, and a Table of all the Calculated Comets from the earliest Ages to the present Time,' 12mo; 'The Solar System; a Descriptive Treatise upon the Sun, Moon, and Planets, including an Account of all the recent Discoveries,' 8vo, in the series entitled 'Readings in Popular Literature.' In 1853 he published 'Illustrated London Astronomy, for the Use of Schools and Students,' 8vo. These works, cheap and unpretending as they are, contain a large amount of useful information, and entertaining also, for general readers unacquainted with the principles of astronomy as a science.

HIPPARCHUS. [PBISTRATUS.]

HIPPARCHUS, the first astronomer on record who really made systematic observations, and left behind him a digested body of astronomical science. He was born, according to Strabo, at Nicæa in Bithynia, and was alive, as appears from his observations preserved by Ptolemy, in the interval B.C. 160-125; but neither the year of his birth nor that of his death is recorded. His astronomical observations were probably commenced in Bithynia, and certainly continued at Rhodes; whence he is called by some authors the Bithynian, and by others the Rhodian, and some even suppose two astronomers of the same name, which is certainly incorrect. He is also supposed to have observed at Alexandria; but Delambre, comparing together such passages as Ptolemy has preserved on the subject, is of opinion that Hipparchus never speaks of Alexandria as of the place in which he resided; and this opinion of Delambre appears to us to be correct.

The proper place for an account of the discoveries of Hipparchus is in connection with notice of the 'Syntaxis' of PTOLEMY, or the Almagest, and for this reason, that the loss of the writings of Hipparchus has left us without any specific account of his discoveries except that contained in the 'Syntaxis.' And since it is a matter of very great doubt whether Ptolemy made observations himself to any extent, and since it is also certain that he drew his catalogue of stars, and nearly all the observations on which his theory is founded, from Hipparchus, the notice just alluded to would necessarily contain all that is to be said on the subject. We shall therefore here content ourselves with citing the works which Hipparchus is said to have written, and the résumé of his labours given by Delambre.

The titles of the writings attributed to Hipparchus, on whom Ptolemy has fixed the epithet of 'φιλόσοφος καὶ φιλάληθης' ('the lover of labour and truth'), have been collected by Fabricius, and are to be found in Weidler, as follows:—1, *Περὶ τῶν ἀπλανῶν ἀναγραφὰς*; 2, *Περὶ μεγεθῶν καὶ ἀποστήματων*; 3, *De XII Signorum Ascensione*; 4, *Περὶ τῆς κατὰ πλάτος μηνιαίας τῆς σεληνῆς κινήσεως*; 5, *Περὶ μηνιαίου χρόνου*;

6, *Περὶ ἐνιαυσίου μεγέθους*; 7, *Περὶ τῆς μεταπτώσεως τῶν τροπικῶν καὶ ἰσημερινῶν σημεῖων*; 8, 'Adversus Eratosthenis Geographiam'; 9, *Τῶν Ἀράτων καὶ Ἑυδόξου φαινόμενων ἐξηγήσεων βιβλία γ*. The only one of these which has come down to us is the last and least important—the commentary on Aratus, written probably when Hipparchus was young, since he does not mention any of his subsequent discoveries; and the results of observation are not so correct as those of his catalogue. This work was published by Peter Victorius, Florence, 1561, and by Petavius in his 'Uranologion,' 1630. Hipparchus also wrote a work, according to Achilles Tatius, on eclipses of the sun; and there is also recorded a work with the following title: 'Ἡ τῶν ἀνατολῶν πραγματεία.'

The following summary is from the preface to Delambre's 'History of Antient Astronomy,' in which work will be found the most complete account of the labours of Hipparchus. The bias of this historian seems to be, to add to Hipparchus some of the fame which has been generally considered due to Ptolemy, for which he gives forcible reasons:—"Let no one be surprised at the errors of half a degree which we attribute to Hipparchus, seemingly with reproach. It must be remembered that his astrolabe was nothing but an armillary sphere, of no great diameter, and with very small subdivisions of a degree; as well as that he had neither telescope, vernier, nor micrometer. What should we do even now if deprived of these helps, and if we knew neither the refraction nor the true altitude of the pole, on which point, even at Alexandria, and with armillæ of every sort, an error of a quarter of a degree was committed! At this day we dispute about a fraction of a second: they could not then answer for any fraction of a degree, and might be wrong by a whole diameter of the sun or moon. Let us rather think of the essential services which Hipparchus rendered to astronomy, of which science he is the true founder. He was the first who gave and demonstrated methods of solving all triangles, whether plane or spherical. He constructed a table of chords, of which he made nearly the same use as we now do of our tables of sines. He made many more and much better observations than his predecessors. He established the theory of the sun in such a manner that Ptolemy, 268 years afterwards, found nothing to change. It is true that he mistook the inequality of the sun's motion; but it can be shown that his mistake arose from an error of half a day in the time of the solstices. He himself avows that he may have been wrong by a quarter of a day; and we may always safely suppose that, without impeachment of an author's integrity, his self-love may halve the error which he is really liable to commit. He determined the first inequality of the moon (the equation of the centre), and Ptolemy found nothing to change in his result: he gave the mean motion of the moon, and that of the apogee and nodes, in which the corrections made by Ptolemy were slight, and of more than doubtful goodness. He had a sight of the second inequality (the evection); it was he who made all the observations necessary for a discovery of which the honour was reserved for Ptolemy; a discovery which he had not perhaps time to finish, but for which he had prepared everything. He showed that all the hypotheses of his predecessors were insufficient to explain the two-fold inequality of the planets; he predicted that none would be successful which did not combine the two hypotheses of the eccentric and epicycle. He had not the proper observations, because they require more time than the duration of the longest life; but he made them ready for his successors. We owe to his catalogue the important knowledge of the retrograde motion of the equinoctial points. We might, it is true, have derived this knowledge from much better observations, made within the last hundred years; but we should then have had no proof that this motion remains sensibly the same through a long course of ages; and the observations of Hipparchus, by their number and their antiquity, and in spite of the errors which we are obliged to admit, give important confirmation to one of the fundamental points of astronomy. It is to him that we owe the first discovery of this phenomenon. He also invented the planisphere, or the method of describing the starry heavens upon a plane, and of deducing the solution of problems in spherical astronomy by a method often more exact and convenient than that of the globe itself. He is also the father of real geography, through the happy idea of marking the position of towns in the same manner as that of the stars, by circles drawn through the pole perpendicularly to the equator, that is, by latitudes and longitudes. His method, by means of eclipses, was for a long time the only one by which the longitude could be determined; and it is by means of the projection of which he was the author that we now make our maps of the world and our best geographical maps."

HIPPIAS. [PBISTRATUS.]

HIPPO, a Greek philosopher, who is called by some a native of Samos and a follower of Pythagoras, and by others a native of Rhegium, in southern Italy. With regard to his age, some writers have made him a contemporary of Thales, or have placed him even before the age of Thales; but he evidently belongs to a much later time, and was perhaps a contemporary of the comic poet Cratinus (about B.C. 450), who ridiculed him in one of his last comedies; further, Hippo mentions the four elements of the physical philosophy of Empedocles in such a manner that we must infer that he was acquainted with the theory of Empedocles. Aristotle ('Metaphys.' i. 3) does not appear to attach any great value to the philosophical system of Hippo, which in fact was that of Thales, with sundry additions and

modifications. He thus went back to the materialism of the early Ionic school; and as Thales had taken water, so Hippo took moisture to be the principle of all things. (Aristot. 'De Anima,' i. 2; Plutarch, 'De Placit. Philoa.' 5.) He explained his views in a work which seems to have been called *φυσικά δόγματα*, which however owing to its insignificance, appears to have fallen into oblivion at a very early period, and scarcely any fragments of it have come down to us. Clemens of Alexandria ('Cohortat. ad Gent.' vol. i. p. 48, ed. Potter) has preserved an epigram of Hippo, which is also printed in the editions of the Greek Anthology. (Iamblichus, *De Vita Pythag.* 36; Sextus Empir. *Pyrrhon. Hyp.* iii. 30, *adv. Mathem.* ix. 361; Scholiast. *ad Aristoph. Nub.* 97; compare Brandis, *Geschichte der Griech. Römischen Philosophie*, vol. i. p. 121, &c.; Bakhuizen van den Brink, *Varia Lectiones ex Historia Philosophia Antiqua*, pp. 36-59; Brucker, *Hist. Crit. Phil.* i. 1103.)

HIPPOCRATES was born at Cos, B.C. 460. His family followed the pursuit of medicine for near three hundred years, and produced seven physicians, who attained considerable celebrity, and who are supposed to have written the numerous treatises which are commonly attributed to Hippocrates alone. Before their time the knowledge of medicine was either confined to the priests, who employed their skill in maintaining their influence over the people, and carefully concealed the little knowledge they possessed, or was merely followed as a subordinate pursuit by the philosophers of the day. It is to the Aesclepiads that the science of medicine is indebted for a separate existence, and the great progress which it made in their hands after this separation sufficiently proves the wisdom of their proceeding.

The most celebrated of the family was the subject of the present notice, Hippocrates, the son of Heraclides and Phemarete, who is supposed to have been the author of this important revolution in medicine. It would have been interesting to give some details of his personal history, but unfortunately we possess few authentic materials for this purpose, except some fragments contained in his life by Soranus. His medical studies were pursued under the superintendence of his father and of Herodicus; and he is said to have had for his masters in philosophy Gorgias of Leontini, the celebrated sophist, and Democritus of Abdera, whose cure he afterwards effected. We are told that he spent some time at the court of Perdiccas, king of Macedonia, and visited Thrace and Scythia; and it is probable that these statements are true, as mention is made in his writings of several towns in Thrace (Suidas, *Ἰπποκράτης*). Soranus states that he delivered Athens from the ravages of a dreadful plague which was raging in the city: but this can hardly be the one which occurred in the second year of the Peloponnesian war, of which such a graphic description is given by Thucydides; for though Thucydides suffered from the disease himself, and was a witness of its ravages, he makes no mention of the name of Hippocrates, but on the contrary declares that medical skill was of no avail against it.

We have already observed that many of the works usually attributed to Hippocrates were in reality the productions of various members of his family. This circumstance alone would render it impossible to determine accurately the amount and value of his contributions to the science of medicine. But this difficulty has been still further increased by the manner in which his writings were mutilated, and fresh passages interpolated by later editors. This confusion is supposed to have been introduced into his writings at the time when the Ptolemies were forming their celebrated library at Alexandria, for the high value which was set upon ancient writings by these monarchs induced men to collect and forge copies of ancient authors, which they passed off for the genuine works of those to whom they were attributed. It appears that in the time of Galen they were able in some degree to distinguish the genuine writings of Hippocrates from those falsely attributed to him. All the writings assigned to Hippocrates are written in the Ionic dialect, but he does not adhere so closely to its forms as Herodotus.

The principles of Hippocrates were those of rational empiricism. He did not attempt to form his theories from *à priori* reasoning, but he observed the phenomena of nature and deduced from them such conclusions as these phenomena would justify. That he adhered to this principle in all cases however is not to be supposed. He taught that the body is composed of four primary elements—fire, water, earth, and air; that these elements, variously combined, produce the four cardinal humours, and these again the different organs of the body. These doctrines are principally developed in the treatise 'On the Nature of Man;' and Galen asserts that he was the author of this theory, which was afterwards adopted and more generally promulgated by the genius of Plato. His knowledge of anatomy seems to have been very limited. The superstitious respect which was paid to the remains of the dead among the Greeks prevented him from acquiring any knowledge on this subject by dissection of the human body. He gives such descriptions of the bones as show that he had indeed studied the subject, but not acquired any very accurate knowledge. The muscles are described under the general term of *σῆα* (*σάρες*), and though some explanation is given of them in the treatise 'On Art,' this is probably spurious. The term *phlebs* (*φλέψ*) is applied indiscriminately to the veins and arteries, while *arteria* (*ἀρτηρία*) is confined exclusively to the trachea. His description of the vessels is confined to the course of some of the larger ones, without expressing

any opinion as to their origin. He does not seem to have supposed that they originate either in the heart or liver. These views were first propounded in the school of Alexandria. Under the term *seres* (*σείρες*) he confounds all the white tissues of the body, the nerves, properly so called, the tendons, and ligaments. According to Hippocrates the brain is glandular and secretes the pituita, or mucus. In his pathology he confines himself principally to the investigation of the remote causes of diseases, without entering into many speculations on their nature. However he explains inflammation by the passage of blood into those parts which did not previously contain it. In this case we still require to be informed how the blood passes into these parts. He paid great attention to the effects of changes in the external conditions of life, namely air, warmth, moisture, food, upon its phenomena, and those of disease. He recommended that particular attention should be paid to the constitution of the seasons.

Among the doctrines of Hippocrates, that of critical days, upon which he supposed the evacuation of the morbid matter when conducted to take place, is the most remarkable. In his 'Prognosticones' he says, fevers come to their crisis on the same days, both those which turn out fatally and those which turn out well. These days are the fourth, the seventh, the eleventh, fourteenth, seventeenth, and twentieth. The next stage is of thirty-four days, the next of forty, and the next of sixty. It appears very doubtful how far this theory was borne out by actual observation, but it is possible that it may have been more nearly true under the treatment of Hippocrates, which was not usually very active, than under the more energetic treatment of modern physicians. Of the indications to be drawn from examination of the pulse Hippocrates was not aware, and the word *sphygmus* (*σφυγμὸς*) is usually employed by him to denote some violent pulsation only. It is however upon the accuracy with which he observed the leading features of disease, and his vivid descriptions of them, that the fame of Hippocrates is principally and justly founded. Nowhere is the peculiar power of the Greeks in expressing their conceptions more strikingly shown. We have extracted one or two of the most marked descriptions from his 'Prognosticones.' "If the appearance of the patient be different from usual, there is danger. If the nose be sharp, the eyes hollow, the temples collapsed, the ears cold and contracted, and the lobes inverted, whilst the skin of the forehead is hard, dry, and stretched, and the colour of the face pale or black, or livid or leaden, unless these appearances are produced by watching or diarrhoea, or under the influence of malaria, the patient is near death." This description has obtained the title of *Facies Hippocratica*. And other descriptions of premonitory symptoms of danger are no less graphic and precise. In the remainder of this treatise he goes through the different evacuations from the bladder and the bowels, by vomiting and by expectoration, describing their characters and appearances, and the conclusions that may be drawn from them. His directions for the examination of a patient supposed to be labouring under empyema present an example of sound and cautious investigation. "If there is empyema on one side of the chest, we must turn the patient, and learn whether he has pain in one side, and if one side be hotter than the other; while he is lying on the sound side, we must ask if he feels any weight hanging from above. For if this be the case, the empyema is on that side on which he feels the weight. We may recognise the presence of empyema by these general signs:—if the fever does not remit, but is moderate during the day and increased at night, and considerable perspirations occur, and there is great inclination to cough and but little expectoration; while the eyes become hollow, the cheeks are flushed, the finger-nails curved, and the fingers hot, especially the tips, and the feet swell, and pustules are formed over the body—these symptoms denote chronic empyema, and may be greatly relied on." We must not forget that Hippocrates asserts that auscultation may be employed to distinguish between the presence of pus and serous fluid in the cavity of the pleura. No attention seems to have been paid to this remarkable statement until the time of Laennec's great discovery, by whom the passage is noticed and referred to. The statement of Hippocrates is in itself incorrect, but the fact of his having actually practised auscultation is no less interesting.

Hippocrates appears also to have introduced some valuable improvements in the treatment of disease. During health he recommends that the diet should not be too exact, lest any unavoidable change should bring on disease. Of wine he says it must not be taken pure during the summer, but in the winter he allows a more liberal use of it. In his treatise 'On Diet' he claims to have been the first to recognise the importance of diet in the treatment of disease, which had been neglected by all previous physicians; and in this statement he is in some measure borne out by the authority of Plato ('De Rep.' iii. 14), who praises the ancient physicians for having neglected it; whereas the modern ones, by this system, convert life into a tedious death. However, he attributes the introduction of the new system to Herodicus. In fevers and acute diseases he confined his patients to a liquid diet, but not so strictly as some other physicians, whom he charges with starving their patients to death. In his general treatment he employed purgatives, some of which were of the most violent character, as the black and white hellebore and elaterium, which generally produce excessive vomiting at the same time. He mixed up a little theory with his treatment; for he would not allow purga-

tives to be employed unless the humours were duly concocted. To relieve the head in certain diseases he was accustomed to make use of sternutatories. In acute affections, when the disease was violent, he employed bleeding, and recommended that blood should be taken from as near the affected part as possible. This was the origin of the doctrine which recommended bleeding in pleurisy from the arm on the side affected. He also made use of cupping-glasses, with and without scarification. Certain diuretic and sudorific medicines also entered into his pharmacopœia, and he was not ignorant of the virtues of the poppy.

In the time of Hippocrates the distinction between medicine and surgery had not been made, as we find among the works usually attributed to him, and contained in the list of Erotian, treatises on fractures, on ulcers, and on wounds of the head. In the latter he was in the habit of employing the trephine, and gives directions for its use. However, in the oath of Hippocrates the pupil is made to swear that he will not attempt the operation of lithotomy, but give it up to those whose business it is to perform it. In the treatise 'On Injuries of the Head,' he remarks that convulsions usually take place on the side of the body opposite to the injury.

We find that consultations were not unknown in the time of Hippocrates, for in the latter part of the 'Præcepts' he says that a physician ought not to be ashamed to call in the assistance of another, if he finds himself at a loss in the treatment of his patient. The oath which he administered to his pupils shows the high sense he had of the duties and responsibilities of a physician. The pupil is made to swear "that he will reverence his teacher as a father, and his descendants as brethren; that he will use his art to the benefit of his patients, and never to their injury or death, even if requested by them; that he will never attempt to procure abortion, that he will be chaste, and never divulge any professional secrets." Similar sentiments are expressed in the treatise 'On the Physician,' but it is doubtful whether this is a genuine production of Hippocrates. As we have remarked above, Hippocrates wrote in the Ionic dialect, though the island in which he was born was originally colonised by the Dorians. His style is remarkably concise, so as to render his meaning at times somewhat obscure; and it would appear that he occasionally makes his statements too general, in order to avoid loading his writings with exceptions. The high estimation in which his works have been held is proved as well by the general reputation of his name, as more especially by the numerous commentaries upon them which have been published in all ages. It will be sufficient to mention the names of Asclepiades, of Rufus Ephesianus, of Celsus, and of Galen, who have all commented upon his writings. Galen declares that we ought to reverence them as the voice of the Deity, and that if he has ever written too concisely or somewhat obscurely, he has never written anything which is not to the purpose. His knowledge of anatomy and physiology, and of the processes which go on in the body during health and disease, was extremely deficient, but in the accuracy with which he observed the symptoms of disease, and in the fidelity of his descriptions he has rarely, if ever, been surpassed. It is upon these grounds that he has justly obtained the title of 'The Father of Medicine,' and will at all times continue to command the respect of his medical descendants.

Hippocrates is said to have died at a very advanced age at Larissa in Thessaly. The essays of which he is the reputed author are seventy-two in number, but the best commentators on them do not allow more than fifteen or twenty to be genuine. The most esteemed of them are the essays on Air, Water, and Locality; the first and third books of that on Epidemics, the Aphorisms, the Essay on Prognostics, that on Wounds of the Head, and that on the Diet in Acute Diseases. The best editions of his works are those of Foesius, Frank, folio, 1595, which was reprinted several times; of Linden, 2 vols. 8vo, Amsterdam, 1665; of Mack, 2 vols. folio, Vienna, 1743-49; and of Littré, Paris, 1839, &c. They have been most voluminously commented on. From a list which Foesius gives of all the works published upon them previous to 1595, it appears that 137 authors had written upon the 'Aphorisms' alone, and the commentaries and criticisms upon the rest of his essays would be sufficient by themselves to form an extensive library. Many of the treatises have been edited separately. There is a complete German translation of Hippocrates by J. F. C. Grimm, Altenb., 1781-1792, 4 vols. 8vo.

(Sprungel, *Histoire de la Médecine*; Haller, *Bibl. Medic. Pract.*; Littré's ed. of *Hippocrates*.)

HIPPOLYTUS, a bishop, saint and martyr, of the first quarter of the third century, who, from circumstances to be presently mentioned, has recently excited great interest amongst scholars and theologians. It was the apparently unquestioned belief among the older Christian writers that an eminent ecclesiastical author, Hippolytus, had resided as bishop at Portus Romanus, near Ostia, and that he had there been put to death by the emperor Alexander Severus towards the end of his reign. But certain difficulties in the statement, coupled with the fact of Severus not having persecuted the Christians, and of there being no other instance recorded of a bishop of Portus, as also the occurrence of some points of similarity between this Hippolytus and other Hippolyti recorded in the Roman martyrologies, led to attempts to controvert or explain away the difficulties in the common account. Thus Le Moyne sought to show that Hippolytus was bishop of Adana (Aden), then the great emporium of the Roman commerce with the

East, and consequently known as the Portus Romanus; his views found many followers, and though never generally adopted the opinion prevailed that Hippolytus was in fact an Arabian, or at least an Eastern bishop. But whilst there was so much doubt as to the time and place where Hippolytus flourished, there was none as to the eminent position he held as a writer and confessor of the ancient church. Eusebius, Jerome, and other eminent fathers, alike refer to him in terms of profound regard, and the Romish church had long set apart a day (August 21, in later years August 22), in commemoration of St. Hippolytus, bishop and martyr. In 1551 there was discovered at Rome, near a church dedicated to St. Laurence, a statue—the work apparently of an artist of not later than the 6th century—representing a bishop seated, somewhat above the size of life, having inscribed on it the name of Hippolytus, bishop of Portus, and on the back of the chair the paschal cycle which he introduced at Rome, and a list of his principal writings. His works, or such of them as remained, including some of very doubtful authenticity, were collected and published by Fabricius in 1716-18, and again by Gallandius in 1766; but some of the most remarkable of those enumerated on the statue had escaped the research of the editors and of later investigators.

Thus remained the information possessed respecting Hippolytus when, in 1842, an agent of the French government, M. Menas, obtained at Mount Athos among other manuscripts one in Greek on the subject of 'Heresies.' It was placed in the Bibliothèque du Roi at Paris, where it remained without attracting any notice till an excellent Greek scholar, M. Emmanuel Miller, in pursuing some researches there examined this manuscript, and perceived that it was not only an ancient but an hitherto unpublished work. He at once addressed himself to the laborious task of preparing a copy of it for the press; and the University of Oxford having undertaken the expense of the publication, it was in 1851 printed at the University press under the superintendence of M. Miller, with the title, 'Πηγύς φιλοσοφίμων ἢ κατὰ πασῶν αἱρέσεων ἐλεγχος. Origenis Philosophumena sive omnium Hæresium Refutatio: e Codice Parisino nunc primum edidit Emmanuel Miller,' 8vo, pp. 339. This work immediately excited general interest among the scholars of Germany and France as well as of England, and its great importance in connection with the early history of the church was at once perceived; but at the same time it became evident that it was incorrectly assigned to Origen, whose known works it in no way resembled, whose opinions it often differed from, and to whom no such work had been by any early author ascribed.

The subject was first brought directly before the English public by Chevalier Bunsen in 1852, in a most laborious work (embodying the studies in theology and ecclesiastical history of many years), entitled 'Hippolytus and his Age; or the Doctrine and Practice of the Church of Rome under Commodus and Alexander Severus, and Ancient and Modern Christianity and Divinity compared,' 4 vols. 8vo. In this work M. Bunsen undertook to show that the 'Refutation of all the Heresies,' ascribed by M. Miller to Origen, was really the lost work of Hippolytus, mentioned under the same title as his by Eusebius, Jerome, Epiphanius, and Peter, bishop of Alexandria, and also inscribed on his statue. This view he supported with great learning and ability, and though other scholars had fixed on Caius, on Ignatius, and even on Tertullian, there appears to be now a pretty general acquiescence in the Chevalier's views as to the writer. We give the summary of his statement in his own words:—"We may sum up the arguments brought forward in a few words. The book cannot have been written by Origen, nor even by Caius the presbyter, for it is written by a bishop; besides nobody (i.e., no early Christian writer) ever attributed to the Alexandrian or to the Roman presbyter a book with a like title. On the other hand, such a book is ascribed by the highest authorities to Hippolytus, bishop of Portus, presbyter of the Church of Rome, who lived and wrote about 220, as the 'Paschal Cycle' and his statue expressly state." ('Hippol.,' i. 335.) M. Bunsen's opinions on some other points (chiefly of theology and philology) have however met with much opposition, and he in 1854 replied to his opponents, and re-stated with additional proofs his theory respecting the work on 'Heresies,' in a new and greatly-enlarged edition, in 7 vols. 8vo, of his 'Hippolytus and his Age.' With the theological or general controversy we have here nothing to do. It has in its various sections engaged the pens of many eminent scholars and theologians of all churches and sects in England and on the Continent; and besides several distinct works (of which that of Dr. C. Wordsworth, entitled 'St. Hippolytus and the Church of Rome in the earlier part of the Third Century,' 8vo, London, 1853, and his 'Remarks on Bunsen,' 8vo, 1855, are perhaps the most important which have been published in London), essays of greater or less learning and acumen have appeared in every review and almost every denominational journal of any note in the English language, in the 'Journal of Classical and Sacred Philology,' and in most of the leading German philological and theological magazines. But the investigation which the subject has undergone will enable us to state in a few words what is now known of Hippolytus.

It would appear that he was in the active exercise of his labours as Bishop of Portus, near Ostia, about 218. Though not a corporate and fortified town (civitas), Portus, as the adjacent harbour of Rome, was a place of considerable importance; and being frequented by foreign merchants and traders as well as seamen, it is probable, as Bunsen

suggests, that Hippolytus was specially appointed to preside there with a view to their conversion and instruction, and hence the title we find applied to him of 'Bishop of the Gentiles.' Being a suburban bishop, he was a member of the presbytery of Rome; and it is deserving of notice that the title 'Episcopus Partuensis,' the title given to Hippolytus by Prudentius, and that engraved on his statue, is still always given to one of the most eminent ecclesiastics of Rome. About 222 Hippolytus was engaged in strong opposition to Callistus, the Bishop of Rome, against whom in his great work he inveighs with the utmost severity. In 235, probably immediately after the death of Severus, in the persecution of Maximin the Thracian, he was banished with Pontianus to Sardinia. He appears however to have been permitted, perhaps soon after the election of Pontianus to the bishopric of Rome, to return to his see; but, probably on some new charge, he was eventually ordered to be put to death (about 236-8). The mode of his martyrdom has been variously stated, but the tradition referred to by Prudentius (who flourished 348-405), is that the tyrant, alluding to his name, directed that he should be, like Hippolytus of old, torn to pieces by horses, and that the heathen spectators hastened his death by stabbing him. His remains were removed to the church of St. Laurence, where Prudentius saw his sanctuary; and Bunsen conjectures that his statue, which was discovered on this site, was erected on the occasion of the solemn removal of his remains. The character of Hippolytus, as a writer and an ecclesiastic, is thus summed up by Bunsen ('Hippolytus and his Age,' 2nd ed., l. 272):—

"As a writer Hippolytus possesses neither the elegance of Origen nor the brilliant originality of Tertullian. His best style comes nearer to that of Clemens of Alexandria, but, unfortunately, he generally writes either in a very high-flown rhetorical style or in none at all. This is particularly the case with the Refutation. His Greek therefore, is not only tainted with Latinisms, but often (unless some of the worst passages are mere loose extracts) without any style in the construction of the sentences. These defects of style are very naturally the reflex of the defects of his intellect and character. His reasoning powers cannot be measured with the three men of genius among his contemporaries whom we have mentioned above. But it would be decidedly unjust to judge him either by his philological and metaphysical writings, or by his disputes with Callistus. To appreciate Hippolytus, to understand the epithets of 'most sweet,' and 'most benevolent,' applied to him by a contemporary of Chrysostom, and of 'most eloquent,' which is Jerome's expression; in short, to understand the unbounded admiration, and almost apostolic nimbus which surrounds his name in later ages, we must contemplate him as the serene, platonic thinker, with his wide heart for the universality of God's love to mankind in Christ, and with his glowing love of liberty, and of the free agency of man, as being the specific organ of the divine Spirit, and the only one congenial to the very nature of God. These are the really distinguishing features in his character. We find them particularly developed in the 'Confession of Faith,' which forms the elaborate peroration to the great work of his life."

The importance of a work professing to be a 'Refutation of all the Heresies' then prevalent (thirty-two being described and 'refuted'), and also the 'Confession of Faith,' or as Dr. Wordsworth prefers to call it, the 'Apology to the Heathen,' written by such a man, will be readily understood to be very great as bearing on the internal history of the Church of the early part of the 3rd century, and still more as setting forth the received doctrines of the Church at the same period—a century earlier than the Council of Nice, and a time of transition both in discipline and doctrine. As respects its theological sentiments the work of Hippolytus may be regarded as a strong defence of the Johannean doctrine of the Logos—or in other words of the orthodox view of the person of Christ.

The remaining writings of Hippolytus—those contained in the editions of Fabricius and Gallandus, and which are looked upon as authentic, though of some only fragments remain, are—'On Christ and Antichrist;' 'On the Gifts of the Holy Spirit;' 'Against the Heresy of Noetus;' 'The Little Labyrinth;' 'Against Vero;' the 'Canon Paschalis, a demonstration of the time of Easter;' &c.

The other Hippolyti, including Hippolytus a Roman senator and martyr, one distinguished as Hippolytus of Thebes, and one or two of lesser note, are now generally believed to be merely mythical personages.

HIRT, ALOYSIUS, was born at Bela near Donaueschingen in Baden, June 27, 1759. In early life he visited Italy and studied the remains of classic art there, and on his return settled at Berlin, having been appointed preceptor to Prince Henry of Prussia. In 1796 he became professor of architecture and the fine arts at the academy of Berlin, and was subsequently made professor of archaeology at the University of Berlin. Among his numerous publications are several special disquisitions on particular structures, such as the Temple of Solomon, the Temple of Diana at Ephesus, and the Pyramids of Egypt; but those by which he will be most generally and longest known are his 'Baukunst nach den Grundsätzen der Alten,' 1809, and his 'Geschichte der Baukunst bey den Alten,' 1821-27, 3 vols. 4to, with a folio atlas of plates. This last not only gives a history of ancient architecture, that of Egypt included, down to the time of Constantine, but also a full account of all the various classes of buildings. Latterly he was much occupied in arranging the collections

in the Berlin Museum, which brought him into a literary dispute with his former pupil and protégé, Dr. Waagen, since well known by his visits to England and his works on English art, and the art-collections of England. Hirt died at Berlin June 29, 1837, just two days after entering his seventy-eighth year.

HIRTIUS, AULUS, born of a patrician Roman family, applied early to the study of rhetoric, and became intimate with Cicero, who speaks highly of his oratorical talents. There is a letter of Hirtius to Cicero in 'Ep. ad Att.,' xv. 6. Hirtius served with distinction under Cæsar in the Gallic war. He is generally supposed to be the author of the eighth book of the 'Commentaries' (Suetonius, 'Life of Cæsar,' c. 56), as well as of the books of Cæsar's Alexandrian and African campaigns, which are avowedly written by the same person as the eighth book of the 'Commentaries.' With regard to the book 'De Bello Hispanico,' it appears to be written by a different and an inferior hand, and it has been attributed by some to C. Oppius, another friend of Cæsar. (Voassius, 'De Historicis Latinis.') Hirtius remained attached to Cæsar till his death, after which he took the part of the senate against Antony, and was named consul with C. Vibius Pansa. The two consuls had an engagement with Antony, whom they defeated near Mutina (Modena), B.C. 43, but Hirtius was killed in the battle.

* HITCHCOCK, EDWARD, D.D., LL.D., an eminent American geologist, was born at Deerfield, Massachusetts, United States, in May 1793. In 1816 he was made head of the Academy at Deerfield; but resigned that office in 1819, and two years later accepted the invitation to become the pastor of a congregational church at Conway in the same state. But his studies were directed to science still more than to theology, and Mr. Hitchcock sharing fully in the ardour which the study of geology was then everywhere exciting began to make himself known by his lithological investigations. In 1824 he published a work of some importance, 'The Geology of the Connecticut Valley,' which was received with much applause, and eventually led to his being offered in 1824-5 the professorship of Chemistry and Natural History in Amherst College. He continued in the zealous discharge of the duties of this office, and prosecuting his favourite studies, with the occasional publication of a scientific paper in the 'Memoirs of the American Academy,' or some other scientific journal, or in a monograph, such as his 'Catalogue of Plants within Twenty Miles of Amherst (1829),' until 1830, when he was appointed State Geologist, and called upon by the State of Massachusetts to make a survey of the geology and mineralogical resources, &c., of that state. The result of his explorations appeared in 1831 under the title of 'First Report on the Economic Geology of Massachusetts;' this was followed in 1833 by a more complete 'Report on the Geology, Botany, Zoology, &c., of Massachusetts,' with numerous plates and diagrams. This report was a work of great value, but the progress of the science having rendered it desirable that a re-examination of the geological character of the state should be made, Dr. Hitchcock was directed to undertake it. Having done so, he drew up in 1838 a 'Report on a Re-examination of the Geology of Massachusetts;' but his chief work on the subject embodying the results of his protracted course of investigations and matured study, and one likely long to remain the standard work of reference on this important portion of the United States, appeared in 1841 under the title 'Final Report on the Geology of Massachusetts,' 2 vols., royal 4to, with a map and numerous illustrations.

In 1844 Dr. Hitchcock was chosen president of Amherst College, which important office he still holds, together with that of professor of geology and natural theology. He had previous to this sought to extend the knowledge of general as well as of local geology by his 'Elementary Geology,' of which the first edition appeared in 1840, and which, having been reprinted in England with an 'Introductory Notice' by Dr. J. Pye Smith, became extremely popular in both countries, partly no doubt from the religious spirit pervading it, but which it well deserved on account of its scientific merits: an 8th edition has been recently issued. Another work of a somewhat similar kind subsequently published by Dr. Hitchcock bears the title 'Outline of the Geology of the Globe, and of the United States in particular.' In 1848 Dr. Hitchcock published an important monograph on the 'Fossil Footmarks in the United States,' chiefly an account of those in the Connecticut Valley, of which as early as 1842 Sir Charles Lyell says, that Dr. Hitchcock "had observed more than 2000 impressions in the district alluded to." Having been appointed by the state of Massachusetts in 1850 State Agricultural Commissioner, with directions to visit and examine the chief schools of agriculture in Europe, he on his return to America presented a valuable 'Report on the Agricultural Schools of Europe,' which will be found well worth consulting by any one interested in the subject.

Besides his numerous papers in the American scientific journals and the works above named, Dr. Hitchcock has written several books and pamphlets of a more or less directly theological character. Of these the chief are—'Religious Lectures on Peculiar Phenomena in the Four Lessons, delivered to the Students in Amherst College in 1845-49,' and 'The Religion of Geology and its connected Sciences,' 8vo, 1851. Dr. Hitchcock is held in high esteem by the scientific men of Europe as well as of America, and few men have done more to advance the study of geology in the United States, or to remove the prejudices which beset its culture.

*HITTORFF, JACQUES-IGNACE, architect, who has designed some of the chief buildings in Paris erected within a recent period, and who is the author of some standard books illustrative of classical architecture, was born at Cologne in the year 1798. His father, a passionate admirer of the architectural antiquities around him, devoted his son to the practice of an art for which the latter also manifested in his early years an inclination. Having received a good scientific and literary education, M. Hittorff's professional training was commenced at Cologne, where, as was customary, it included practical exercise in mason's work and bricklaying: he was thus occupied when about the age of fifteen years; and houses built from his drawings, whereat he was himself a workman, are still remaining. In 1810, at the age of seventeen, M. Hittorff arrived in Paris: here he pursued his studies with M. Bélanger, an architect of some repute, who was then engaged upon the construction of the *abattoir* Rochecouart, and the cupola constructed in iron of the Halle au Blé. In his academical studies in the School of Architecture, where he was under the guidance of Percier, he gained many medals. In 1818, after the death of Bélanger, he was named architect to the king, and charged with the direction of the fêtes and ceremonies at the court. Thus between 1819 and 1830, M. Hittorff, with his colleague M. Le Coite, executed the decorations in the church of St. Denis at the funerals of the Prince of Condé, the Duc de Berry, and the king Louis XVIII.; those in the church of Notre Dame at Paris for the marriage of the Duc de Berry, and for the baptism of the Duc de Bordeaux, of which illustrations were published by the authors; and those on the coronation of Charles X. at Reims. With the same architect he directed the works at the Théâtre-Italien (previously Salle-Favart), and the construction of the Théâtre de l'Ambigu-Comique, which showed the way to many contrivances in theatrical architecture and decoration. In the intervals of his duties, M. Hittorff pursued the study of ancient architecture. In 1820 and 1821 he studied the examples of architecture in England and Germany. During the years 1822 to 1824 he was able to visit Italy, and to carry out a project for the exploration of the remains in Sicily. To the latter object, in conjunction with his pupil M. Zanith, now architect to the King of Wurtemberg, and M. Stier, professor of architecture at Berlin, he devoted nearly a year, and the result was the possession of more than a thousand drawings, and the solution of difficulties in history—especially through the light which was thrown by the discoveries, upon the question of the application of external colouring to their buildings by the Greeks. From the materials thus collected, Messrs. Hittorff and Zanith published their two works—the one, the 'Architecture Moderne de la Sicile,' with 76 folio plates, Paris, 1835; and the other, the 'Architecture Antique de la Sicile,' which has reached to 48 plates, and which it is intended to continue to 150; and M. Hittorff published his recent and valuable work, 'Architecture Polychrome chez les Grecs,' &c., with 25 plates (Paris, 1851), where he gives a restoration of the temple of Empedocles at Selinus, coloured according to his matured conclusions as to the ancient practice. In 1830 M. Hittorff had published a translation from English of 'The Unedited Antiquities of Attica' of the Society of Dilettanti, which he enriched with new illustrations, designs for restorations, and many notes. M. Hittorff is also the author of many 'Mémoires' upon the ancient basilicas, Egyptian and antique metal work, the city of Pompeii, and ancient and modern arabesques, and of the articles on architecture in the 'Encyclopédie des Gens du Monde.'

Amongst the works which M. Hittorff has designed and superintended the construction of since the year 1833, may be named the following:—the arrangement of the Place de la Concorde (in which the obelisk of Luxor was placed), with the fountains, rostral columns, and other newly-designed embellishments; the five fountains of the Champs-Élysées; cafés, restaurants, small theatres, and guard-houses; the Panorama rotonda, commenced in October 1838, and opened to the public in May 1839; the present Cirque-de-l'Impératrice, which was commenced at the end of 1839 and opened eight months afterwards; the Cirque-Napoléon, commenced in April 1851 and opened in December of the same year; the new disposition in 1855 of the Place-de-l'Étoile; the Avenue-de-l'Impératrice, and the Bois-de-Boulogne. The two circuses—the one last named on the Boulevard-des-Filles-du-Calvaire, and the other in the Champs-Élysées—are of like dimensions; and in all, three circular structures have been completed by M. Hittorff, each having a diameter of 124 French feet, and answering the conditions of having the smallest possible area of points of support. At the Panorama, where the admission of light entailed great difficulty, the roof, having a span equal to that of the Pantheon at Rome, was sustained without any actual internal support, on the suspension-bridge principle, by means of twelve cables, which were formed of iron wire. At the Cirque-de-l'Impératrice, where a pentagonal plan was adopted, he designed a central portion of the roof, having a diameter of about 100 French feet, to be supported upon sixteen small iron columns, and so executed it, though without the authority of the Conseil des Bâtimens, by whom it was feared that the thrust of the roof would endanger the stability, and who required the introduction of ties. In the Cirque-Napoléon the whole area was covered by a conical roof without ties, standing on twenty points of support. These buildings have excited great interest in England, the Continent, and America; and illustrations of them

have been published in several forms. M. Hittorff's most important work however is perhaps the church of St. Vincent-de-Paul. In this he was at first joined with his father-in-law, the late M. Le Père, an architect who was associated with Gondouin in the erection of the column of the Place-Vendôme, and had contributed to the great French work on Egypt some of its best illustrations. At the church alluded to, although the restraints upon the architect prevented his completing the exterior as designed, in the interior a grand impression is produced by the proportions of the colonnades, the carpentry of the roof, the hemicycle, the organ, the ornaments, and the magnificent coloured decoration of the walls and stained glass. The architect has applied the knowledge of ancient monuments, and added all the results of modern artistic processes and industry; and the work has earned high praise from all parts of Europe, Italy included. M. Hittorff's other works include the Mairie of the 12th arrondissement, built between 1848 and 1851; the École-Communale, in the Rue-des-Prêtres-St.-Germain-l'Auxerrois (1852-54); the building near the Barrière-du-Trône, for an institution founded by the empress for the education of 300 young girls (1854-56); and, in conjunction with other architects, the vast Hôtel-du-Louvre, the works of which, involving an outlay of 12 millions of francs and an enormous amount of contrivance in details, were completed within the space of a year. More recently M. Hittorff has been charged with a project for some important public buildings estimated to cost 2½ millions of francs, proposed to be erected opposite the Louvre. In the autumn of 1856 however he started on a fresh visit to Italy, with a view to the completion of his work on ancient architecture. During the course of an honourable and active career, he has prepared, besides the works which have been named, many designs for theatres, museums, houses, sepulchral chapels, and tombs, at requisitions sent to him from all parts of Germany and France. He has been attached as architect to the government of France and the city of Paris, is a member of the Institute of France, and has been elected in the academies of Berlin, Munich, Vienna, and Milan, and the National Institute of Washington, and is a corresponding member of the Institute of British Architects; he is an officer of the Prussian order of merit, and of other foreign orders, and was most worthily selected by the Institute of British Architects to be the recipient of the royal medal—being the third foreigner upon whom that distinguished honour had been conferred.

HOADLEY, BENJAMIN, an English clergyman, successively bishop of Bangor, Hereford, Salisbury, and Winchester, was born in 1670, at Westerham in Kent. In a general view of Bishop Hoadley's character, and his relation to the times in which he lived, he is to be regarded, 1st, as a principal writer among the divines of the English Church (of whom there were many in the 18th century) who are called Rational, that is, who have renounced the whole of what constitutes proper Calvinism, and have advanced more or less near to the opinions which are comprehended under the term Unitarianism. Hoadley's 'Plain Account of the Sacrament,' and still more his 'Discourses on the Terms of Acceptance,' show how 'rational' was the view which he took of Christianity, its requirements, and its ordinances. These works are still much read, and greatly valued by those who coincide in his opinions, whether in or out of the Establishment. 2. He is to be regarded as the great advocate of what are called Low Church principles, a species of Whiggism in ecclesiastics, in opposition to the high pretensions sometimes advanced by the church or particular churchmen. It was in this character that he wrote his treatise on the 'Measure of Obedience to the Civil Magistrate,' which was animadverted upon by Bishop Atterbury [ATTERBURY, FRANCIS], and defended by Hoadley, whose conduct on this occasion so pleased the House of Commons that they represented in an address to Queen Anne what signal service he had done to the cause of civil and religious liberty. But he was engaged more earnestly in defence of those principles when, being then bishop of Bangor, he printed a sermon from the text, "My kingdom is not of this world," concerning the true nature of that kingdom which Christ came to establish on earth, the principles of which were attacked by various persons. It was out of this sermon that the celebrated Bangorian controversy arose, one of the most remarkable in the history of the Protestant Church of England. The doctrines of Hoadley being vehemently opposed by the Lower House of Convocation, excited such violent discussions in that body that the government in order to prevent further dissensions suddenly prorogued the Convocation, and the Houses of Convocation have never since been permitted to meet for the despatch of business.

In the reigns of the first and second Georges, divines of the school to which Hoadley belonged found favour at court. It was otherwise in the reign of George III. The succession of Hoadley's preferences with the dates follows. In early life he was a city clergyman, having the rectory of St. Peter le Poor, with the rectorship of St. Mildred in the Poultry. In 1710, when the Tory influence was becoming predominant in the councils of Queen Anne, a private patron, Mrs. Howland, of Streatham, who was connected with the noble house of Russell, presented him with the rectory of Streatham. The queen died in 1714, and the accession of King George I. brought with it a great change in the politics of the court; one of the first bishoprics that fell vacant, which was that of Bangor, was presented to him. In 1721 he was translated to Hereford, and thence in 1728 to Salisbury. In 1734 he was made Bishop of Winchester. He died in 1761.

A full account of Bishop Hoadley, with the particulars of an extraordinary attempt at imposition upon him in his old age, in an affair of money, by a foreigner to whom he had shown great favour, detected and exposed by him with a vigour which is rarely found in persons at the age of eighty, may be read in the 'Biographia Britannica.'

HOADLEY, BENJAMIN, M.D., eldest son of Bishop Hoadley, was born February 10th 1705 in London. He was admitted of Corpus Christi College, Cambridge, April 8th 1722, and received his degree of M.D. in 1729. In June 1742 he was appointed physician to his Majesty's household, and in January 1746 was appointed physician to the household of Frederick, prince of Wales, and he held both offices at the same time. He was the author of 'Three Letters on the Organs of Respiration,' read at the Royal College of Physicians, London, 1737, being the Gulstonian Lectures for that year; 'Oratio Anniversaria in Theatro Col. Medicor. ex Harveii instituta, habita die 18mo, Oct. 1742;' and 'Observations on a Series of Electrical Experiments,' 4to, 1756. Dr. Hoadley is now known chiefly as the author of 'The Suspicious Husband,' 1747, a bustling comedy, full of incidents of intrigue, in which Garrick was distinguished for his performance of the character of Ranger, as Elliston was also in more recent times. Dr. Hoadley died August 10th, 1757, in his house at Chelsea.

His brother, the Rev. JOHN HOADLEY, LL.D., born October 8th, 1711, died March 16th, 1776, was the bishop's youngest son. He was the author of several poems in Dodsley's 'Collection,' and of five dramatic pieces which are now forgotten. He published an edition of Bishop Hoadley's works, 3 vols. folio, London, 1778.

HOARE, SIR RICHARD COLT, BART., the historian of Wiltshire, and an eminent biographer and antiquary, was born on the 9th of December 1758. His father, the first baronet, was married to Anne, second daughter of Henry Hoare, Esq., and of Susanna, daughter and heiress of Stephen Colt, Esq. In a very pleasing autobiography which Sir R. Colt Hoare drew up in his old age, he says:—"In my youth I was initiated in the business of our family bank (Messrs. Hoare's bank, Fleet Street, London), till my grandfather removed me from it, and gave up to me during his lifetime all his landed property. An early habit of application to business induced me to have recourse to the pen and pencil, for, without some amusement, life ultimately must produce tedium and ennui; and, thanks to Providence, I used in my advanced age to feel the benefits of the early habits of application." In 1783 he married the eldest daughter of Lord Lyttleton, who died in 1785, leaving one child, Henry. In 1787 he succeeded to the baronetcy. After the death of his wife he made an extensive tour on the Continent, which occupied him nearly two years; and in 1788 he again left England on a continental tour, and did not return until August 1791. He devoted ample time to the examination of interesting objects, and filled his portfolio with valuable drawings. For the gratification of his family and friends he printed an account of his travels in four volumes. They were subsequently condensed, and published in 1813 in 2 vols. 8vo, under the title of 'A Classical Tour through Italy and Sicily; tending to illustrate some districts which have not been described by Mr. Eustace in his Classical Tour.' When the greater part of the Continent had become closed in consequence of the war, Sir Richard travelled through his own country, and he began with Wales; "but, as travelling without a pursuit becomes tedious, I resolved," he says, "to take Giraldus as my guide." In 1806 he published a translation of Giraldus, with views, annotations, and a life of Giraldus, in two splendid quarto volumes. He furnished the drawings for the description of Monmouthshire by Archdeacon Coxe. In 1807 he visited Ireland, and published a short account of his excursion. But it is as the historian of Wiltshire, his native county, that Sir R. Colt Hoare's fame as a topographer and antiquarian is best established. The first volume of South Wiltshire is confined to British antiquities, and includes Stonehenge. The second volume commences with North Wiltshire, and Part I. is devoted to the British Period and contains the account of Avebury. Part II. comprises the Roman Period. These two elaborate volumes were followed in 1821 by the history of Modern Wiltshire. In the description of several of the hundreds he had a coadjutor for each, but the difficulty of obtaining aid of this kind at length compelled him to confine his attention to South Wiltshire. He died on the 19th of May 1838. A catalogue of works printed for private circulation by Sir R. Colt Hoare is given in the 'Gentleman's Magazine' for July 1838, which also contains a list of his communications to the Royal Society of Antiquaries.

HOARE, WILLIAM, R.A., an historical and portrait painter, born at Bath about the year 1706. He studied at Rome nine years, where he was the fellow-pupil of Pompeo Batoni, under Francesco Fernandi, called D'Imperiali. Upon his return to England he established himself at his native place, where he acquired a great reputation as a portrait-painter in oils and crayons; he painted also some historical pieces. There is an altar-piece by Hoare, of 'Christ bearing the Cross,' in the church of St. Michael at Bath; and another of the 'Lame Man healed at the Pool of Bethesda,' in the Octagon Chapel. He was one of the original members of the Royal Academy, and sent several works to its early exhibitions. He died at Bath in 1792.

HOARE, PRINCE, who succeeded Boswell as foreign secretary to the Royal Academy, was the eldest son of William Hoare, R.A., and was born in 1754. He was professionally a painter, and is known as the author of about twenty dramatic pieces, among which are 'No Song

no Supper,' 'Look and Key,' 'My Grandmother,' and other lively farces; and he published in 1806 'An Inquiry into the Requisite Cultivation and Present State of the Arts of Design in England.' Prince Hoare presented the so-called 'Slaughter of the Innocents,' by Raffaele, to the Foundling Hospital, which institution has lent it to the National Gallery; it is however only a part of a composition, and has been so completely painted and varnished over that, if originally by Raffaele, now little of Raffaele remains but the composition, which is very inferior to Raffaele's more important works. Prince Hoare died at Brighton in 1834, aged eighty.

HOBBES, THOMAS, was born at Malmesbury, in Wiltshire, on the 5th of April 1588, and was the son of a clergyman of that town. At the age of fifteen he was sent to Magdalen Hall, Oxford; and after he had gone through the usual university course, he became in 1608 private tutor in the family of Lord Hardwicke, soon afterwards created Earl of Devonshire. In 1610 he went abroad with his pupil, Lord Cavendish, and made the tour of France and Italy. After his return he came to mix much, chiefly through the assistance of his patron the Earl of Devonshire, with the men most distinguished at that time for learning, as well as with others conspicuous by their high station. He enjoyed the familiar friendship of Bacon, who is said to have been assisted by Hobbes in the translation of some of his works into Latin, and was an intimate associate also of Lord Herbert of Chisbury, and of Ben Jonson. Ben Jonson revised for Hobbes his first work, the translation of Thucydides.

This translation, which had been begun, as Hobbes himself tells us, "with an honest view of preventing, if possible, those disturbances in which he was apprehensive his country would be involved, by showing, in the history of the Peloponnesian war, the fatal consequences of intestine troubles," was published in 1628. His patron, the Earl of Devonshire, had died two years before; and the son, Hobbes's pupil, died in the year in which this translation was published. He was so much affected by this loss that he gladly seized an opportunity of going abroad with the son of Sir Gervase Clifton, with whom he remained some time in France. He returned in 1631, at the instance of the Dowager-Countess of Devonshire, to undertake the education of the young earl, who was then only thirteen. In 1634 he went with his new pupil first to Paris, where he enjoyed the friendship and frequent society of Father Mersenne, and applied himself much to the study of natural philosophy, and afterwards to Italy, where he became known to Galileo. He returned to England in 1637. Shortly afterwards he applied himself to the composition of his 'Elementa Philosophica de Cive,' a few copies of which were printed at Paris in 1642. A second edition of the work was printed in Holland in 1647, under the superintendance of M. Sorbière, to which were prefixed two laudatory letters addressed to the editor, the one by Gassendi and the other by Mersenne.

Shortly after the meeting of the Long Parliament, which took place in the end of the year 1640, Hobbes had withdrawn himself to Paris. He became acquainted there with Descartes, with whom he afterwards held a correspondence on mathematical subjects; and he also acquired the friendship of Gassendi.

In 1647 Hobbes was appointed mathematical tutor to the Prince of Wales, afterwards Charles II.; and he so won the esteem and affection of the prince, that though, after the publication of the 'Leviathan,' Charles, yielding to the opinions of divines, forbade him his presence, he yet always spoke of him in terms of the greatest kindness, kept his picture, taken expressly for the purpose, in his study, and when he had been restored to the throne, unasked presented him with a pension.

Hobbes's two small treatises, entitled 'Human Nature' and 'De Corpore Politico,' were published in London in 1650, and in the following year the 'Leviathan.' He caused a copy of this last work to be fairly written out on vellum, and presented to Charles II.; but the king, having been informed by some divines that it contained principles subversive both of religion and civil government, thought it right to withdraw his favour from Hobbes, and, as has been already said, forbade him his presence.

After the publication of the 'Leviathan,' Hobbes returned to England. In 1654 he published his 'Letter upon Liberty and Necessity,' which led to a long controversy with Bishop Bramhall [BRAMHALL]; and it was about this time too that he began a controversy with Dr. Wallis [WALLIS, JOHN], the mathematical professor at Oxford, which lasted until Hobbes's death. By this last controversy he got no honour.

Almost immediately after Charles's restoration in 1660, a pension of 100*l.* a year was settled upon Hobbes out of the privy purse; but this mark of favour from the king had by no means the effect of removing the obloquy under which Hobbes and his opinions laboured, and in 1666 his 'Leviathan' and 'De Cive' were censured by parliament. Shortly after Hobbes was still further alarmed by the introduction of a bill into the House of Commons for the punishing of atheism and profaneness; but this storm blew over, and, as is usually the case, the notoriety attending the obloquy under which Hobbes laboured had its sweets as well as its bitterns. In the year 1669 he received a visit from Cosmo de' Medici, then prince and afterwards duke of Tuscany, who honoured him with many presents, and asked in return for his picture and a complete collection of his writings, the former of which he afterwards deposited among his curiosities, and the latter in his

library at Florence. He received many similar visits from foreigners of distinction, all of whom were curious to see one whose name and opinions were known throughout Europe.

In 1672 Hobbes wrote his own life in Latin verse, being then in his eighty-fifth year; and in 1675 he published his translation in verse of the Iliad and Odyssey. He had previously, by way of feeler, published four books of the Odyssey; and the reception which they had met with had encouraged him to undertake the whole. But however favourable might have been the reception at the time, the popularity of this translation has certainly long since ceased; it is wholly wanting in Homeric fire, bald and vulgar in style and diction; and it must be allowed that the fame of the philosopher is anything but heightened by his efforts as a poet. Hobbes had now retired to the Earl of Devonshire's seats, Chatsworth and Hardwicke, in Derbyshire; but notwithstanding his advanced age, he still continued to write and publish. His 'Dispute with Laney, bishop of Ely, concerning Liberty and Necessity,' appeared in 1676; and in 1678 his 'Decameron Physiologium, or Ten Dialogues of Natural Philosophy;' to which was added, a book entitled 'A Dialogue between a Philosopher and a Student of the Common Law of England.' In 1679 he sent his 'Behemoth, or a History of the Civil Wars from 1640 to 1660' to a bookseller, with a letter in which he requested him not to publish it until a fitting occasion offered. It appears from this letter that Hobbes, being anxious to publish the book some time before, had with that view shown it to the king, who refused his permission; and for this reason Hobbes would not now allow the bookseller to publish it. It appeared however almost immediately after Hobbes's death, which took place on the 4th of December 1679, when he was in his ninety-second year. The immediate cause of his death was a paralytic stroke.

The quality which chiefly strikes us, in contemplating the personal character of Hobbes, is its independence. Placed during the greater part of his life in circumstances which would have made any other man, despite himself, a courtier—the inmate of a noble house and tutor to a king,—amid the temptations of society he steadily pursued philosophy, and at the risk of losing great friends, and indeed with the actual sacrifice of royal favour, constantly put forth and clung to opinions which were then most startling and obnoxious. His independence in smaller things may be gathered from the following account of his daily mode of life in the Earl of Devonshire's house, which is given by Dr. Kennet in his 'Memoirs of the Cavendish Family,' and which is interesting if only because it relates to so remarkable a man as Hobbes. "His professed rule of health was to dedicate the morning to his exercise, and the afternoon to his studies. At his first rising therefore he walked out and climbed any hill within his reach; or, if the weather was not dry, he fatigued himself within doors by some exercise or other, to be a sweat. . . . After this he took a comfortable breakfast; and then went round the lodgings to wait upon the earl, the countess, and the children, and any considerable strangers, paying some short addresses to all of them. He kept these rounds till about twelve o'clock, when he had a little dinner provided for him, which he ate always by himself without ceremony. Soon after dinner he retired to his study, and had his candle with ten or twelve pipes of tobacco laid by him; then shutting his door, he fell to smoking, thinking, and writing for several hours." We are told that he was testy and peevish in conversation, more particularly in his latter years, and that he did not easily brook contradiction. And there can be no doubt that his independence was often displayed in that excess in which it takes the name of arrogance. It was one of his boasts, for instance, "that though physics were a new science, yet civil philosophy was still newer, since it could not be styled older than his book 'De Cive.'" Such indeed was his usual tone in speaking of his own performances. Another proof of his arrogance is supplied by his mathematical controversies. But after all there is something that we cannot resist admiring in independence of others' opinions, when carried even to the excess in which Hobbes's character displays it. If we leave out of account his arrogance, Hobbes seems to have been a man of much amiability, as well as strength of character.

Turning from the man to the author, we must content ourselves with very few words on a subject worthy of a volume. For Hobbes is indeed, as Mr. Mill remarks, "a great name in philosophy, on account both of the value of what he taught and the extraordinary impulse which he communicated to the spirit of free inquiry in Europe." ('Fragment on Mackintosh,' p. 19.) He may be considered the father of English psychology, as well as (what every one must allow him to be) the first great English writer on the science of government. Let it be remarked also (for it is from losing sight of this that some of the most important misconceptions of Hobbes's views have arisen) that though he wrote on psychology, and much of his fame is as a psychologist, his psychology, like that of Bentham, was only auxiliary and in the way of prelude to his writings on government, and he should always emphatically be viewed as a writer on government. And even were his psychology left entirely out of account, his writings on government, of which the 'Leviathan,' the 'De Cive,' and the small treatise 'De Corpore Politico,' are the chief, would be a sufficient passport to immortal fame.

The views of Hobbes on government, as contained in his political

treatises, may be thus briefly stated. He views government as a refuge, dictated by reason or the law of nature, from the evils of a state of nature, which he chooses to call (and this one would think was a matter of small import, though, strange to say, it has ever been one of the chief charges brought against Hobbes) a "state of war." The government thus recommended is formed (he imagines) by a covenant or contract entered into between those who are to be subjects and those who are to be rulers, and ever after tacitly adopted by all future sets of subjects and future sets of rulers. And the subjects having covenanted complete unconditional obedience to their rulers, and the duty of obedience being directly referred to this covenant, Hobbes views obedience as a religious duty, and the supremacy of the rulers, on the other hand, as a divine right. As regards forms of government, he prefers, on account of its greater vigour and aptitude for business, a monarchy; but he strongly and zealously inculcates at the same time the necessity of a sound education of the people. But whatever be the form of government, he contends that the government must be possessed of supreme powers, else it would not be the government. And being himself in favour of a government of one, or a monarchy, he ever insists on the supremacy of the monarch and on the duty of unconditional obedience to his laws. Thus it is that the decriers of Hobbes, losing sight of his views on the education of the people, and confounding monarchy with tyranny, and supreme with arbitrary power, have nicknamed him "the apologist of tyranny." And because, carrying out his views as to the supremacy of government, he has required submission to the mode of faith which the monarch establishes, and, writing not on moral but on political science, has chosen to define the words 'just' and 'unjust' with a direct reference to the laws which the monarch ordains, and which it is the duty of the subjects to obey, he has been denounced as contemning religion, and as a confounder of moral distinctions. But Hobbes does not take upon himself to say that the monarch's opinion is the test either of true religion or true morals; and indeed, in many parts of his works distinctly asserts the pre-eminent merits of one form of faith and the independence of morality, which is, as it should be, his criterion of the goodness of law. According to Hobbes, what is established by law must be obeyed; but there is nothing in his views to prevent attempts which are conformable with the laws to alter what in the laws is wrong.

There is no doubt that in Hobbes's views, as we have stated them, there is some error. His hypothesis of a covenant as the origin of government, for instance, is a fiction which has now long been exploded in this country. But this is an error solely speculative, and of little importance; for all the valuable conclusions which Hobbes seeks to derive from his fiction may be got at, without its aid, by means, for instance, of the principle of utility. As to the grave charges which have been so sedulously brought against Hobbes, from the first appearance of his works to the present time, they have no other foundation than ignorance and prejudice.

The number of works to which Hobbes's writings gave rise is very great. "The Philosopher of Malmesbury," says Dr. Warburton, "was the terror of the last age, as Tindal and Collins are of this. The press sweat with controversy, and every young churchman-militant would try his arms in thundering on Hobbes's steel cap." ('Divine Legation,' vol. ii. p. 9, Preface.) His principal antagonists were—Clarendon, in a work named 'A Brief View of the Dangerous and Pernicious Errors to Church and State in Mr. Hobbes's book entitled Leviathan;' Cudworth, in his treatise on 'Eternal and Immutable Morality;' and Bishop Cumberland, in his Latin work on the 'Laws of Nature.' Bishop Bramhall published a book called 'The Catching of the Leviathan,' to which Hobbes replied. We may also mention Archbishop Tenison's 'Creed of Mr. Hobbes examined,' and Dr. Eachard's 'Dialogues on Hobbes.' And, in addition to direct and professed attacks on Hobbes, there are numerous references to his views for the purpose of censure in Harrington's 'Oceana,' and in Henry More's writings.

Until recently there was no complete edition of even the English writings of the 'Philosopher of Malmesbury.' But this want has been well supplied by the handsome edition published at the cost and under the superintendance of the late Sir William Molesworth, under the title of 'The English Works of Thomas Hobbes of Malmesbury, now first collected and edited by Sir William Molesworth, Bart.,' 16 vols. 8vo.

HOBBIMA, MINDERHOUT, one of the most eminent of the Flemish landscape painters, was born at Antwerp, as is supposed about the year 1611. It is not known by whom he was instructed, but his works evince the most assiduous and successful study of nature. His subjects are in general simple country scenes, the slope of a hill with shrubs and trees, the borders of a forest, a winding path leading to a distant village, or to some ruin, building, or piece of water, often carrying the eye to an almost evanescent distance; such are the materials to which, by accurate perspective, clearness, and fullness of colour, and the most careful execution, with a free and light pencil, he gives an unrivalled charm. His works are scarce and eagerly sought after. Some of his very finest productions are in England, in Sir R. Peel's collection, and the Grosvenor Gallery. The largest and, in the opinion of Dr. Waagen, the finest of his works is in the possession of Lord Hatherton, who has refused 3000*l.* for it. The National Gallery

does not contain a single picture by Hobbins, but there are some, though not among the best, of his works in the gallery at Dulwich.

HOICHE, LAZARE, born in 1768 near Versailles, of very humble parentage, enlisted in the French Guards at the age of sixteen. When the Revolution broke out he warmly espoused its cause, obtained a lieutenant's commission in a regiment of the line, and served in Flanders under Dumouriez. Having distinguished himself he was rapidly promoted, and at the age of twenty-four was made general in command of the army of the Moselle. He opened the campaign by attacking the Duke of Brunswick, in which however he failed. In concert with Pichegru he then attacked the Austrian army under Wurmsler, and drove it out of Alsace. Upon incurring the displeasure of St. Just, the terrorist commissioner of the Convention, he was arrested and thrown into prison at Paris, when his life was saved by the overthrow of Robespierre in July 1794. The Convention restored him to his rank, and sent him against the insurgents of La Vendée, where he showed much firmness mixed with considerable address and a disposition to conciliate, instead of driving the royalists to despair: he defeated the emigrants who had landed at Quiberon in July 1795, and having obliged them to surrender, he wrote to the Convention advising that the leaders only should be punished, and the rest be spared; but the Convention ordered a general massacre. Hoiche upon this gave up the command of that district to General Lemoine, and withdrawing to the south of the Loire, continued his operations in Vendée Proper, where he succeeded in putting down the insurrection, and seizing Charette and the other leaders, who were put to death. By a decree of the Directory, July 1796, he was declared to have well deserved of his country.

Hoiche now conceived the idea of effecting a landing in Ireland, and a fleet having been equipped at Brest with great secrecy, he embarked his troops in December 1796, but being separated by a storm from the rest of the fleet, he was obliged to return to France without effecting anything.

Upon the Directory giving him the command of the army of Sambre-et-Meuse, he crossed the Rhine near Neuwied, in presence of an Austrian army, defeated the Austrians in several battles, and advanced as far as Wetzlar, where he heard of the truce of Leoben, concluded between Bonaparte and the Archduke Charles, which put a stop to hostilities. In the quarrel which was then beginning to manifest itself between the Directory and the Legislative Councils, Hoiche took the part of the Executive, and he began to direct some of his forces towards Paris in order to support the Directory in the measures which it contemplated. For this he was denounced by the councils, and Bonaparte meantime having offered the support of his own army of Italy, the Directory declined Hoiche's services, and made use of Augereau to effect the coup d'état of Fructidor. [AUGEREAU.] Hoiche seems to have taken to heart this slight of the Directory, and he returned to his head-quarters at Wetzlar, where he was seized by a sudden illness, of which he died on the 15th of September 1797. The symptoms of the disease give rise to suspicions of poison. His remains were removed to Paris with great pomp, and his funeral was celebrated in the Champ de Mars with great magnificence. His life has been written by Rousselin, in 2 vols. 8vo.

HODGES, WILLIAM, R.A., was born in London about the year 1744. His father was a blacksmith, and kept a shop in St. James's Market. He attended Shipley's drawing school when very young, and became afterwards the pupil of Wilson the landscape-painter. He painted decorations for theatres, landscapes, and architectural views; among the latter a view of the interior of the Pantheon, Oxford-street, which was burnt down on January 14th, 1792.

In 1772 Hodges accompanied Captain Cook as draftsman on his second voyage to the South Seas; and his drawings were published in Cook's narrative. After the completion of this work he went to India, where, under the patronage of Warren Hastings, he realised a considerable fortune, and returned to London in 1784. About 1790 he made a tour on the continent of Europe, visiting Russia; and he exhibited a view of St. Petersburg at the Royal Academy in 1793. In 1795, finding that his Indian fortune was diminishing instead of increasing, he established a bank at Dartmouth in Devonshire, which however broke two years afterwards in consequence of the devastations of the French in Newfoundland. The shock brought on the death of Hodges on the 6th of March; and his wife (his third) died a few months afterwards. He was elected a member of the Royal Academy in 1787.

Hodges was not a painter of great ability; in style he imitated Wilson, but with little success. His best works are—a view of Windsor from the great park, and three or four views painted in India. He painted also two or three historical pieces for Boydell's Shakspeare. His last works were two ordinary landscapes illustrating the effects of peace and war, which he exhibited with twenty-three others, one of which was a large view of Falconet's equestrian statue of Peter the Great at St. Petersburg, in Old Bond-street; one of his companion pictures was a seaport in prosperity, the other was the same view devastated by fire and sword. These two pictures, which have been engraved, are now in Sir John Soane's museum. Several of the works of Hodges have been engraved; he himself executed a set of Indian views in aquatinta, which he dedicated to the East India Company. He published also an account of his travels in India, with plates.

* HODGKINSON, EATON, Professor of the Mechanics of Engineering in University College, London, is an European authority upon the properties of iron, cast or wrought, with regard to its application in architecture and engineering. He was born at Anderton, near Northwich, in Cheshire, on the 26th of February 1789. Having lost his father early, his mother sent him to the grammar school at Northwich, intending that eventually he should enter the church. Her small patrimony however compelled her to abandon the idea of sending him to Cambridge; and she removed to Manchester, where she entered into a business, in which she was assisted by her son, who was then about the age of twenty-one. The nature of the employment however was not agreeable to Mr. Hodgkinson, whose education had been advanced in Hebrew and other languages, and who was becoming attached to mathematical studies. These last he pursued further, finding himself in a place where mechanism and ingenuity abounded, but where additional science seemed to be not unneeded. Knowledge of the strength of materials was at that time defective; and especial difficulty attended the use of cast-iron. Before the period of Mr. Hodgkinson's researches, the chief authority on the subject of iron beams was Tredgold, who reasoned on the supposition that, when subject to cross-strain, a body resisted the force of compression along the top, and that of extension along the bottom, equally; and who therefore devised a sectional form like the letter **I**. Mr. Hodgkinson however showed that cast-iron and all crystalline bodies resist a crushing force far more effectually than they do a force tending to tear them asunder, and has thus established the fact that the form of the letter **T** inverted (**I**), with a bottom flange about six times as large as the top one, constitutes the most economical disposition of the material—the gain of strength being two-fifths or upwards. The earliest application of the discovery in a railway bridge, was about 1830, at Water-street, Manchester, for the Manchester and Liverpool line, by the late George Stephenson.

Mr. Hodgkinson's researches have also seriously invalidated the assumption of Tredgold, Moseley, Navier, and many others, that all 'rigid' bodies are elastic up to a certain degree of strain, at least; for, cast-iron, and some other bodies, as stone, he has found are never absolutely elastic,—their defects of elasticity varying nearly as the squares of the weights laid on, or of the changes of form produced.—With reference to the strength of pillars, the profound researches of Euler had been of little value to practical men. Euler's theory depended upon the force necessary to produce incipient bending in a pillar loaded at the top; but failing to discover regularity in that force, Mr. Hodgkinson sought for that necessary to break the pillar. This proved to be regular. His experiments in this enquiry (which were 227 in number) established some remarkable facts, such as the diminution of strength by adding to the height of the pillar above a certain point—though with the same load, and the same vertical pressure; that a pillar with two rounded ends is only one-third of the strength of a pillar with the ends flat; and that increase of strength results from thickening the column in the middle. From these experiments Mr. Hodgkinson deduced *formule* for solid and hollow pillars, which have been adopted in England and on the Continent; and have been expanded into tables for ready reference by architects. His researches last referred to were communicated to the Royal Society, and printed in the 'Philosophical Transactions' in 1840, under the title 'Experimental Researches on the Strength of Pillars of Cast-Iron, and of other Materials,' and for his efforts he had the honour of receiving the Royal Gold Medal, and was elected a fellow of the Society. These and his earlier researches on the strength of materials were at the expense of Mr. Fairbairn of Manchester, whose own investigations he greatly assisted; and some were aided by grants from the British Association for the Advancement of Science, and with his later experiments yet to be referred to, have probably involved an expenditure of 10,000*l*. In the researches for the Association he was in some instances named contemporaneously with Mr. Fairbairn for the same subjects [FAIRBAIRN, WILLIAM], as in determining the relative values of hot and cold blast iron. ('Reports of the British Association for the Advancement of Science,' vol. vi.)

When Mr. Stephenson conceived the idea of constructing the Britannia Bridge in the form of a wrought-iron tube, he applied, as Mr. Hodgkinson states, first to Mr. Fairbairn, and then through Mr. Fairbairn to Mr. Hodgkinson himself, in order that the necessary data might be got together for so novel an application of material. Mr. Hodgkinson had been consulted privately from near the origin of the scheme; but in 1845 he assisted in experiments at Mr. Fairbairn's works at Millwall, London; and subsequently he was engaged in the most important duties of experiment and calculation, from which resulted the determination of the proportions and structure of that which is perhaps the most remarkable effort in engineering science of modern times. For his co-operation in this work, he received a first class medal at the Paris exhibition in 1855.

In August 1847—on the issue of a Royal Commission to inquire into the application of iron to railway structures, consequent upon the accident at the Dee Bridge, Chester—Mr. Hodgkinson was named a member; and, in the form of Appendices to their report of July 1849, are 180 pages giving the results of experiments made by him for the Commission and for the Britannia Bridge. For the

"remarkable series" for the Commission, he deservedly received thanks for the "zeal and intelligence" with which the experiments were carried out.

The records of these numerous and valuable investigations are to be found interspersed through the 'Transactions' of the British Association for the Advancement of Science, and of the Literary and Philosophical Society of Manchester, of which last society Mr. Hodgkinson was for some time president, and in other publications which have been referred to; but the nature of his discoveries may also be gathered from the edition of 'Tredgold on the Strength of Cast-Iron and other Metals,' which he edited, adding a supplementary volume. This edition bears date 1842-46; and subsequent to that, the experiments for the Britannia and Conway bridges demonstrated the remarkable fact of the opposite character of wrought- to cast-iron, as to the capability to resist the relative forces of tension and compression, and showed the value of the cellular top in a tubular beam. Amongst his writings, one of his earliest, 'On the Transverse Strain and Strength of Materials,' will be found in the fourth volume of the 'Memoirs of the Manchester Society' (second series, 1822), in which he put forth his views in opposition to those which were general amongst scientific men as to the situation of the neutral line in a bent body. In the fifth volume of the same 'Memoirs' (1831) are five papers by him, namely, 'On the Forms of the Catenary in Suspension Bridges,' of which an abstract was given by the Rev. Dr. Whewell in his 'Analytical Statics' (Cambridge, 1833), and an amplification by the Rev. Canon Moseley in his 'Mechanical Principles of Engineering,' &c.; 'On the Chain-Bridge at Broughton, Manchester, with an Account of its Failure' (two papers); and one on the subject of the strength and form of iron-beams. The fourth report of the British Association contains the result of an extensive series of experiments 'On the Collision of Imperfectly-Elastic Bodies,' and the fifth report a paper 'On Impact upon Beams.'

Mr. Hodgkinson in 1856 was engaged in pursuing various researches, at the expense of the Royal Society and of Mr. Robert Stephenson. He has been elected an honorary member of the chief societies connected with architecture and engineering, and his discoveries have excited the highest interest on the Continent.

HODY, HUMPHRY, D.D., an eminent divine, was born on the 1st of January 1659, at Oldcombe, in Somersetshire. He was educated at the University of Oxford, took his degree of M.A. in 1682, and was elected in 1684 a fellow of Wadham College. In the same year he published a 'Dissertatio contra Historiam Aristæ de LXX. Interpretibus,' which was well received by most of his learned contemporaries. Vossius however published a reply to it in an appendix to his edition of 'Pomponius Mela.' But the works by which Hody was principally known among his contemporaries were those which he published respecting the bishops who had been deprived of their bishoprics during the reign of William and Mary, for refusing to take the oath of allegiance to the new government. The first work which he published on this subject was a translation of a Greek treatise, supposed to have been written by Nicephorus in the latter end of the 13th or the beginning of the 14th century, in which the writer maintains that "although a bishop was unjustly deprived, neither he nor the church ever made a separation, if the successor was not a heretic." The original Greek work, as well as the English translation, were both published in 1691. Amongst the numerous works published in reply to Hody, the most celebrated was written by Dodwell, and was entitled 'A Vindication of the Deprived Bishops' (Lond., 1692). In the following year Hody published another work, entitled 'The Case of Sees Vacant by an Uncanonical Deprivation' (4to, Lond., 1693), in which he supports the opinions of Nicephorus, and replies to the arguments of his opponents. These exertions of Hody in favour of the ruling party in the church did not pass unrewarded. He was appointed domestic chaplain to Tillotson, archbishop of Canterbury, which office he also held under his successor. He was presented with a living in London, and was appointed regius professor of Greek at Oxford in 1698, and archdeacon of Oxford in 1704. He died January 20th, 1706. He founded ten scholarships at Wadham College, in order to promote the study of the Greek and Hebrew languages.

Of the other works of Hody, the most important are:—1. 'De Bibliorum Textibus Originalibus, versionibus Græcis et Latina Vulgata, libri iv.' Oxford, 1704, fol., which is said by Bishop Marsh to be "the classical work on the Septuagint." The first book contains the dissertation against the history of Aristæus, which has been mentioned above. The second gives an account of the real translators of the Septuagint, and of the time when the translation was made. The third book gives a history of the Hebrew text and of the Latin vulgate; and the fourth, of the other ancient Greek versions. 2. 'The Resurrection of the (Same) Body Asserted,' 8vo, Lond., 1694. 3. 'Animadversions on two Pamphlets lately published by Mr. Collier,' 8vo, Lond., 1696. Sir W. Perkins and Sir J. Friend had been executed in 1695 for treason against the government; but previous to their execution had been absolved of their crime by some non-juring clergymen. This act was condemned by the ecclesiastical authorities, but was justified by Collier in two pamphlets which he published on the subject. 4. 'De Græcis Illustribus lingue Græcæ litterarumque humaniorum instauratoribus,' Lond., 1742. This work was published several years after the author's death, by Dr. Jebb, who has prefixed to it an account of

Hody's life and writings, to which we are indebted for the greater part of the preceding remarks.

HOERBERG, PEHR, a distinguished Swedish painter, was born in a village of Småland, in 1746. His father was a private soldier and extremely poor, and Hoerberg's youth was spent in begging, watching sheep, and other peasant's labour; and like Giotto's, his first efforts in drawing were made with sticks or chalk in the woods when performing his pastoral duties. When only fourteen years of age he entered the service of a painter of Wexjö, but he remained with him for a very short period. However, by the time he was two-and-twenty years of age he contrived to learn so much from one painter and another in his own district that he was enabled to maintain himself by his paintings, and he even ventured to take a wife. In 1784, in his thirty-eighth year, he became a student in the Royal Academy of Arts at Stockholm, in which he obtained two prizes, and made rapid progress. In 1790 he established himself at Olatorp in East Götaland, where he obtained a great reputation. In 1797 he was elected a member of the Swedish Academy, and was appointed historical painter to the king. He died in 1816.

There are eighty-seven altar-pieces by Hoerberg in Sweden, five of which are copies. His paintings altogether amount to about seven hundred, mostly religious pieces; his drawings are likewise numerous, and he executed many engravings. His execution is unfinished, but his compositions are vigorous and perspicuous; and his figures are more distinguished for character than for beauty.

The autobiography of Hoerberg was published at Upsala in 1817: it has been translated into German and Danish.

HOFER, ANDREW, a native of the village of St. Leonard, in the valley of Passeyr, was born on the 22nd of November 1767. During the greater part of his life he resided peaceably in his own neighbourhood, where he kept an inn, and increased his profits by dealing in wine, corn, and cattle. About his neck he wore at all times a small crucifix and a medal of St. George. He never held any rank in the Austrian army; but he had formed a secret connection with the Archduke John, when that prince had passed a few weeks in the Tyrol making scientific researches. In November 1805 Hofer was appointed deputy from his native valley at the conference of Brunnecken, and again at a second conference, held at Vienna, in January 1809.

The Tyrol had for many years been an appendage of the Austrian states, and the inhabitants had become devoted to that government; so that when, by the treaty of Presburg, the province was transferred to the rule of the King of Bavaria, then the ally of Napoleon I., the peasants were greatly irritated; and their discontent was further provoked by the large and frequent exactions which the continual wars obliged the new government to levy on the Tyrolese. The consequence was, that when their own neighbourhood became the theatre of military operations between Austria and France, in the spring of 1809, a general insurrection broke out in the Tyrol. His resolution of character, natural eloquence, and private influence as a wealthy citizen, joined to a figure of great stature and strength, pointed out Andrew Hofer to his countrymen as the leader of this revolt; and with him were united Spechbacher, Joseph Haspinger, and Martin Teimer, whose names have all become historical. A perfect understanding was maintained between the insurgents and their late masters, and the signal of the insurrection was given by the Archduke John in a proclamation from his head-quarters at Klagenfurth. An Austrian army of 10,000 men, commanded by the Marquis Castellar, was directed to enter the Tyrol and support the insurrection, which broke out in every quarter on the night of the 8th of April 1809. The Austrian general himself crossed the frontier at daybreak on the 9th. On their side, the Bavarians marched an army of 25,000 men into the province to quell the revolt. Hofer and his band of armed peasantry fell upon the Bavarians, whilst entangled in the narrow gleans, and on the 10th of April defeated Besson and Ledoine at the Sterzinger Mocs. The next day a troop of peasants under Teimer took possession of Innsbrück. On the 12th Besson surrendered, with his division of 3000 men. In a single week all the fortresses were recovered, nearly 10,000 troops of the enemy were destroyed, and the whole province was redeemed.

Incensed by this interruption of his plans, Napoleon despatched three armies almost simultaneously to assail the province at three different points. One of these forces was under the command of Marshal Lefebvre, who on the 12th of May defeated the united army of the Austrian soldiers under Chastellar, and the Tyrolese peasantry, under Haspinger and Spechbacher, at Feuer Singer. The troops made a bad use of their victory, slaughtering the inhabitants of the villages on their route, without distinction of age or sex. The Bavarian and French officers encouraged and took part in the excesses of the soldiers; whilst the insurgents, far from retaliating, refrained from every species of licence, and nursed their wounded prisoners with the same care as their own friends. Hofer himself was not always present in action, his talent consisting rather in stimulating his countrymen than in actual fighting; but at the battle of Innsbrück (May 28th, 1809), he led the Tyrolese, exhibited both skill and daring, and defeated the Bavarians, with a loss of 4000 men. The whole of the Tyrol was delivered a second time. But after the battle of Wagram (July 6th), and the armistice of Znaim which immediately followed,

the Austrian army was obliged to evacuate the Tyrol, leaving the helpless insurgents to the mercy of an exasperated enemy. Marshal Lefebvre now invaded the province a second time, and entered it by the road from Salzburg, with an army of 21,000 troops, whilst Beaumont, having crossed the ridge of Schnarts with a force 10,000 strong, threatened Innsbrück from the north. On the 30th of July Innsbrück submitted. A series of desperate contests followed along the line of the Brenner, mostly with doubtful success, but in one the marshal was defeated, when 25 pieces of artillery and a quantity of ammunition fell into the hands of the Tyrolese. Again on the 12th of August, Marshal Lefebvre, with an army of 25,000 Bavarian and French soldiers, 2000 of whom were cavalry, was totally beaten by the Tyrolese army, consisting of 18,000 armed peasants. The battle, which was fought near Innsbrück, is said to have lasted from six in the morning until midnight. For the third time the Tyrol was free.

After this victory, entirely achieved by the peasantry themselves, Hofer became the absolute ruler of the country: coins were struck with his effigy, and proclamations issued in his name. His power however scarcely lasted two months, and became the cause of his ruin ultimately. Three veteran armies, comprising a force of nearly 50,000 French and Bavarian troops, were despatched in October to subdue the exhausted province; and, unable to make head against them, Hofer was obliged to take refuge in the mountains. Soon after, a price having been set upon his head, a pretended friend (a priest named Douay) was induced to betray him, January 20th, 1810. After his arrest he was conveyed to Mantua, and the intelligence having been communicated by telegraph to the French emperor, an order was instantly returned that he must be tried. This order was a sentence; and after a court-martial, at which however the majority were averse to a sentence of death, Hofer was condemned to be shot. His execution took place on the 20th of February 1810, his whole military career having occupied less than forty weeks. The emperor Francis conferred a handsome pension upon the widow and family of Hofer, and created Hofer's son a noble. The Austrian government also raised a marble statue of heroic size in the cathedral of Innsbrück, where the body of the patriot was interred; whilst his own countrymen have commemorated his efforts by raising a small pyramid to mark the spot where he was taken.

HOFFMANN, CHRISTIAN GOTTFRIED, was born in 1692 at Lauben, in Upper Lusatia, and studied at Leipzig, where he took his degree. In 1718 he was made professor of law in that university, and afterwards appointed to the chair of the same faculty at Frankfurt-on-the-Oder. He was also appointed counsellor to the king of Prussia, and member of the Academy of Sciences of Berlin. His principal works are—1, 'Historia Juris Romano-Justinianei'; 2, 'Specimen Conjecturarum de Origine et Natura Legum Germanicarum'; 3, 'Introductio in Jurisprudentiam Canonico-Pontificiam'; 4, 'Nucleus Legum Imperii et Novissimarum Pacificationum'; 5, 'Prænotiones de Origine, Progressu, et Natura Jurisprudentiæ Criminalis Germanicæ'; 6, 'Novum Volumen Scriptorum Rerum Germanicarum, in primis ad Lusitiam et vicinas Regiones spectantium'; 7, 'Nova Scriptorum ac Monumentorum, partim Rariorum partim Ineditorum Collectio.' This work is a sequel to the preceding. 8, 'Series Rerum per Germaniam et in Comitibus à Transactione Passaviensi ad annum 1720 gestarum.' He also published in German 'Ausführliche Beschreibung des Russischen Reiches,' and 'Gegenwärtige Zustand der Finanzen von Frankreich.' Hoffmann's eulogium is contained in the 'Nova Acta Eruditorum' for May 1736. He died in 1735, with the reputation of one of the first jurists of his time.

HOFFMANN, ERNST THEODOR WILHELM (or AMADEUS, the name he assumed instead of Wilhelm), was born on the 24th of January 1776, at Königsberg, in East Prussia. Soon after his birth his father and mother separated, and he was brought up by an uncle, by whom he was induced, against his inclination, which led him to the cultivation of music and drawing, to study the law. From 1796 to 1800 he continued to prosecute his studies with great diligence in the courts at Glogau in Silesia and in Berlin, still however pursuing his favourite studies at every possible interval. In March 1800 he was appointed assessor to the government of Posen, and thence, through the patronage of General Zastrow, removed to be a judge at Plock in Poland in 1802, and to Warsaw in a similar capacity in 1803. Hoffman was an excellent magistrate, and highly esteemed in Warsaw, but on the entry of the French troops into that town in 1806, he found himself at once without employment, without fortune, and without the prospect of any office in his then distracted native country. He determined boldly to make his other acquirements serviceable to his support. He possessed remarkable talents: he was a poet, a musician, and an artist, but of an eccentric and hypochondriacal turn of mind, and all he produced partook of that character. His writings were fantastic, his music wild and capricious, his drawings caricatures. He taught music, wrote articles for the 'Allgemeine Musicalische Zeitung' of Leipzig, and accepted in 1808 the situation of musical director of the theatre at Bamberg. Afterwards, in 1813, he filled the same office to the Dresden theatre till 1815. At Dresden he was a witness of the bombardment of the town when the allies endeavoured to dispossess the French. Here he displayed remarkable coolness, sitting at a window with a companion, and drinking wine. He has left a few

sketches of these events, which are vivid, but not so full as might be wished from a pen so capable of giving an original picture on a large scale. After the downfall of Napoleon I., and the complete restoration of the Prussian kingdom, he was, upon petition, re-admitted as judge, and soon afterwards appointed to a seat in the royal judicatory court at Berlin, which he filled with great credit to himself as a judge till his death on the 21st of July 1822, which took place after an illness of considerable length, that had deprived him of the use of his limbs, but even under this affliction his fancy continued active, and he dictated several pieces, among which one called 'The Recovery' contains some affecting allusions to his own condition.

Hoffmann was small and weak of body, but for many years he laboured with extreme ardour, notwithstanding his convivial habits, his addiction to the free use of wine and tobacco, and his extreme nervous sensibility, which at times operated so strongly as to approach closely to insanity. Besides his professional acquirements, which were highly estimated by his colleagues, he composed the music and text of many operas: the first was the music only to Göthe's 'Schetz, List, und Rache' (Jeet, Trick, and Revenge), which was performed at Posen in 1800. He also produced a number of caricatures, highly popular at the time, of the foreign invaders of his country, and especially of Bonaparte. His first series of tales appeared at Bamberg in 1814, 'Phantasiestücken in Callots Manier.' They were followed by 'Nachtstücke,' the 'Serapionsbrüder,' and the fragment of a novel composed upon his death-bed, called 'The Adversary.' They are all distinguished by a fertile wildness of imagination, considerable humour, vivid descriptions of the beauties of nature, much insight into the inconsistencies of the human character, and sly sarcasm; but they also contain several well-drawn and highly natural characters. His works form 15 vols. in 18mo, of which a portion have been translated into French, and many of the single tales have been translated into English; clever versions of two, 'The Sandman' and 'St. Sylvester's Night,' appeared in 'Blackwood's Magazine.'

HOFFMANN, FRIEDRICH, was born at Halle in Saxony, in 1660, of a family which had been engaged for two centuries in the practice of medicine. After having graduated and received his diploma at Jena, he established himself as a physician at Minden in 1682. In 1684 he travelled through Holland and England, and on his return was appointed physician to Frederick William, elector of Brandenburg, and to the garrison at Minden. In 1688 he removed to Halberstadt, and having gained considerable celebrity both by his successful practice and his writings, he was invited by Frederick III., elector of Saxony, afterwards king of Prussia, to take the chief professorship of medicine in the University of Halle, which had just been founded. He accepted this appointment in 1693, composed the statutes of the Institution, and retained the professorship with a reputation scarcely inferior to that of his great colleague Stahl, till 1742, the year in which he died. As a practical physician Hoffmann enjoyed a celebrity second only to that of Boerhaave, who was the contemporary professor of medicine at Leyden. As an author Hoffmann was well known and esteemed throughout Europe, and he was admitted a member of the scientific societies of London, Berlin, St. Petersburg, and other cities. He was a most voluminous writer; his collected works form six thick folio volumes, and the titles of his treatises occupy thirty-eight 4to pages in Haller's 'Bibliotheca Medicinæ Practicæ.'

Except by general repute Hoffmann's writings however are now little known. He assisted considerably, by the mass of evidence which he collected in his practice, in establishing the doctrines which had been first advanced by Glisson and Van Helmont, and were more philosophically maintained by Stahl, that the phenomena of living bodies are not explicable by the laws of inanimate matter, but depend on the constant action of a peculiar principle of life. This vital principle, which he believed to emanate from the Deity, was supposed to be accumulated in the brain, whence it was eliminated and conveyed along the nerves to all parts of the body, carrying with it life and energy. He thus ascribed to the nerves a far higher importance than they had been supposed by any (except Glisson) to possess; and in this he certainly made a great advance in medical science, by directing attention more pointedly to the intimate relation in which the nervous system stands to all the others, and by referring to its influence many of the phenomena before regarded as direct results of the agency of the vital principle.

But the principal reputation which Hoffmann now enjoys is the result of the change which he effected in the doctrines supposed to explain the essential nature of disease. The humoral pathology, which ascribed all diseases primarily to a morbid condition of the fluids, which by their action on the solids produced secondary changes in them, had prevailed in all the schools, and had been almost ineffectually opposed by Glisson and Baglivi; and the only subject of dispute had been whether the primary disorder of the fluids consisted in an alteration of their physical or their chemical properties. But Hoffmann showed that the solids were more often the primary seat of disease than the fluids. He believed that all their disorders were attributable to an alteration from the healthy degree of action, or, as he called it, tone, which constitutes the natural state of the moving fibres, a term in which he included nearly all the tissues of the body; if this tone were increased, spasm was said to result; if it were decreased, atony or relaxation was produced; and these opposite conditions occurring

in one or other of the chief systems of the body, the nervous or the vascular, produced, he thought, every variety of disease.

Hoffmann's theory has itself long ceased to be studied, but it formed the basis upon which many others, more nearly approaching to accuracy, were founded. Cullen acknowledges that his own doctrines were in a great measure founded upon it; and Brown's hypothesis of exhausted and accumulated excitability, upon which that of Rasori, still received in the Italian schools, was founded, was another modification of the same theory of Hoffmann. In this country some of his terms alone are preserved to express similar and rather indefinite ideas. In the applications of his theory to the details of physiology and pathology, he adopted several explanations from both the mechanical and the chemical doctrines of his predecessors; in his practice he was extremely simple, and, by comparison with modern physicians, temporising and inefficient. In accordance with his theory, most medicines were deemed by him to act either as tonics or as antispasmodics; the former class including all stimulant, and the latter all depressing agents; but he also admitted alteratives and evacuants. His knowledge of chemistry and pharmacy was extensive, and we owe to him the discovery and first introduction of the Seidlitz waters and the purgative salt obtained from them.

The best edition of his complete works is that published at Geneva in 1748, in 6 vols. folio; and his best treatises are the 'Medicina Rationalis Systematica,' which occupies the first 3 volumes, and the 'Consilium Medici.'

(Life prefixed to his works; Broussai, *Examen des Doctrines Médicales*, vol. ii.)

HOFFMANOWA, KLEMENTYNA Z TANSKICH, a distinguished authoress, who has been sometimes called the Polish Miss Edgeworth, was born at Warsaw, on the 23rd of November 1798. The form and arrangement of her name conveys to a Pole that her maiden name was Tanska, her father's being Tanski, and that she was married, and her husband's name was Hoffman. The practice of retaining the maiden name in conjunction with the married one might be adopted with advantage in other countries; and an example has been set by a very distinguished authoress in our own language, Mrs. Harriet Beecher Stowe, formerly Miss Harriet Beecher. Just before Klementyna's birth, her mother, Maryanna z Czempinskih Tanska, had been reading 'Sir Charles Grandison,' and was so charmed with the story that she determined if she had a son he should be named Charles, and if a daughter, Clementina. The father of the family, Ignacy Tanski, who was the translator into Polish of parts of Virgil and Goldsmith, died in 1805, and the daughter received an excellent education under the care of her mother. Her patriotic sentiments in regard to the national language appear to have awakened with unusual energy about her twentieth year. She commenced keeping a diary on the 1st of January 1818, the first entry in which is on the subject of language;—"Frenchness, or Frenchism (Francuzyzna), is going out of fashion, and many persons now feel, think, speak, and write in Polish. . . . I grew up in the false opinion that it was quite an unbecoming thing for a lady to write a letter or anything else in Polish; I am now convinced how erroneous the opinion was, and that we may express ourselves as well in Polish as in French. I am ashamed of my long-continued blindness, and would willingly exchange my power of French composition for a good Polish style, free from errors, and thoroughly Polish." "We have," she afterwards says, "few women who write Polish; but I doubt after all if they do not surpass in number those who read it." This state of affairs was soon changed by her own agency. Her first work, 'Six Historical Tales,' was followed in 1819 by her 'Memorial of a Good Mother' ('Pamiatka po dobrej Matce'), which had the most astonishing success. It is written in the character of a dying mother giving her last advice to her daughter; and the original idea was taken from a German work of the same character, which the Polish imitation must have far surpassed in execution, as it was itself translated into several languages, Russian included. The 'Pamiatka' still continues a standard book to put in the hands of Polish ladies. It was followed by a series of works, one of which, 'Amelia, a Mother,' a Catholic religious novel, proved a failure; but the others raised her reputation so high that a pension was granted her by the government, and when, in 1827, a normal school for governesses was established in Warsaw, Klementyna Tanska was named the superintendent, and was also appointed visitor of all the boarding-schools for young ladies. Her success as an authoress was very remarkable in another point of view. "As it is a thing sufficiently rare," she says in her diary of the 1st of March 1829, "that a woman born in the higher ranks of society should be able to maintain herself suitably by literary labour, I have resolved to note down carefully my pecuniary history." The sum total of her gains by the pen in the course of ten years was 41,878 Polish florins (about 1040*l.*). In 1829 she was married to M. Hoffman. The marriage appears to have been a very well-assorted one: she writes in her diary a few months afterwards, "I say it in the sincerity of my soul, and before the God whom I have in my heart, that I am so happy that I do not know what else to wish for, except that it may last." The Polish insurrection, which broke out in the following year, changed the entire aspect of affairs. Klementyna and her husband joined in the movement, and she was the head of a committee of ladies to scrape lint and attend to the wounded. After the suppression of the

insurrection she followed her husband, who had escaped to Dresden, and they afterwards settled at Paris, which became their permanent residence. At one time she was coming on a visit to England, but circumstances prevented her; she was however enabled to make a tour in Switzerland and Italy. She died at Paris on the 20th of September 1845, in the arms of her husband, and was buried at Père-la-Chaise. Though her most popular work was written in the character of a mother, she never had a child.

There are two collections of her works, occupying 19 vols. The first, 'Wybor Pism,' &c. ('A Selection of the Writings of Klementyna Hoffmanowa'), 10 vols., Breslau, 1833, contains the 'Memorial of a Good Mother,' two volumes of historical tales, the subjects taken from Polish history; two volumes of moral tales illustrating Polish manners; a collection of short Polish biographies; two volumes of letters describing tours in Poland; a series of letters on education; and a volume of 'Varieties.' The second collection, 'Pisma Posmiertne' ('Posthumous Writings'), 9 vols., Berlin, 1849, comprises three volumes of memoirs, consisting chiefly of extracts from her diary, three volumes of essays on the duties of women, and three volumes of extracts from her common-place books. The chief interest of these works in the eyes of a foreign reader will be found in the completely national character of their subjects. Her letters descriptive of tours to Warsaw, Cracow, Lublin, &c., are the best, almost the only book for acquiring some general and yet familiar notions of Polish topography. Such books are extremely rare in the language. "Who travels to France or England," she says in the first page, "is of course in duty bound to write a journal. But what, say some, will you put in a book of travels in Poland? What is there curious in our country? What can one do in travelling here but get a good sleep in one's carriage, wake up in time for refreshment—stopping of course at a filthy inn—amuse oneself with some French or English novel, or get another sleep if the roads will allow." The volume of biographies of eminent Poles has also the recommendation of supplying a desideratum. Her own memoirs and diary afford a glimpse of the life and manners and tone of society at Warsaw—a mixture of heroism and frivolity, sincerity and shallowness—which cannot easily be obtained from other sources. The style of her works is throughout easy and agreeable.

HOFLAND, THOMAS CHRISTOPHER, was born at Worksop, Nottinghamshire, December 25th, 1777. His father, an extensive cotton-manufacturer, removed to London in 1789, but the business on which he had entered failed, and young Hofland at the age of eighteen turned to landscape-painting as a profession. For some time he was chiefly engaged in teaching drawing in London and its vicinity, when he removed to Derby to follow the same pursuit. There about 1808 he married Mrs. Hoole, a lady subsequently well known as an authoress, of whom a notice will be found below. In 1811 he returned to London with a view to practise as a landscape-painter, but in order to secure an immediate maintenance he for some years painted numerous copies from the pictures exhibited at the British Gallery, of Claude, Poussin, Wilson, Gainsborough, and other eminent masters of the art, which met with ready purchasers, while his original works found few or none. A couple of night-scenes exhibited at the Royal Academy in 1812, obtained him some commissions, and he was enabled gradually to give up the wearisome toil of copying for bread. The literary labours of his excellent wife, it ought to be mentioned, tended in no small degree to remove his pecuniary difficulties.

Hofland was steadily securing his position as an artist when he unfortunately obtained the patronage of the late Duke of Marlborough, who, having lavished a great deal of money on his seat of White Knights near Reading, was anxious to have a handsomely illustrated description of it. He fixed on Hofland as the most suitable person to make the drawings, and his wife to write the descriptions; and unluckily the painter was further induced by the duke to make on his own account the engagements with the engravers. The consequence was, that not only did Hofland receive no compensation for his own and his wife's labours, but he was called upon to meet the engravers' bills. This affair involved Hofland in pecuniary embarrassments, which it required many years of economy to surmount; but his liabilities were all eventually honourably discharged. From this time Hofland resided in or near London, pursuing without any remarkable change of circumstance the even tenor of his way. Every summer or autumn he made the accustomed sketching and angling tour, and every winter and spring he prepared his pictures for the annual exhibitions. In his sixty-third year he visited Italy, but it was too late to derive professional improvement from his studies there, though he made a large number of sketches, and on his return painted several pictures of Italian scenery.

The landscapes of Hofland had few of the qualities which attract the popular gaze, and he had to work his way to public favour slowly. For the most part his pictures were taken from the rivers and lakes of Scotland and Cumberland, of Wales and Ireland; and the quieter passages of our British river and lake scenery have probably never been given with a more genial appreciation of their true characteristics, or a more poetic feeling of their gentler graces. Seldom did he approach the grand or sterner phases of lakes and mountains, or the marvellous atmospheric phenomena occasionally to be witnessed among them, and when he did he failed to convey their meaning; but

in his own chosen walk he produced landscapes which came home with peculiar freshness and enjoyment to everyone who had wandered among the scenes he had rendered palpable on his canvases. His style of painting was broad and masculine, free from all trickery and prettiness, but somewhat sombre in tone and colour, and wanting in firmness and vigour of touch. As hinted above, Hofland was an enthusiastic angler, and he showed his knowledge as well as love of the 'gentle art' by publishing, in 1839, an elegantly-illustrated volume entitled 'The British Angler's Manual.' From its commencement, Hofland was a member of the Society of British Artists, and one of the most regular contributors to its annual exhibitions; but he also usually sent some pictures to the exhibition of the Royal Academy. In private, and still more in domestic life, he was of a very wayward temper, and somewhat too fond of society. He died on the 3rd of January 1843.

BARBARA HOFLAND, wife of Thomas Hofland, was the daughter of Mr. Robert Wreaks, a partner in a manufactory at Sheffield, where she was born in 1770. In 1796 she married Mr. Hoole, a gentleman engaged in the same line of business as her father; he died in about two years, leaving her with a son. Some ten years later she became the wife of Mr. Hofland, then a drawing-master at Derby. She had already employed her pen as a means of augmenting her income; but after her removal to London she became one of the most prolific of the female writers of the day. Her works were chiefly addressed to the young, and their interesting style, narrative power, purity of morals, and instructive character, won for them extensive popularity both in England and America, where several of them were reprinted. According to her biographer, "nearly 300,000 copies of her works were sold during her life." One of the earliest of the publications which secured her reputation was the 'Clergyman's Widow;' but the best, as well as the most generally known of her works, was the 'Son of a Genius,' of which twenty editions have been printed here, and which, as well as being several times reprinted in America, has had the fortune to be translated into several languages. Of her other works, it may be enough to mention 'The Daughter-in-Law;' 'Emily;' the series bearing the titles of 'Energy,' 'Self-Denial,' 'Decision,' and the other moral virtues; 'The Czarina;' 'Says She to her Neighbour—What?' 'King's Son;' 'Young Crusoes;' 'Little Dramas for Young People;' 'Tales of the Manor' (which, like several other of her stories, is in four volumes); and 'Emily's Reward, or a Holiday Trip to Paris,' finished just before her death. Her writings are the reflex of her character, which was in every respect amiable. She survived her second husband scarcely two years, and one of her latest literary productions was a brief memoir of him, which she contributed to the 'Art Journal' of March 1843, and to which we are indebted for most of the facts in our notice of him. She died on the 9th of November 1844. A brief memoir of her life by Mr. T. Ramsay, with a selection from her literary remains, appeared in 1849.

* HOFMANN, DR. A. W., a distinguished chemist. Dr. Hofmann studied chemistry in Germany under the distinguished Liebig, and when the College of Chemistry was established in London in 1845, he was recommended by that chemist as highly fitted for the important post of superintendent of the new institution. Through Dr. Hofmann's labours the Royal College of Chemistry obtained a distinguished position amongst the educational institutions of this country, until it was finally merged in the Metropolitan School of Science applied to Mining and the Arts. The Royal College of Chemistry is now the laboratory of the last institution, and still under the direction of Dr. Hofmann. In the recent rapid and astonishing advances of organic chemistry, Dr. Hofmann has taken a prominent and distinguished part, not only in his lectures at the College and the School of Science, but in his various papers published in the 'Transactions of the Chemical Society,' and in the 'Philosophical Transactions of the Royal Society.' In the former he has published a series of papers on the nature of Indigo and its compounds, which have contributed greatly to our existing knowledge of the highly curious compounds procured by the decomposition of this substance. In the 'Philosophical Transactions' he has published two papers, entitled 'Researches regarding the Molecular Constitution of the Volatile Organic Bases.' In these papers he has extended the views of Berzelius and Liebig, and the researches of Wurz on the nature of the compounds of ammonia, and succeeded in discovering several highly interesting compounds. These and other discoveries must always connect the name of Hofmann with the present rapid development of the science of organic chemistry.

Although Dr. Hofmann is a foreigner, he has so far succeeded in mastering the difficulties of our language as to be a fluent and highly popular lecturer on chemistry. He has delivered several courses of lectures at the Royal Institution of Great Britain with eminent success. His first course, delivered at this institution, has been published entire in the 'Medical Times and Gazette.' He has also edited, in conjunction with Dr. Bence Jones, the recent edition of Fowne's 'Elements of Chemistry.' On the elevation of Professor Graham from the post of chemist to the Mint to the position of master, Dr. Hofmann was appointed Professor Graham's successor. Dr. Hofmann's services have been often rendered in the practical application of chemistry to the sanitary questions of the day. He has thus, at the request of the government, examined chemically the waters of London. He was also employed, in conjunction with Professor Graham, to examine the

bitter ales supplied to the public, when a suspicion arose that they had been adulterated with strychnia. It was in this investigation that these chemists first showed how minute a quantity of this substance could be detected by chemical reagents. Dr. Hofmann is a Fellow of the Royal and member of other scientific societies of Europe.

* HOGAN, JOHN, was born in October 1800, at Tallow, in the county of Waterford. At the age of fourteen he was placed in the office of a solicitor in Cork, but the boy's fondness for art was so manifest, that, after a brief trial, he was removed to the office of Mr. (now Sir Thomas) Deane, the eminent architect of that city. But as it became evident that his bent was towards sculpture, Sir Thomas kindly encouraged, instead of thwarting, his inclination; and though Hogan remained with him till 1823, his time was wholly devoted to the acquisition of the various branches of the sculptor's art. Many of the carvings which he executed during this period for the buildings on which Sir Thomas Deane was engaged, are said to evince great ability, both as regards design and execution. He also, in 1822, carved for Dr. Murphy a series of forty wooden figures of saints, each three feet and a half high, for decorations of a Roman Catholic chapel in Cork. In 1823 he was enabled, by the kindness of Lord de Tabley and other friends, to proceed to Rome. There, after diligently prosecuting his studies for about a year, he produced his first work in marble, a 'Shepherd Boy,' which was purchased by Lord Powerscourt; his next was an 'Eve, after her expulsion from Paradise, finding a Dead Dove,' a work of much originality, which was executed for Lord de Tabley. To this succeeded his 'Drunken Faun,' which at once established his reputation. Mr. Hogan returned to Ireland in 1829, when he exhibited in Dublin a fine figure, 'The Dead Christ,' which now forms part of the high altar of the Roman Catholic chapel, Clarendon-street, Dublin. From this time the sculptor found among his countrymen, and among the Roman Catholic clergy, ample patronage and support; but their commissions have to a great extent diverted his chisel from the poetic class of works on which it was first engaged to monumental and ecclesiastical subjects. Among his chief monumental works may be mentioned his statues of Daniel O'Connell, W. Crawford, Bishop Brinkley, monuments to the memory of Dr. Collins, the Roman Catholic bishop of Cloyne, to Dr. Macnamara, to Dr. Doyle, to W. Beamish of Beaumont, to Peter Purcell, and to a daughter of Curran. Among the ecclesiastical his alto-relievo of the 'Deposition from the Cross,' for the convent of Rathfarnham, and 'The Nativity,' for a chapel at Dalkey. He has also executed numerous excellent busts of eminent Irishmen, including Father Mathew, O'Connell, &c. Mr. Hogan has been for some years settled in Dublin. (*Art Journ., &c.*)

* HOGARTH, GEORGE, musician and critic, was born in Scotland about 1796, and commenced life as a writer to the signet, at Edinburgh, where he was one of the select circle clustered round Scott—the Erskines, Terrys, and Ballantynes— one of the latter, James, marrying Mr. Hogarth's sister. His musical ability and knowledge subsequently led him to abandon the law, and he has since devoted himself entirely to the literature of music. Coming to London, he has for many years contributed various articles on the subject to the 'Morning Chronicle,' and published, in 1835, 'Musical History, Biography, and Criticism.' This was followed in 1838 by 'Memoirs of the Musical Drama,' a second and enlarged edition of which, under the title of 'Memoirs of the Opera—Italy, France, Germany, and England,' was published in 2 vols. in 1851. Mr. Hogarth has published also 'The People's Service of Song; a Tune-Book for the Poor,' and contributed to Aris's 'Birmingham Gazette' some valuable papers on the 'Birmingham Musical Festivals.' In 1846, on the establishment of the 'Daily News,' Mr. Hogarth accepted office under his son-in-law, Mr. Charles Dickens, and became musical critic to the new journal, to which he has since entirely devoted his abilities.

HOGARTH, WILLIAM, was born in the parish of St. Bartholomew the Great, London, in 1697, and baptised in the parish church on the 28th of November. His father Richard Hogarth (or Hogart, as the name seems originally to have been written and pronounced) died in 1721, leaving two daughters and one son, William. Of William Hogarth's education nothing has been recorded; but we may conclude that it was slight from the frequency of his errors in grammar and orthography. "My father's pen," writes Hogarth himself, "like that of many authors, did not enable him to do more for me than put me in a way of shifting for myself. As I had naturally a good eye and a fondness for drawing, shows of all sorts gave me uncommon pleasure, and mimicry, common to all children, was remarkable in me. An early access to a neighbouring painter drew my attention from play, and I was at every possible opportunity employed in making drawings. My exercises when at school were more remarkable for the ornaments which adorned them than for the exercise itself. In the former I soon found that blockheads with better memories would soon surpass me, but for the latter I was particularly distinguished."

It was at his own wish that he was apprenticed to Ellis Gamble, a silversmith in Cranbourne-street; but he soon found this business too limited, and its scope insufficient for his fancy. "The painting of St. Paul's Cathedral and Greenwich Hospital," he writes, "at this time going on, ran in my head, and I determined that silver-plate engraving should be followed by me no longer than necessity obliged me to it. Engraving on copper was at twenty years of age my utmost ambition." In 1718 Hogarth ceased to be an apprentice, being twenty-one years

old; and, according to Walpole, he attended Sir James Thornhill's academy in St. Martin's-lane, where he "studied drawing from the life, in which he never attained great excellence." His livelihood was earned by engraving arms, crests, ciphers, shop-bills, and other similar works, until 1724, when he published his first original engraving, now called the 'Small Masquerade Ticket, or Burlington Gata.' Illustrations to Mortraye's 'Travels,' 'Hudibras,' and other books, were supplied by him in 1725 and the following year, which, with the help of some small etchings of scenes of town life and folly, replenished his purse, and gained him a moderate reputation. He now paid his addresses to Jane, daughter of Sir James Thornhill, to whom he was united in 1730, without the consent of her parents. Her father resented the marriage as a degradation to his daughter, and was not reconciled to her until two years after it had taken place. The facility which Hogarth had gained in the use of the brush now induced him to attempt portrait-painting; but although he was not unsuccessful in the treatment of many of his subjects, the style did not satisfy his mind: there was too much copying, as it were, and too little room for ingenuity and invention, to compensate for the drudgery. He accordingly abandoned portrait-painting, and entered upon that original style on which his fame rests. "The reasons," he says, "which induced me to adopt this mode of designing were, that I thought both writers and painters had, in the historical style, totally overlooked that intermediate species of subjects which may be placed between the sublime and grotesque."

Before he had done anything of much consequence in this walk he entertained some hopes of succeeding in the higher branch of historical painting. "He was not," says Sir Joshua Reynolds ('Discourses,' vol. ii., p. 163), "blessed with the knowledge of his own deficiency, or of the bounds which were set to the extent of his own powers." "After he had invented a new species of dramatic painting, in which probably he will never be equalled, and had stored his mind with infinite materials to explain and illustrate the domestic and familiar scenes of comic life, which were generally and ought always to have been the subject of his pencil, he very imprudently, or rather presumptuously, attempted the great historical style, for which his previous habits had by no means prepared him."

After this failure as an historical painter, he resumed his former manner, engraving, as had been his custom, the pictures which he had painted. The eager demand for these engravings induced the print-sellers to pirate them; and the piracies so diminished the profits of the author that he applied to parliament for redress: in consequence of his application a bill was passed in 1735, granting a copyright of a print for fourteen years after its publication. The reputation of Hogarth was now established, and he continued to paint with undiminished ability. At the age of forty-eight he was in easy circumstances, and rich enough to keep a carriage. The sale of his prints was his principal source of income: the price of his pictures kept pace neither with his fame nor with his expectations. We find that in 1745 he sold by auction nineteen pictures, including the 'Harlot's and Rake's Progresses,' for 427*l.* 7*s.*, a sum most unequal to their merits. Some conditions which he had very whimsically annexed to the sale appear to have diminished his profits. In 1753 he published his 'Analysis of Beauty,' in which he attempted to prove that the foundation of beauty and grace consists in a flowing serpentine line: he cites numerous examples; and though his conclusion is unsound, his arguments are both amusing and ingenious. They were attacked and ridiculed by a host of his envious contemporaries; but the work was translated into French, Italian, and German.

For an account of Hogarth's contests with Wilkes, the celebrated politician, we must refer to his biographers. After his sixty-sixth year Hogarth's health began to decline, and he died on the 26th of October 1764. He was buried in the churchyard at Chiswick, where his wife was also interred in 1789. They had no children. A monument inscribed with some verses by Garrick marks the site of the great painter's grave: having become somewhat dilapidated it was restored in 1856 by a namesake of the painter.

Hogarth is the first English painter who can be said to have acquired any name among foreigners: he is also one of the earliest English painters who can be considered an original genius. His style of painting may be characterised as the 'satirical'; the satire being sometimes humorous and comic, sometimes grave, bitter, and tragic. His subjects are chosen from common life, among all classes of society, in his own country and in his own time. His comic-satirical vein may be seen in the 'Enraged Musician,' the 'March to Finchley,' 'Beer Lane,' &c.: his tragic-satirical vein is exemplified in the 'Harlot's Progress,' the 'Rake's Progress,' 'Gin Lane,' &c. The series of 'Marriage à la Mode' contains pictures in both these veins. In the latter style his works are analogous to those of Swift. He also resembles Juvenal, in unmercifully chastising and laying bare the vices and weaknesses of mankind. The exaggeration of salient peculiarities, and the accumulation of characteristic incidents, which are conspicuous in the works of Hogarth, properly place him in the rank of caricaturists. At the same time, he never departs so widely from nature as to mar the effect of his composition. To such an extent is he a caricaturist, that he has been said to *write* rather than *paint* with the brush. Although caricature, as its name imports, originated among the Italians, Hogarth must be considered as the great master

of this style. But the great merit of Hogarth's pictures is that they have a serious purpose, and that every part, and every object almost, in each picture, whether the picture be an independent one, or one of a series, subserves that purpose. Further it must be remarked—that is too often overlooked in regarding the genius of Hogarth—that his pictures are in the strictest sense original. For neither subject nor suggestion is he indebted to any other writer or painter. Story, character, and treatment are alike entirely his own. His invention is unbounded, and every part of his picture, whatever be the subject, teems with meaning; and, what is a prime virtue in a moral satirist, the meaning is always perfectly clear.

Concerning the merits of Hogarth's technical execution, there has been some difference of opinion. As to the excellency of his drawing and composition there can, we presume, be no doubt in the mind of those who have seen his original pictures. On this subject generally, we quote the opinion of Dr. Waagen respecting the series of 'Marriage à la Mode,' whose high authority we consider altogether decisive. "What surprises me," he says, "is the eminent merit of these works as paintings, since Hogarth's own countryman Horace Walpole says he had but little merit as a painter. All the most delicate shades of his humour are here marked in his heads with consummate skill and freedom, and every other part executed with the same decision, and for the most part with care. Though the colouring on the whole is weak, and the pictures, being painted in dead colours with hardly any glazing, have more the look of water-colour than of oil-paintings, yet the colouring of the flesh is often powerful, and the other colours are disposed with so much refined feeling for harmonious effect, that in this respect these pictures stand in a far higher rank than many of the productions of the modern English school, with its glaring inharmonious colours." (Waagen, 'Arts and Artists in England,' German edit., vol. i., p. 230.) Hogarth appears to have avoided high colouring, lest the attention of the spectator should be distracted from the subject of the picture. In the National Gallery there are seven of his pictures, consisting of his own portrait and the series of the 'Marriage à la Mode.'

HOGG, JAMES, commonly called the Ettrick Shepherd, was born in the forest of Ettrick in Selkirkshire in 1772, and, as he latterly insisted, on the 25th of January, the birthday of the poet Burns, although that date appears to have been opposed both to his own previous statements and to other evidence. His forefathers had been shepherds for many generations, and although his father, Robert Hogg, at one time took a lease of two farms and began business as a dealer in sheep, the speculation proved unfortunate, and he was compelled to fall back to his original condition, in which also his son James and three brothers were all brought up. Hogg was fond of giving himself out as nearly altogether self-educated; he has stated that all the instruction he ever received was from being two or three winters at school before he had completed his eighth year; but there is reason to believe that in this particular also his account of himself is to be regarded as somewhat poetical. He first began, he tells us, to be known as a maker of songs among the rustic population of his native district in 1796, at which time he was a shepherd in the service of Mr. Laidlaw of Blackhouse. Here we have another coincidence, for that was the very year in which Burns died. The first of his productions that was printed appeared anonymously in 1801, his song of 'Donald MacDonald,' a patriotic effusion on the subject of the threatened French invasion, which immediately became a great popular favourite in Scotland. Soon after, having gone to Edinburgh to sell his master's sheep, he gratified his vanity by getting 1000 copies thrown off of a small collection of his verses, which however he was afterwards very sorry he had allowed to see the light.

It was in the summer of 1801, while he was still with Mr. Laidlaw, that he was discovered by Sir Walter Scott, then engaged in collecting materials for his 'Minstrelsy of the Scottish Border.' Hogg contributed a number of old songs or ballads, which he had collected from the recitation of persons in the forest, to the third volume of the 'Minstrelsy,' which was published in 1803. That year another collection of his poems, of much superior merit to the former, was published at Edinburgh, under the title of the 'Mountain Bard,' the proceeds of which, with two prizes he got from the Highland Society for essays on the rearing and management of sheep, put him in possession of about 300*l.* With this money he took a farm, which soon turned out a ruinous concern. For some time he attempted without success to get employment again as a shepherd, and at last, in February 1810, "in utter desperation," he says, "I took my plaid about my shoulders, determined, since no better could be, to push my fortune as a literary man." This was the commencement of a life of busy authorship, which may be said to have lasted till his death, although in 1814, after having married, he returned to the country to live on a farm given to him by the Duke of Buccleuch, which soon however, under his management, came to yield as little profit to the occupier as rent to the proprietor. We cannot enter into the long history of his varied but constantly-struggling life, marked as it was by much more than the usual share of fluctuation and casualty, and by many curious passages arising out of his transactions with the booksellers and his intercourse with some of his distinguished literary contemporaries. He has prefixed a full memoir of his own life to an edition of his 'Mountain Bard,' published in 1821; and many fragments of autobiography are to be found scattered up and

down in his other works. These various sketches however, it is proper to remark, are very far from being perfectly consistent with each other; and some of the statements have been denounced by other parties implicated in them as complete misrepresentations or fictions.

Of Hogg's poetical works, by far the most remarkable is his 'Queen's Wake,' first published at Edinburgh in 1813. It is undoubtedly a very extraordinary performance to have proceeded from a person of the author's opportunities, but it has also merits of a kind that do not require the peculiarity of the circumstances in which it was produced to excite admiration. The wild imagination of some parts, the gentle beauty of others, and the spirited flow of the poem throughout, greatly took the public taste, and it went through many editions both in this country and in America in a few years. The author never attained the life, or even the polish, of this early work in anything he afterwards wrote; although some of his songs were very happy imitations of the fine old popular poetry of his country, and both in these, and in passages of his prose fictions, there is often a humour rich, vigorous, and original, though apt to degenerate into the coarse or extravagant. Of the rest of his works, the chief are (besides contributions to 'Blackwood's Magazine' and other periodical publications)—in poetry, 'Madoc of the Moor,' 'The Pilgrims of the Sun,' 'The Poetic Mirror' (a collection of pieces in imitation of living poets), and 'Queen Hynde,' besides his collections of pieces partly original, partly ancient, entitled the 'Jacobite Relics of Scotland,' the 'Border Garland,' a 'Selection of Songs,' and the 'Forest Minstrel'; in prose, 'The Brownie of Bodsbeck,' 'Winter Evening Tales,' 'The Three Perils of Man,' 'The Three Perils of Woman,' 'The Confessions of a Justified Sinner,' 'The Altrive Tales,' 'The Domestic Manners and Private Life of Sir Walter Scott,' and a volume of 'Lay Sermons.' His death took place at his farm of Altrive, on the 21st of November 1835.

HOHENLOHE-INGELFINGEN, PRINCE FREDERICK LOUIS, a general of infantry in the service of Prussia, was born January 31st, 1746. Having adopted the military profession, he became a lieutenant-general before the Revolution. In this capacity he was appointed to command the vanguard of the Duke of Brunswick in July 1792, and on the 30th of that month he passed into the French territory. The prince distinguished himself greatly in the first campaign, and urged his leader to make for the capital. At the forcing of the lines of Weissenberg, under Wurmser, in 1793, his courage and energy were conspicuous. In 1795 the king of Prussia gave him the command of the army along the Rhine, posted there as a neutral cordon; he was likewise appointed Inspector-General of the troops in Silesia. In all these military offices his conduct met with the approbation of his superiors, and when his father's death called him to the rule of his small dominions, the king of Prussia, after presenting him with a sword set with diamonds, conferred on him the government of Breslau.

In 1806 he was entrusted with the command of the Prussian and Saxon army, ordered to invade Franconia; but the great battle of Jena, October 14, 1806, so fatal to the arms of Prussia, rendered all his efforts abortive. He was compelled to retreat on Stettin, and subsequently to abandon the defence of Berlin and Magdeburg. The rest of his career was an unbroken series of reverses: at Lochnitz he was defeated by Murat, at Prenzlau Grouchy reduced him to such straits as obliged him to capitulate with 16,000 men. After these disasters his spirit was utterly broken; he wrote a touching letter to his master, describing the causes of his late surrender; transferred his principalities to his sons, and then having withdrawn to a castle he possessed in Upper Silesia, spent the last ten years of his life in retirement. At this castle he died on the 26th of February 1817.

HÖIJER, BENJAMIN CARL HENRIK, a philosopher of very high reputation in Sweden, whom Hammaršköld, the historian of Swedish philosophy, describes as "the most distinguished man of his country and his age, whom Europe will one day number with pride among its thinkers." He was born on the 1st of June 1767 at Klingsbo in Dalecarlia, the son of the minister of the parish. In 1783 he became a student at Upsal, and in 1788 took his degree as a doctor of philosophy. In Sweden as in many other countries the outbreak of the French revolution excited a ferment among the young and ardent in its favour; at Upsal a society was formed under the name of 'the Junta,' of which Höijer was the leader and the soul. They were soon of course stigmatised as Jacobins, and it was probably to a wish to draw his principles into prominence that he was indebted for the appointment to deliver a public oration before a portion of the university on the occasion of the assassination of Gustavus III. by Ankerström. Höijer's spirit was not high—he pronounced a panegyric on the monarch who had effected a regal revolution, and even declared "I should not hesitate for a moment if the choice were offered me, rather to be the subject of a wise king, than to be even a powerful citizen in a falling republic under the despotism of the many." His prospects were nevertheless destroyed—he applied for a professorship six times in vain, and went abroad to Germany and France apparently in search of some other career, but returned to Upsal. His disappointment soured his temper, and he gave indulgence to a spirit of sarcasm which did not conciliate his enemies, who had also the advantage of being able to allege that his habits were remarkably licentious. At length, when, in 1803, the professorship of philosophy was once again vacant, and he had again applied for it with small hopes of success, the sudden revolution took place which dethroned Gustavus IV., and

many of Höijer's old friends of the Junta came into power. He received the long sought-for prize, but did not long enjoy it. He died on the 13th of June 1812.

Höijer was a lecturer of great excellence, and as a writer was noted for elegance of style. His works were collected and published by his half-brother Joseph Otto Höijer, professor of Greek literature at Upsal, in five volumes ('Samlade Skrifter,' Stockholm, 1825-27). A sixth was to follow, containing notes of his travels and other miscellaneous matter, but it has never appeared. A considerable portion of what was published was put together from brief notes of the heads of his lectures, merely intended for his own use, which were found after his death. The subjects of the whole are discussions on different points of metaphysics and æsthetics. An 'Essay on the Philosophy of Construction,' which was first published in 1799, was translated into German and spoken of with high approbation in Schelling's journal. Hammaršköld describes the fundamental principle of Höijer's views in philosophy as this—that the natural condition of man is that in which he desires to be, not that in which he is. His more important contributions to æsthetics are an 'Outline of a History of the Fine Arts,' 'Lectures on the Philosophy of the Fine Arts,' and 'The Eloquence of the Ancients and Moderns compared.' His general views were in favour of the "romantic" as distinguished from the "classical" school in literature, but his own style of composition was of a neat, correct, and classical character. His reputation appears to be rather on the rise than the wane in Sweden.

HOLBACH, PAUL THYRY, BARON D', was born in 1723 at Heidesheim, in the Palatinate, of a wealthy family. He spent the greater part of his life in Paris, where he became the friend and patron of many of the men of learning about Paris, especially of those who contributed to the first Encyclopædia. [DIDEROT.] Holbach was himself a great admirer and disciple of Diderot. The baron was fond of conviviality, and he gave good dinners; for nearly forty years he assembled round his table every Sunday a coterie of literary men, including at one time Diderot, Rousseau, Marmontel, Galiani, Grimm, Damiaville, Morellet, Helvetius, and others. This coterie had at first assembled at Madame Geoffrin's; but that lady not proving bold enough in her way of thinking, they transferred their meetings to the house of the Baron D'Holbach, who was a freethinker of the freest kind, and with whom they had no reason for disguising their opinions. Much information concerning these parties is given in the memoirs of the Abbé Morellet, of Madame D'Épinay, in Grimm's 'Correspondence,' and lastly, in a curious though not very impartial work of Madame de Genlis, styled 'Les Dîners du Baron D'Holbach, dans lesquels se trouvent assemblés, sous leurs noms, une partie des Gens de la Cour et des Littérateurs les plus remarquables du 18 Siècle.' D'Holbach was acquainted to a certain extent with the physical sciences, especially chemistry and metallurgy, and he translated into French several useful German works on those subjects: he also contributed many articles to the 'Encyclopædie.' He wrote, either wholly or in part, several philosophical works, which were published in Holland under fictitious names, and of which those which made most noise at the time are—1. 'Le Système de la Nature,' a system of pure materialism, and which Voltaire characterised as absurd as to physics, illogically written, and abominable as to ethics. Frederick II. undertook to refute it; but the best refutation of it is that of Bergier, in the 'Examen du Matérialisme.' 2. 'Morale Universelle, ou Devoirs de l'Homme fondés sur la Nature,' 3 vols. 8vo, Amsterdam, 1776. This work is much better written than the preceding, the precepts are generally good, and the tone is calm, rational, and tolerant. 3. 'Le Christianisme Devoilé,' attributed by some to Damiaville; and other works against revealed religion, which are now mostly forgotten. D'Holbach died at Paris in 1789. He seems to have been a man of very moderate talents, rather credulous, though a sceptic, of a generous disposition, and a pleasing host and table companion.

HOLBEIN, JOHN, or HANS, is considered by the Germans to be their best painter next to Albert Durer, whom he however excelled in portraits. He painted equally well in oil, water-colours, and distemper, on a large scale and in miniature, and was besides well skilled in architecture. It is rather remarkable that neither the date nor even the place of his birth has been precisely ascertained. Some accounts say that he was born in 1498, others in 1495; the place of his birth has usually been supposed to have been either Augsburg or Basel; but from recent researches it would appear to have been Grunstadt, formerly the residence of the counts of Leiningen-Westerburg. He was instructed in the art of painting by his father, whom he soon excelled. Accompanying his father to Basel, he became acquainted with Erasmus, who was residing there in order to superintend the printing of his works. Holbein painted several portraits of Erasmus, who gave him a letter of recommendation to Sir Thomas More, and he went to England in 1526. Sir Thomas took him into his house, and after having employed him for three years, invited King Henry VIII. to see the pictures which Holbein had painted for him. The king was so delighted with them, that he immediately took Holbein into his service, and gave him ample employment, for which he recompensed him with royal munificence. The favour of the king and his own extraordinary merit occurred to bring him into vogue; so that notwithstanding his indefatigable diligence and rapid execution, he was so fully engaged in painting portraits of the nobility and eminent

public characters, that he had no leisure in England for historical painting. Of his skill in this department he had given decided proofs before he left Basel, and many of his pictures are still to be seen in that city. It appears however that he adorned the walls of a saloon in the palace of Whitehall with two great allegorical compositions representing the triumphs of riches and poverty. He likewise executed large pictures of various public transactions, such as Henry VIII. giving a charter to the barber-surgeons, and Edward VI. giving the charter for the foundation of Bridewell Hospital. Holbein was equally remarkable for the freedom and spirit of his pencil, the lightness of his touch, clearness and brilliancy of tone, and exquisite finishing. Though from his long residence in England his original pictures must have been very numerous, yet there can be no doubt that, as they represented well-known characters, many copies, of various degrees of merit, were made even during his life. This fact is too little considered in England, where portraits wholly unworthy of him are ascribed to his pencil by persons who forget that in refined feeling for nature, accurate delineation of the parts, and vigour of style, his best portraits have an honourable place beside those of the greatest masters. He died at London of the plague in 1554.

HOLBERG, BARON LUDVIG, or LEWIS, who may be regarded as the father, or, as he has been styled by some, the Colossus of modern Danish literature, was born at Bergen in Norway, in 1684. So far from being the inheritor of title or patrimony, he was of obscure family, his father having been originally a common soldier, though afterwards promoted to the rank of colonel. His death however, which happened while Ludvig was quite a child, left the family in very straitened circumstances, so that, as soon as the son had completed his studies at Copenhagen, he had no other resource than to become a private tutor. It was not long before a strong inclination for travelling led him, in spite of his exceedingly scanty finances, to set out for Amsterdam, where he had the misfortune to be attacked by a fever. He afterwards made his way back to Christianstad, where he endeavoured to gain a subsistence by teaching French; but that failing he came to England, where he stayed about two years at Oxford. On returning to Copenhagen he obtained the situation of tutor to the son of a wealthy individual, with whom he travelled through Germany. On another occasion he contrived to proceed as far as Rome, journeying for the most part, like Goldsmith, on foot. On his return to Denmark he obtained a maintenance by teaching languages, until he was appointed professor of metaphysics, and in 1720 professor of eloquence. He was now in tolerably easy and improving circumstances, and had for the first time leisure to apply himself to his pen, and turn to account the multifarious stock of learning which he had picked up in the course of his unsettled life. He had now passed his youth, nor had he given any symptoms of a talent for poetry, when he astonished and delighted his countrymen by his satires, and that masterpiece of heroic comic-poetry, his 'Peder Paars.' This production has acquired for its author the title of the Danish Butler; not however on account of any similarity of subject with 'Hudibras,' but merely as being a national and popular work of the same genus. With less wit and learning than its English rival, 'Peder Paars' is quite as lively and diverting, and replete with humorous incidents from beginning to end.

The most formidable rival to the author of 'Peder Paars' is Holberg the dramatist; for his comedies have rendered the poem only his secondary title to fame. These productions, amounting to nearly forty, and composed between 1723 and 1746, exhibit very strong graphic and comic power. Yet it must be acknowledged that his dramas are not free from defects, although they possess such vigour and spirit that we cheerfully excuse them. His 'Metamorphoses,' in which he has reversed Ovid's system, transforming animals into men, instead of men into animals, is ingenious in idea and happy in execution. But that to which some have assigned the foremost place among his productions is 'Niels Klim's Subterraneous Journey,' first published in 1741, and written in Latin, but translated not only into Danish (by Rahbek), but into almost every other European tongue. In this philosophical satire Holberg has shown himself perhaps the imitator, but perhaps also the rival, of Lucian and Swift.

These works would indicate no little industry, yet they constitute but an inconsiderable portion of Holberg's writings, whose pen was as prolific as that of Voltaire, there being hardly a department of literature which he left untried, if we except tragedy. The annals of literature afford probably no parallel instance of a comic author so admirable, and also so fertile, who was at the same time so universal. History, biography, philosophy, politics, all employed his pen in turn, and to such extent that it would occupy too much space were we to specify severally his writings of this class. Suffice it then to mention merely his 'History of Denmark,' 'Church History,' 'Historia Universalis.' What would be the exact amount of all that he wrote, if printed in a uniform series, we know not, but his select works alone, as edited by Rahbek, 1804-14, extend to twenty-one octavo volumes. Nor is our wonder at their vast number and variety diminished when we consider that he had hardly commenced authorship at a period of life when many have already produced their chief works, and that he did not live to a remarkably advanced age, for he died January 27, 1754, in his seventieth year: he had been created a noble by Frederick V. in 1747. Baron Holberg had raised himself to affluence by his writings,

and having no family, for he was never married, he bequeathed the bulk of his property (amounting to 70,000 dollars) to the Academy of Soree.

HOLCROFT, THOMAS, was born December 10, 1745 (old style). His father kept a shoemaker's shop in Leicester Fields, and occasionally dealt in horses. The first six years of his life were spent at his birth-place, but some change in his father's circumstances brought him into Berkshire, and at last to a vagrant life. When very young he became a stable-boy in racing-stables at Newmarket, and continued in the service of training-grooms till his seventeenth year, after which time he lived a desultory life as shoemaker, trampler, or schoolmaster till twenty, when he married. About this time he had proceeded far enough in self-education to venture to commit his performances to the columns of the 'Whitehall Evening Post,' but this whim soon gave way to others, and in a short time he found himself an actor. In 1780, having been some time on the London stage, he turned author, producing first a novel, then a comedy, and afterwards some poems, which were followed in their turn by a series of plays, and by translations of various French-works, of which those most remembered at present are—'Tales of the Castle,' and 'The Marriage of Figaro.' In 1789 he lost his son, and in 1790 his third wife. Four years afterwards he was implicated in the political trials relative to the Society for Constitutional Information. From this time his life presents no tangible points: he seems to have spent the greater part of his time in writing, and in cultivating the fine arts.

He lived much in Germany and occasionally in Paris, and of this residence his 'Travels into France' was the fruit, a book which has probably been depreciated below its real merit, as his plays were doubtless raised above theirs. He died March 23, 1809.

Holcroft's chief merit lay in translation. As a translator he will probably be remembered; as an author, probably he will not. His style bears all the marks of that of a half-educated man. Holcroft's life has been published, partly from diaries of his own. It is a performance the form of which private friendship has had a large share in determining. Lengthy quotations and needless talk fill three volumes, where one would have amply sufficed; divested of its superfluous matter it forms a volume of Longman's 'Traveller's Library,' and in that shape is a much more entertaining work than as it originally appeared.

HOLINSHED, or HOLLYNSHED, RAPHAEL, the annalist, was born probably during the first half of the 16th century, but when is uncertain. Anthony à Wood says that he "was educated at one of the universities, and was a minister of God's word," but it appears most probable that he was steward to Thomas Burdet of Bromcote in Warwickshire. It is possible however that the sentence in which he refers to "his master" may be interpreted on the supposition of his having been private chaplain, which would reconcile the two statements. He died about 1580, as his will was made fifteen months before, and proved two years after that time.

Holinshed is an important authority in English history, and the list of authors to which he refers shows him to have possessed considerable learning. The first edition of his history is a very scarce black-letter in two folios, adorned by numerous wood-cuts. The second and improved edition omits these adornments, and has suffered also from the censorship of the times, which compelled the cancelling of several sheets. It consists of the following items:—'Description of England,' by Harrison; of 'Ireland,' by Stanhurst; and of 'Scotland,' from the Latin of Hector Boethius, by W. H. (arrison). 'History of England,' by R. H. (olinshed); of 'Ireland till the Conquest,' from Giraldus Cambrensis, by J. Hooker (an uncle of the divine); "till 1509," by Holinshed; and "till 1286," by Hooker and Stanhurst; and of 'Scotland' till 1571, by Holinshed, and continued by others.

(Wood, *Ath. Oxon.*; *Biographia Britannica.*)

HOLKAR, MULHAR RAO, the first of the name known in history, was a Mahratta soldier, who having been instrumental in extending the conquests of his nation, under the first Peshwa, towards the north of India, received a grant of land in Malwa about 1736. Ultimately one half of that large province passed under his rule; and before his death, which took place in 1766, he had rendered himself, in all but name, independent of his titular superior the Peshwa. He was succeeded by his grandson, a minor; but this boy soon died, and the inheritance passed to Tukagee Holkar, a nephew of Mulhar, according to Mr. Mill, but, according to Captain Duff, a stranger in blood. Tukagee, dying in 1797, left four sons, whose patrimony was usurped for a time by Scindia, the most powerful of the Mahratta chiefs. In 1802 Jeswunt Rao Holkar, the third son, an able, brave, unscrupulous soldier of fortune, defeated Scindia, and re-established himself in Malwa. The Marquis Wellesley, then Governor-General, refused however to recognise his title, and in 1804 commenced a war against him, which was terminated at the end of 1805 by a peace more favourable than Holkar had reason to expect, which left to him the greater part of his dominions. The violence of his temper ultimately grew into madness; and the last three years of his life were passed in close confinement; he died in 1811. When he was placed under restraint his son, a minor four years old, Mulhar Rao Holkar, succeeded to the nominal authority; all real power being of course in the hands of one or two ministers. A wretched anarchy succeeded. After the final overthrow of the Mahratta power in 1818, Mulhar was suffered to

retain a small portion of his dominions under the protection of the British. (*Mill. Hist. of British India*; *Duff. Hist. of Malacca*.)

HOLL, ELIAS, a distinguished German architect, was born at Augsburg in 1573. His father, Johann Holl, was likewise an architect, and was much employed by the celebrated graf Fugger of Augsburg. Elias was taken when young to Venice, by a rich merchant of the name of Garb; and he there studied the Italian architecture, which style he adopted in his future works at Augsburg, though simplified in parts and in decorations. Augsburg owes to Holl a great portion of its public buildings, but his masterpiece is the Rathhaus, or town-hall, built 1615-20, which, though not among the largest, is one of the handsomest in Europe. The façade is 147 feet wide, its depth is 110 feet, and in the centre 152 feet high; there is a print of it by Solomon Kleiner. Holl built also several churches, and the castle or palace of Schönfeld, and the palace of Willbadsberg at Eichstätt. He died in 1636, aged sixty-three.

HOLLAND, HENRY RICHARD VASSAL FOX, LORD, was the only son of Stephen, second Lord Holland. His mother was Mary, daughter of John Fitzpatrick, first Earl of Upper Ossory.

Sir Stephen Fox, Knight, distinguished for his magnificence and public spirit, as well as for his great wealth, having, in 1703, at the age of seventy-six, married a second wife, Christian, daughter of the Rev. Charles Hope of Naseby in Lincolnshire, had by her, besides a daughter, two sons, Stephen and Henry, and died in 1716 at the age of eighty-nine. Stephen became Earl of Ilchester; and Henry, who figures in our political history as the rival of the first Pitt, was, in 1763, raised to the peerage as Baron Holland, of Foxley, in the county of Wilts, his lady having the year before been made Baroness Holland, of Holland, in the county of Lincoln. Both baronies passed to their descendants. The eldest son of the first Lord Holland was Stephen, the second lord; his second son was the Right Hon. Charles James Fox, the celebrated orator and statesman.

The subject of the present notice was born at Winterslow House, in Wilts, the 21st of November 1773. On the 9th of January 1774, that mansion, a splendid building, was destroyed by fire, and the infant was with difficulty saved from the flames by his mother. On the first of July the boy lost his grandfather, the first Lord Holland; on the 24th of the same month, his grandmother Lady Holland; and on the 26th of December in the same year, his father, the second Lord Holland; on which he succeeded to the peerage, when he was little more than a year old. His mother died in 1778, and then the care of the child's education devolved on her brother, the Earl of Upper Ossory. After having been for some time at a school in the country, he was sent to Eton, where he spent eight or nine years, and where George Canning, Mr. Frere, the late Lord Carlisle, and other persons who subsequently rose to distinction, were among his contemporaries and associates. In October 1790 he was entered as a nobleman at Christchurch, Oxford; and took the honorary degree of master of arts, in right of his rank, in June 1792.

Before leaving the University he made his first visit to the Continent, in the course of which he saw Copenhagen, Paris, and a part of Switzerland. He arrived in France not long after the death of Mirabeau, and soon after the acceptance of the Constitution, by Louis XVI. after being brought back from Varennes, which was on the 13th of September 1791. In March 1798 he went abroad a second time, and, France being now closed, directed his course to Spain, over a great part of which country he travelled, studying the language and literature, and making himself acquainted with the character and manners of the people. From Spain he proceeded to Italy; and there, at Florence, in the beginning of the year 1795, first met Lady Webster, the wife of Sir Godfrey Webster, with whom he returned to England in June 1796, and whom he married the next year, after she had been divorced from her first husband, who obtained 6000*l.* damages in an action against Lord Holland. (See the particulars in the 'Annual Register' for 1797, pp. 10, 11.) After his marriage with Lady Webster, Lord Holland assumed, by sign manual, her family name of Vassal, which however has been laid aside by his children.

He now took his place in the House of Lords. His first speech was made on the 9th of January 1798, on the motion for committing the bill for trebling the assessed taxes. He addressed the house both early in the debate, and again at the close, in what is described as having been a very animated and successful reply to Lord Grenville, who, while he complimented the young peer on the ability with which he had spoken, had noticed some of his remarks in a way that was considered to be personal. On the division, nevertheless, Lord Holland found himself one of a minority of six against seventy-three; so that he had early and emphatic experience of the position in which he was to pass the greater part of his political life. He began also on this occasion a system which he probably carried to a greater extent than any other peer ever did, by entering a long protest against the bill on the Journals of the House. This first of Lord Holland's long series of protests, many of them very able papers, was signed only by himself and Lord Oxford.

From this date Lord Holland took a frequent part in the debates for the next four years, being all this time one of the steadiest opponents of the administration, and seconding in the Upper House the principal efforts of his uncle Charles James Fox in the Commons. Among other measures which met with his opposition was the Union

with Ireland, which he contended (8th May 1800) would both impoverish that country and endanger the constitution of England. A few days before this (on the 30th of April) he had moved that the penal laws against the Roman Catholics should be taken into consideration by a committee of the whole house. This motion, the first of the kind that had been made in the Lords, was got rid of by the previous question without a vote.

Meanwhile, in 1800, before the war was suspended, he had paid a visit to Germany, and returned from Dresden by Cologne and Brussels, having obtained a French passport from Talleyrand, and liberty to make use of it from Lord Grenville, then foreign secretary. In the summer of 1802, after the conclusion of the peace of Amiens, he repaired, with Lady Holland, to Paris, and was there soon after joined by Mr. Fox, along with whom he was introduced to the first consul. From Paris, Lord and Lady Holland proceeded through France to Spain, and they remained in that country till after the breaking out of the war with England in January 1805, returning home through Portugal by means of passports obtained through the Prince of the Peace.

He now resumed his attendance in the House of Lords; and his name, as before, appears frequently in the reported debates. He was not admitted to office during the ministry of Mr. Fox and Lord Grenville (January—September 1806); but on the 28th of August he and Lord Auckland were appointed joint-commissioners and plenipotentiaries for arranging and settling the several matters in discussion between this country and the United States, with Mr. Munro and Mr. Pinckney, the United States commissioners; and on the 27th of the same month he was sworn of the privy council. An arrangement of the differences with America was effected after a long negotiation (with the omission however of the impressment question); but Mr. Jefferson refused his ratification, and it came to nothing. On the 15th of October, after the death of Mr. Fox, Lord Holland was appointed lord privy seal; and he held that office for the six months longer that the Grenville ministry lasted.

In 1806, Lord Holland became an author by the publication of 'Some Account of the Life and Writings of Lope Felix de Vega Carpio,' in an octavo volume. This work, which was republished in 1817, when it was extended to two volumes by the addition of an account of Guillen de Castro and other matter, was creditable to his lordship's taste and familiarity with the more popular parts of Spanish literature, without being very learned or profound. Lord Holland followed up his life of Lope de Vega the next year by another octavo volume entitled 'Three Comedies from the Spanish,' and in 1808 he edited and introduced by a preface of some length Mr. Fox's fragment entitled 'A History of the Early Part of the Reign of James the Second.'

On the breaking out of the Spanish insurrection in this last-mentioned year, he hastened once more to visit the peninsula; and he remained there till the latter part of the year 1809. The rest of his public life for many years was a continuation of the same course of opposition to the policy of the government with which he had set out on his entrance into parliament. He took a leading part in most of the great questions that came before the House of Lords, and distinguished himself by his support of Sir Samuel Romilly's law amendments, by his advocacy of Catholic emancipation and his opposition to the orders in council, the cession of Norway and the detention of Bonaparte at St. Helena. However opinion may differ as to the wisdom of his politics, the praise at least of consistency cannot be refused to him. He was one of the steadiest Whigs of the school of Mr. Fox. But in those days the boundaries of party were much more clearly marked than they are now, and almost the only sort of inconsistency that was possible was going over openly from the one camp to the other, changing from Whig to Tory or from Tory to Whig.

When the unsuccessful attempt was made through the Marquis of Wellesley to effect a union of parties in January 1811, it was proposed that in the new ministry to be formed upon that principle Lord Holland should occupy the post of first lord of the Admiralty. Like the majority of his party, he supported without joining the ministry of Mr. Canning in 1827. In 1828 he made what has been described as his best speech in introducing the bill for the repeal of the Test and Corporation Acts to the House of Lords. At last, on the accession of the Whigs to power in November 1830, he became once more a cabinet minister as chancellor of the Duchy of Lancaster; and this office he held (with the exception of the ministerial interregnum of a fortnight in May 1832, and Sir Robert Peel's four months' tenure of power from December 1834 to April 1835) till his death at Holland House on the 22nd of October 1840. He was succeeded in his titles by his son, the present Lord Holland.

The only performances which Lord Holland sent to the press besides those already mentioned were 'A Letter to the Rev. Dr. Shuttleworth in favour of the Catholic Claims,' 8vo, London, 1827, and 'A Letter from a Neapolitan to an Englishman,' which is stated to have been privately printed in 1818, and to have been written to clear up some misconception by Murat of a conversation which his lordship had had with him. But since his death his 'Foreign Reminiscences,' 1 vol. 8vo, 1850, have been given to the world by his son, Henry Edward, the present Lord Holland. For the reputation of Lord Holland this book would have been well left unpublished. It is utterly deficient in everything like largeness of view, while on the other hand it shows

a strange fondness for the collection of scandalous anecdotes, especially if the scandal be of a prurient nature, and affect the credit of ladies connected with those to whom Lord Holland or his party have been opposed in sentiment or politics. Happily however for our common nature, many of the stories are of a kind to which it is almost impossible to give credence, and the mischievous effects of those which bear a greater semblance to truth, though perhaps equally untrue, are to a great extent neutralised by the palpable carelessness of their author as to the source from which they are obtained. Another work, of which however only the first two volumes, 1852-54, have as yet appeared, under the editorial care of the present Lord Holland, is 'Memoirs of the Whig Party during My Time, by Henry Lord Holland.' Though free from the worst faults of the preceding volume, and containing some things which will cause it to be referred to by the future student and historian of the period of which it treats, it is a work of a low intellectual and moral tone, and displays very little literary skill. The 'Memorials and Correspondence of Charles James Fox,' edited by Lord John Russell, includes the materials of Lord Holland's much-talked-of and long-projected life of his illustrious uncle; but they merely serve as evidence that Lord Holland had himself made but very little progress in his self-imposed task: the passages written by Lord Holland are contained in the first volume, and are marked 'V. H.' The posthumous publications of Lord Holland, it must be confessed, have done very little to sustain the literary and intellectual prestige which during his life had been so liberally accorded to him. Lord Holland is also the author of a translation of Ariosto's Seventh Satire, which Mr. Stuart Rose has printed in an Appendix to the fifth volume of his translation of the 'Orlando Furioso' (1827).

As a speaker, Lord Holland was more animated than graceful; when he began, in particular, he was usually for some time extremely impeded and embarrassed; and he never rose from this hesitation into anything like the free and impetuous torrent of argument, or the impassioned declamation, by which his relative Mr. Fox, after a similar unpromising outset, used to carry everything before him. But his speaking had always the charm of honesty and earnestness; and it commonly also indicated, with however little of what could be called brilliancy, a well-informed mind. Lord Holland was much beloved by as extensive and varied a circle of friends as perhaps any man ever possessed; and his house at Kensington, interesting from its earlier history, was during all his lifetime the resort of persons distinguished both in the world of politics and in that of literature.

HOLLAND, HENRY, born about 1746, holds a high rank among the architects of his own time, and was greatly patronised by George IV. when Prince of Wales. But we have no information as to his personal history; and his finest work, the portico of Carlton House, has passed away. This portico erected about 1784 was a fine specimen not merely of the Corinthian order, but of the Roman Corinthian style, in its full and uniform luxuriance, every part of it being highly finished up; and not only was the frieze of entablature enriched with sculpture throughout—with one exception, and that by Holland himself, the only instance of such classical decoration among the whole of our modern classical porticoes—but even the very bases of the columns were enriched with carving, a species of adornment by no means thrown away, since, being so near the eye, it challenged direct and minute observation. The Ionic colonnade screen in front of Carlton House was censured at the time, not for its real deficiencies, but as an architectural absurdity in itself. It was objected as a conclusive argument against it, that the columns supported nothing, whereas they were essential for the support of their entablature, and the entablature was requisite for connecting together the two gateways. While Carlton House and its fine portico have disappeared without being recorded by any engravings intended as adequate architectural studies of them (those in the 'Illustrations of the Public Buildings of London' being both too few and upon much too small a scale to serve such purpose), another work of Holland's, for the same royal patron, and which has also disappeared, though in a different manner—namely, the Pavilion at Brighton, as it existed previously to its being transformed into its present shape by Nash—has, unluckily for the credit both of the architect and his princely employer, been preserved in Richardson's 'New Vitruvius Britannicus.' As a residence for the Duke of York, Holland altered Featherstonehaugh House, Whitehall (built by Paine), adding to it the elliptical entrance-hall, on what was originally the court-yard, and the screen façade towards Whitehall.

Holland erected old Drury-Lane Theatre, that is, the structure which was begun in 1791 and burnt down in February 1809; and which was considerably larger than the present one, their respective dimensions being 320 × 155 and 240 × 135 feet; yet, except for its extent and loftiness of mass, the edifice made scarcely any pretensions to architecture externally. He was also the architect of another building in the metropolis of considerable architectural distinction, the India House, Leadenhall-street, the credit of which has, rather strangely, been generally given to Richard Jupp, who was only the Company's surveyor, and the conductor of the works; the design, and consequently the architecture, belonging to Holland. And the design is in some respects unusually florid in character, the frieze of the portico (a recessed Ionic hexastyle loggia) being highly enriched, like that of Carlton House, the pediment filled in with sculpture, and its serotera surrounded by colossal emblematical statues. All the rest

of the façade however is by much too plain and undignified to accord with such degree of embellishment confined to the centre of it, and the rustication of the ground-floor, showing merely horizontal joints, will bear no comparison with that classical mode of such decoration which was exhibited by him in the façades of Carlton House and Dover House. The entablature of the portico is suppressed elsewhere, the cornice alone being continued along the rest of the front, for which there is some reason, since otherwise the cornices of the windows would have joined the architrave. Holland also made some alterations in the mansion built by Brown at Claremont, and added the colonnade screen wings to the Assembly Rooms at Glasgow.

He died at his house in Hans Place, Sloane-street, Chelsea, on the 17th of June 1806, aged about sixty; he therefore did not live to witness the destruction of his Drury Lane by fire, and that of Carlton House, his finest work, by demolition.

* HOLLAND, SIR HENRY, BART., a distinguished physician, the son of the late Peter Holland, Esq., of Knutsford, Cheshire, by a daughter of the Rev. William Willetts, of Newcastle-under-Lyne, was born October 27, 1788. He received his early professional education at the University of Edinburgh, where he graduated M.D. in 1811. Having afterwards settled in London, he commenced practice as a physician, and soon succeeded in gaining for himself a high reputation. In August 1840 he was appointed Physician in Ordinary to H. R. H. Prince Albert, and in December 1852 Physician in Ordinary to Her Majesty. Sir Henry Holland is also a Fellow of the Royal Society and a Fellow of the Royal College of Physicians in London. He is well known as the author of a standard professional treatise entitled 'Medical Notes and Reflections.' Sir Henry Holland was raised to a baronetcy in 1858 in recognition of his eminent services as a physician. He has been twice married; his present wife is Saba, daughter of the late Rev. Sydney Smith, canon of St. Paul's, and authoress of a very pleasing life of her father.

HOLLAND, PHILEMON, was born at Chelmsford in 1551, and educated there and at Trinity College, Cambridge, of which he became a Fellow. Afterwards he was elected master of the Coventry free-school, where he undertook those laborious versions of the classics which have given him a respectable name in literature. He is, to the best of our knowledge, the first English translator of Livy, Suetonius, and Plutarch's 'Morals,' and the only English translator of Pliny's 'Natural History,' and Ammianus Marcellinus. He also translated Xenophon's 'Cyropædia,' and Camden's 'Britannia.' In addition to all this he found time to study and practise physic with considerable reputation, and reached the age of eighty-five, after a most laborious life, with unclouded faculties, having gone on translating till he was eighty years old.

HOLLAND, SIR NATHANIEL DANCE, [DANCE.]

HOLLAR, WENCESLAUS, was born at Prague, in Bohemia, in 1607. He was first intended for the profession of the law; but partly from disinclination to that pursuit, and partly from the ruin of his family after the taking of Prague in 1619, his views in life became changed, and he took to drawing and engraving. He had some instructions from Matthew Marian, an engraver who had worked under Vandyke and Rubens, and who is thought to have taught Hollar that peculiar manner which marks the working on his plates.

Hollar was but eighteen when the first specimens of his art appeared. These were a print of the 'Ecce Homo,' and another of the Virgin, both small plates, with a Virgin and a Christ after Albert Dürer, with Greek verses at the bottom of the plate, executed in 1625. He removed from Prague in 1627. During his stay in different towns of Germany he copied the pictures of several great artists, and took perspective views and draughts of cities, towns, and countries, by land and water, which in delicacy and miniature beauty were exceeded by no artist of his time. His views along the Rhine, the Danube, and the Neckar gained him his greatest reputation. In 1636, Howard, earl of Arundel, met with Hollar, when proceeding on his embassy to Ferdinand II., and immediately took him into his retinue. Hollar attended him from Cologne to the emperor's court, and in this progress made several draughts and prints of the places through which they travelled. It was then that he took the view of Würzburg, under which is written "Hollar delineavit in legatione Arundeliana ad Imperatorem." He afterwards made a drawing of Prague which gave satisfaction to his patron.

After finishing his negotiations in Germany, Lord Arundel brought Hollar to England, where he was not confined to his lordship's service, but allowed to take employment from others. His prospect of Greenwich, which he finished in two plates, dated in 1637, was one of his first works in England. In 1639 he etched several portraits of the royal family for the work which was published descriptive of the entry into this kingdom of Mary de' Medicis, the queen mother of France, to visit her daughter Henrietta Maria. About 1640 he seems to have been introduced to the royal family, to give the Prince of Wales a taste for the art of design. In this year appeared his beautiful set of figures entitled 'Ornatus Muliebris Anglicanus, or the several habits of English women, from the nobilitie to the countrywoman, as they are in these times.' In 1641 were published his prints of King Charles and his queen. At the breaking out of the civil war Lord Arundel left the kingdom to attend upon the queen, and Hollar was left to shift for himself. From some unknown cause he soon became obnoxious

to the ruling powers, probably from his general acquaintance with the friends of his patron, who were mostly royalists, with some of whom he was made prisoner at the surrender of Basing House, in Hampshire, in 1645. Hollar however having some time after obtained his liberty, went over to the continent to the Earl of Arundel, who then resided at Antwerp, where he remained for several years, copying from that portion of his patron's collection which had been carried there, and in working for printers and publishers. It was at this time that his portraits from Leonardo da Vinci, Holbein, and other great masters, made their appearance. In 1652 he returned to England, and worked incessantly till the time of his death. The plates by him in the first and second volumes of the old edition of Dugdale's 'Monasticon,' in Dugdale's 'History of St. Paul's,' and in his 'Survey of Warwickshire,' sufficiently prove his industry. It would be endless to enumerate all the subjects he engraved. A map of Donegal, in Ireland, is one of the rarest. In 1669 he was sent to Tangier, in Africa, in quality of his majesty's designer, to take the various prospects there of the garrison, town, fortifications, and surrounding country: these he subsequently engraved. Several of the drawings taken at this time are preserved in the British Museum. They were purchased, together with numerous fine proofs of Hollar's best works, from his widow, by Sir Hans Sloane. Hollar's latest works are probably the plates in Thoroton's 'Antiquities of Nottinghamshire,' some of which remain unfinished. When Hollar was in his seventieth year he had the misfortune to have an execution at his house in Gardiner's Lane, Westminster: he desired only the liberty of dying in his bed, and that he might not be removed to any other prison than his grave. Whether this was granted to him or not is uncertain, but he died March 28th, 1677, and, as appears from the parish-register of St. Margaret's, was buried in New Chapel-yard, near the place of his death. No monument was erected to his memory. Groom, from information he received from Oldys, has recorded that Hollar used to work for the booksellers at fourpence an hour, always having an hour-glass placed before him; and that he was so scrupulously exact, that even whilst talking, though with the persons for whom he was working, and upon their own business, he constantly laid down the glass to prevent the sand from running. His works, according to Vertue's catalogue of them, amount to nearly 2400 prints. In drawing the human figure Hollar was defective; and he failed in a few plates which he attempted to execute with the graver only.

* HOLMAN, JAMES, known as 'The Blind Traveller,' was born in or about the year 1787. He entered the royal navy in December 1798, and was appointed lieutenant in April 1807. At the age of twenty-five an illness which resulted from his professional duties deprived him entirely of his sight. On the 29th of September 1812, he was appointed one of the Naval Knights of Windsor, of whom there are six, with a governor. By degrees, when he had become accustomed to his condition, in 1819, partly the state of his health and partly a desire for change induced him to set out on a journey to the continent, of which he published an account in 'The Narrative of a Journey undertaken in the Years 1819, 1820, 1821, through France, Italy, Savoy, Switzerland, parts of Germany bordering on the Rhine, Holland, and the Netherlands; comprising Incidents that occurred to the Author, who has long suffered under a total Deprivation of Sight, by James Holman, R.N. and K.W.,' 8vo, 1822. On the 19th of July 1822, he embarked on a voyage to St. Petersburg, whence he proceeded to Moscow, Novgorod, and finally to Irkutsk, the capital of Eastern Siberia. His intention was, when the ice on Lake Baikal became sufficiently firm, to have crossed over, and travelled through Mongolia and China. At Irkutsk however an order was received by the Russian authorities from the Emperor Alexander, prohibiting him from proceeding any farther, and he was compelled to return. He was accompanied by a Russian officer to the frontiers of Germany, and was treated with external politeness combined with much harshness and severity. After his return to England he published 'Travels through Russia, Siberia, Poland, Austria, Saxony, Prussia, Hanover, &c., during the Years 1822, 1823, and 1824, while suffering from total Blindness, and comprising an Account of the Author being conducted a State Prisoner from the Eastern Parts of Siberia,' 2 vols. 8vo, 1825.

Mr. Holman's 'Travels through Russia' were intended, as he states, to have been the commencement of a series of travels and voyages round the world, which he afterwards accomplished, and which occupied about five years. After his return he published 'A Voyage round the World, including Travels in Africa, Asia, Australasia, America, &c., from 1827 to 1832,' 4 vols. 8vo, 1834. In this 'Voyage' he visited first the islands of Madeira, Teneriffe, and the western coast of Africa; thence he crossed the Atlantic to Rio Janeiro, and went to the gold-mines. After travelling some time in Brazil, he recrossed the Atlantic to the Cape of Good Hope, and visited Caffirland, Madagascar, Mauritius, and Ceylon, whence he passed to Hindustan. He next passed by the Straits of Malacca to New South Wales, Van Diemen's Land, and New Zealand, and returned round Cape Horn to England. In 1848 he visited Dalmatia, Montenegro, Bosnia, and Servia, and passed in 1844 by Moldavia into Transylvania. Lieutenant Holman's series of voyages and travels excited much interest when they were published, chiefly from the extraordinary circumstance of their having been accomplished by a man who was totally blind, but they are, as might be expected, of little value for any information which they contain.

HOLSTENIUS, the Latinized name of LUCAS HOLSTE, born at Hamburg in 1595, became one of the first scholars of his time. After travelling through Italy, England, and other countries, he settled at Paris, where he became acquainted with the brothers Dupuy, Peiresce, and other learned men. At Paris he embraced the Roman Catholic religion, in consequence, he said, of his deeply studying the works of the Fathers, and of his seeking for the principle of unity in the Church. Peiresce introduced Holstenius to the pope's nuncio, Cardinal Barberini, the nephew of Urban VIII., whom he accompanied to Rome in 1627. From that time he lived in the cardinal's house, became his librarian, was made canon of St. Peter's, and lastly librarian of the Vatican. He was sent on several missions to Germany, among others, to Innspruck, to receive the abjuration of Queen Christina of Sweden. He was also instrumental in effecting other conversions to Catholicism. Holstenius died at Rome in February 1661, leaving his patron, Cardinal Barberini, his universal legatee. He had collected a vast quantity of scarce books and manuscripts, and he left many works of his own in an unfinished state. With much application and a great desire of knowledge, he wanted perseverance, and was apt to suddenly desert one branch of study for another. Among his published works are the following:—1, 'Porphyrii liber de Vita Pythagoræ,' Rome, 1680, with a Latin version and notes, and a dissertation on the life and writings of Porphyrius, which has been considered as a model of learned biography; 2, 'Demophilii, Democratæ, et Secundi Veterum Philosophorum Sententium Morales,' Leyden, 1688; 3, 'Nota in Sallustium Philosophum de Diis et Mundo;' 4, 'Observationes ad Apollonii Rhodii Argonautica;' 5, 'Arrianus de Venatione,' with a Latin version; 6, 'Adnotationes in Geographiam Sacram Caroli à S. Paulo, Italiani Antiquam Cluverii, et Thesaurum Geographicum Ortelii;' 7, 'Notæ et Castigationes Posthume in Stephani Byzantini de Urbibus,' edited by Ryckius; 8, 'Liber Diurnus Pontificum Romanorum,' a collection of papal acts and decrees. He also wrote a collection of the rules of the earlier monastic orders, which was published after his death; and he edited in his lifetime the 'Antiquities of Præneste,' by Suares. Many of his Latin letters have been also published. His life was written by N. Wilkins, Hamburg, 1723.

HOLT, SIR JOHN, lord-chief-justice of the King's Bench, was the eldest son of Sir Thomas Holt, Knt., a bencher of Gray's Inn, and a gentleman of property in Oxfordshire. Sir John Holt was born at Thame in Oxfordshire, on the 30th of December 1642, and after spending some years at the free-school of Abingdon was in his sixteenth year entered as a gentleman commoner at Oriol College, Oxford. His college life appears to have been unusually wild and licentious; but like his predecessor in the King's Bench (Sir Matthew Hale), he discarded his irregular habits, and became remarkable for diligence and application. In 1652, before he was ten years old, he had been entered upon the books of the Society of Gray's Inn, and on the 27th of February 1663 he was called to the bar, and rose rapidly into notice as a first-rate lawyer and successful advocate. He was employed in most of the state trials which the troubled times in which he lived produced, and was generally counsel on behalf of the accused. His opposition to the measures of the court brought upon him the vengeance of James II., who procured his removal from the recordership of London. Shortly after the accession of William III (April 1689) Sir John Holt was made lord-chief-justice of the King's Bench, in which situation he continued during the remainder of his life, although the chancellorship was offered to him on the removal of Lord Somers in 1700. Sir John Holt in the discharge of the duties of his office evinced great resolution in opposing the encroachments as well of the crown as of the houses of parliament. His demeanour towards prisoners presented a noble contrast to the intemperance, brutality, and vulgar ribaldry which had disgraced the criminal proceedings of former reigns, and he set an example of spirit and temper which has continued to distinguish and adorn the judicial bench of England.

It was the fortune of Sir John Holt to be placed more than once in a position to bring into a striking point of view the personal intrepidity of his character, one instance of which, arising from the claims of privilege by the House of Commons, may be here mentioned. It occurred in the famous case of the Aylesbury burgesses, several of whom claimed damages against the returning officer who had refused to record their votes. The House of Commons resolved that the plaintiffs were guilty of a breach of privilege, and committed them to Newgate; but they sued out writs of Habeas Corpus, and the chief-justice was of opinion they were entitled to their discharge. Upon this the House of Commons issued warrants for the apprehension of the counsel who had argued for the burgesses, and sent the serjeant-at-arms to Sir John Holt to summon him to appear at the bar of the house. The chief-justice bade him begone, upon which the house sent a second message by their speaker, attended by as many members as supported the measure. After the speaker had delivered his message, Sir John Holt is reported to have said, "Go back to your chair, Mr. Speaker, within this five minutes, or you may depend upon it I will send you to Newgate. You speak of your authority; but I will tell you I sit here as the interpreter of the laws, and a distributor of justice, and were the whole House of Commons in your belly, I would not stir one foot." The accuracy of this reply has been questioned, but it has been extensively stated, and from the spirited

observations made by Sir John Holt whenever the due course of law or justice was attempted to be impeded, it is probable that his anger at the interference of the House of Commons would be shown by pretty strong language.

Sir John Holt died in March 1709-10, leaving behind him a reputation for learning, honour, and integrity, which has never been surpassed even among the many eminent individuals who have succeeded him in his dignified office.

HOLZER, JOHANN EVANGELIST, a distinguished German fresco-painter of the early part of the 18th century, was born at Burgeis, near Marienberg in Vintschgau, in the Tyrol, in 1709. His father was miller to the Benedictine Convent of Marienberg, and Holzer was first introduced by N. Auer at Meran in the Tyrol. He made here such extraordinary progress, that at the early age of eighteen his reputation spread far into Germany, and he was invited by the painter, J. A. Mers, to Straubing in Bavaria, to assist him in some frescoes in the convent church of Oberalteich. From Straubing Holzer went to Augsburg, where he lived six years in the house of J. G. Bergmiller, the principal painter in Augsburg at that time, from whom he learnt much in the mechanical department of painting, both in fresco and in oil. Holzer painted many excellent frescoes upon the exteriors of houses in Augsburg, but few, if any, now remain; there is however a collection of twenty-eight prints after them by J. E. Nilson, entitled 'Picture a Fresco in *Ædibus Augustæ Vind.*, a J. Holzer,' &c. Among these frescoes, a peasant dance, upon the façade of a beer-shop, was a very popular work; and it is spoken of in the highest terms in the letters of J. L. Bianconi and Count Algarotti: the figures were above the size of life. Holzer's greatest works however are the frescoes of the Benedictine church of Schwarzach near Würzburg; he obtained the commission to execute them by competition; and they were painted in 1737, when he was only twenty-nine years of age. They are the best works that were executed at that time in Germany; and Holzer is by some considered the founder of the new era of German fresco-painting. They are however now in a most dilapidated condition; the church is in a ruinous state, and the convent is a paper-mill. Holzer painted the cupola and ceiling of the church; the subjects represented are—the 'Glorification of St. Benedict;' the 'Transfiguration of Christ;' the 'Martyrdom of St. Sebastian;' 'St. Felicitas and her Seven Sons;' the 'Foundation of the Convent;' and the 'Papal Confirmation of the Foundation.' The 'Martyrdom of St. Sebastian' is described as the most successful composition.

After the completion of these works, Holzer was invited by the prince bishop of Würzburg to paint his palace, for which he made the designs, but they were not quite satisfactory to the bishop. He was in the meanwhile invited by the Elector Clement of Cologne to paint the newly-established capuchin convent at Clemenswerth, and he accordingly immediately prepared himself for this work. He however did not live to commence it; he died of a fever at Clemenswerth, a few days after his arrival, in July 1740, at the age of thirty.

Holzer's works are described as successful in every department of art, in invention, form, character, light and shade, and colour. He engraved a few plates. Several accounts of him have been published in Germany; the first in 1765, at Augsburg, and the last in the Tyrol in 1834.

HOME, HENRY (Lord Kames), was born at Kames, in the county of Berwick, in 1696. He was originally bound to a Writer to the Signet, but by diligent study he qualified himself for the higher practice of an advocate. His first work, entitled 'Remarkable Decisions in the Court of Sessions,' which appeared in 1728, excited considerable attention. The reputation of Mr. Home was still further established by the publication of his 'Essays on Several Subjects in Law.' In 1741 he published, in 2 vols. fol., 'Decisions of the Court of Sessions,' which were arranged under heads in the form of a dictionary; and in 1747 appeared his 'Essays on Several Subjects concerning British Antiquities.' In his 'Essays on the Principles of Morality and Natural Religion,' while he worked out extensively the principle of a moral sense as taught by Lord Shaftesbury, he opposed all exclusive theories of human nature which derive all the actions of men from some single principle, and endeavoured to establish several general principles. Some of the propositions advanced by him concerning natural religion however gave considerable offence. In 1752 Mr. Home was appointed a judge of the Court of Session, and took his seat on the bench by the title of Lord Kames. At the same time he was nominated a trustee for the encouragement of manufactures, fisheries, and arts, and also commissioner for the management of forfeited estates. But the activity of his mind was far from being exhausted by his numerous official duties, and he found leisure to compose two important works, in which he attempted to apply to the science of jurisprudence the principles of philosophy. The titles of these works are, 'Historical Law Tracts,' and 'The Principles of Equity.' In 1761 he published an 'Introduction to the Art of Thinking,' for the use of youth, which as an elementary work has been highly esteemed. The year following there appeared 'Elements of Criticism,' 3 vols. 8vo, which were greatly admired at the time, and which perhaps still find readers. In 1763 he was appointed one of the lords commissioners of the judiciary; but his literary labours were still uninterrupted by the growing weight of duty and of years, and in 1774 he published

BIOG. DIV. VOL. III.

'Sketches of the History of Man,' 2 vols. 4to, an amusing work, but full of fanciful ideas, and resting on facts of very doubtful authority. In 1776 appeared 'The Gentleman Farmer, or an Attempt to improve Agriculture by subjecting it to the test of Rational Principles.' This treatise is even now referred to by writers on agriculture, and was not without its influence in effecting the present improved state of Scotch farming. His last work, entitled 'Loose Hints on Education,' was published in the eighty-fifth year of his age. He died on the 27th of December 1782. (*Life of Lord Kames*, by Lord Woodhouselee.)

HOME, or HUME, JOHN, was born in Scotland about the year 1722, and is supposed to have been a relation of David Hume. He was bred to the ministry of the Kirk, and subsequently nominated to the parish of Athelstanford, where he produced his tragedy of 'Douglas,' which was acted at Edinburgh with unbounded applause. Perhaps there was scarcely ever a composition more harmless; but the circumstance of its being a drama was enough to draw down the anger of the rigid elders of the Kirk, who were shocked to find such a work proceed from the pen of a minister. Not only was he compelled to retire from the ministry, but even those of his friends who might visit him or go to see the performance of his piece were denounced. Home retired to England, where he received the protection of the Earl of Bute, and obtained a pension. The play of 'Douglas' has kept its place on the stage, and from its purity of style and language, and interesting plot, will probably continue a favourite. Four other tragedies—'Agis,' 'Aquilina,' 'The Fatal Discovery,' and 'Alonso'—followed 'Douglas,' but they did not equal it, and have been long since forgotten. Home died in 1808.

HOMER (in Greek, *Homeros*), the supposed author of the earliest Greek heroic poems extant, and of some hymns in praise of different gods. Opinions the most various have been held regarding his birth-place, his age, his station, and the circumstances of his life; so that it seems almost hopeless to come to any satisfactory conclusion on subjects which history has given us such scanty materials to determine. The author or authors of the 'Iliad' must have been accurately acquainted with the geography of Greece and the northern part of the archipelago. Leake notices several instances where epithets are applied with an exactness which seems to indicate personal knowledge of the places; and as these places are in different parts of Greece, we may infer that Homer was a wandering minstrel. The existence of such wandering minstrels seems to be shown by the 'Hymn to Apollo,' quoted by Thucydides; as the notices of Phemius and Demodocus, in the Homeric poems, prove the existence of bards attached to particular courts; and indeed, without this information, the analogy of our own heroic age would render it highly probable that there should have been an order of wandering minstrels, while in a country like Greece, inhabited by kindred though often hostile tribes, it would be impossible for a wandering musician to recite the same tales at every court and before every audience. Either he must have had contradictory accounts to retail according to the tribe among which he exercised his powers, if he exercised them on intertribal feuds at all, or, which is much more probable, considering the reverence in which national legends were held, he must have confined himself to subjects where the whole race could be contemplated as uniting against a common foe, or have resigned all claim to be considered an heroic bard.

Of these two plans, the author of the 'Iliad' adopted the former. The story of Helen was probably an Athenian legend, as we find that the Attic hero Theseus is reported to have stolen her when young. What then could be more natural than for a minstrel, particularly an Attic minstrel, to take this legend, and, combining it with others which gave some account of an expedition undertaken by the Greeks against Asia, produce the narrative which we find in the 'Iliad?' We do not insist on this method of accounting for the origin of the Homeric poems; all we wish to do is to illustrate the way in which they *might* have arisen, and to give what we think a rational exhibition of the causes, or some few of the more important of the causes, which led to the establishment of a national heroic epic in opposition to a cycle of poems referring to the exploits of particular tribes. Whatever be the origin of the 'Iliad,' it is peculiarly remarkable in standing as it does a witness of the unity of the Hellenic races. We find these races, historically speaking, opposed in every possible way, as rivals, as strangers, as enemies;—if we turn to their poetry, we find them united. The common Christianity of Europe is not a more strongly-marked bond of union than the common poetry of the Greeks, and this community must, in the Epic period particularly (wherein it is most strongly marked), be referred to that genius—whether in the author, or in the race for whom he composed, matters not—which has given birth to the 'Iliad.'

The poems attributed to Homer are the 'Iliad' and the 'Odyssey,' to which some have added the 'Homeric Hymns.' Of these poems, the 'Iliad' stands first, as the oldest and at the same time the completest specimen of a national heroic poem. Its subject, as is known to all, is the revenge which Achilles took on Agamemnon for depriving him of his mistress Briseis, during the siege of Troy, and the consequent evils which befel the Greeks. It is divided into twenty-four rhapsodies or books, which detail the history of the besieging force during the period of Achilles' anger, and end with the death of

Hector (who is slain by Achilles in retaliation for Hector's having killed Patroclus), and the solemn burial of the Trojan warrior. If any one reflects on the form which the first imaginative compositions of any people in an early stage of progress must take, and when he has ascertained, what he probably will ascertain, that those compositions, if not of a sacred nature, will bear reference to external and active life, goes on to apply his conclusions to the Greek nations in particular, and furthermore to the heroic age of the Greeks, he will doubtless find little difficulty in agreeing with a remark which has already been made regarding heroic poetry, namely, that as a simple form of art it does not imply the development of a plot, but rather the extraction of a certain portion from the poetical annals of a nation, beginning and ending just where the subject may seem to suggest, but not necessarily ending with a regular disengagement of a plot regularly worked up and studiously combined from the beginning of the poem. To apply this to the 'Iliad:' we shall see that it would be vain, not to say out of place, to aim at proving, as some have done, that the 'Iliad' is a poem constructed on regular principles of art. It is a poem of natural growth; the earliest and yet the noblest attempt made by the epic spirit in the most imaginative nation of which we have any record, and, as Thirlwall has remarked, perhaps the first work to which was applied the newly-invented art of writing. This last supposition, if adopted, would lead us to infer that the reason why the 'Iliad' has attained to a size much greater, as far as we can tell, than any earlier poems, is because Homer, seeing the art of writing in its rudest state already practised, was the first to apply it, as well as the first to supply extensive material for its application. Whether what we now possess be the exact poem which thus forms the beginning of all literature, properly so called, or not, is scarcely doubtful. The lapse of so many ages can hardly have failed to have introduced some passages, and altered and removed others, but whether to any great extent seems almost impossible to decide. Particular scholars may impugn particular passages, and themselves entertain no doubt of their own infallibility; but it behoves every one to remember that the same practice in style which would be necessary to enable a scholar to decide correctly on a passage of doubtful authenticity would, unless that scholar's ingenuity were under perfect control, be very likely to suggest difficulties and questions too tempting for his judgment to resist. But the same spirit of criticism which suggested these doubts has also suggested others, as it would seem, on better foundation: we mean those relating to the authorship of the 'Odyssey.' Before entering on this question, it will be as well to observe that the 'Odyssey' can hardly be called a national epic. It is much nearer the romance of chivalry than any other ancient work. It contains the account of those adventures which Ulysses encountered on his way home from Troy, and in its present state consists of twenty-four books, which division is said to be owing to the grammarians in the time of the Ptolemies. Nitzsch ('Anmerkungen,' vol. ii. p. 34) divides the 'Odyssey' into four parts, ending with the 4th, the 92nd line of the 13th, the 19th, and the 24th books respectively, and containing the story of the absent, the returning, the vengeance-planning, and the vengeance-accomplishing Ulysses; and he professes, as many others have done, to point out all the interpolations.

Our limits do not permit us to say more on this subject than to notice that there is little doubt that much has been interpolated in the account of Ulysses's visit to the shades, and that Aristophanes and Aristarchus the grammarians considered the latter part of the 23rd and all the 24th book spurious. It will be more to our purpose to consider the question whether the Iliad and Odyssey are or are not to be referred to the same author, and this we shall do rather more with the view of pointing out some important features in the discussion, than as hoping to arrive at any very definite result. A sect arose very early among the grammarians called 'The Dividers' (*oi χυσιγορες*), who denied to Homer the authorship of the Odyssey. The grounds of this opinion were mostly critical, such as the different use of different words in the two poems; or historical, such as contradictions, real or apparent, in points relating to Helen, Nelaus's sons, Aphrodite's husband, &c.; but we possess but little of the fruits of their researches, although enough, according to Grauert ('Rheinisches Museum,' l.), to show that they could not have belonged to the early childhood of criticism. In our day, or at least in that of our fathers, the question has been revived, with a power of suggesting doubts, as much greater as that of satisfying them is less. With regard to the argument from the use of different words in the two poems, both in ancient and in modern times, it must be observed that in the Iliad itself, compared with itself, there is, if anything, a more remarkable variety in the use of words than in the two poems. We do not remember to have seen the observation, but we think that any one who reads the Iliad, noting down any words which strike him, will find that no sooner has he got acquainted with a set of words than they disappear, and that this rising and setting of words continues all through the poem. If then the use of different words argues different authors, there will be some difficulty in escaping the conclusion that different books of the Iliad, as well as the two Homeric poems, were the production of separate authors. The different use of words however is a strong argument, but a stronger than all is to be found in the different state of civilisation which the two poems exhibit, and in the tendency which the Odyssey displays to exalt the

individual above the class, a tendency which proves that an advance had been made to that kind of poetry which treats of individual feeling, namely lyrical poetry. But there is one other characteristic of the Odyssey to which we have before slightly alluded, we mean its romantic look, using romantic as opposed to classical. There is something quite northern in the adventures of Ulysses; they might have happened to a knight of Arthur's court, or perhaps still better to Beowulf. The Sirens would be singing maidens, who decoy travellers by their strains; the nymph Calypso would find an anti-type in some enchantress. Ulysses slays the suitors, much in the way of William of Cloudeley, in the old ballad; and the horror of great darkness which the prophet sees surrounding the suitors is so like Sir W. Scott's description of the banquet at the end of the 'Lay of the Last Minstrel,' where the goblin-page is recalled, that we might suppose that it had suggested the scene, were we not almost certain that he had borrowed, consciously or unconsciously, from some northern story, if at all. To this we might add the charm in shape of a fillet, which Lenothee gives Ulysses ('Od.,' v. 346), the story of the Lotus-eaters, the tying up the winds in a bag ('Od.,' x. 19), a practice still in use among the Laplanders, and the ship of the Phœnicians,

"That asked no aid of sail or oar,
That feared no spite of wind or tide."

These grounds and others have impressed many modern scholars with the opinion that the Odyssey and Iliad are not the produce of the same mind. How far either poem can claim a single author is another question, and one which it is far less easy to solve. We have mentioned some of the arguments that have been urged, and to these we might add an historical analogy from the same kind of poetry in our own country. The great romances, some of them at least, were more than a century in their production, and one, the 'Romance of Alexander,' had, if we mistake not, at least a dozen contributors. Whether there be the same traces of unity of design in the two poems, we must leave to others; if not, the instance proves no more than it would to refer to the 'Mirror for Magistrates,' which contains more separate accounts than it had authors. Again, Henry the Minstrel, although blind, was the author of a poem which rivals the Iliad in length; so that it is not impossible that Homer, whether blind or not, should have composed and recited the whole Iliad, even without the aid of letters. Examples then lead in this case to no definite result, and if we attempt to base our conclusions upon them, we may be led with nearly equal probabilities to opposite results. But there is an historical fact which has been adduced in support of one side of this question, namely, the existence of a race of men called Rhapsodists, or Homerids, who imitated Homer, enlarged upon him, and interpolated his poems with verses of their own (Hermann, 'Preface to Homer's Hymns,' p. 7); treating him very much as the Bible was treated by one school of the early Mystery-mongers. Now those who deny the unity of the Iliad assert that these Rhapsodists manufactured it among themselves, until it gradually assumed that form in which Pausanias finally established it, and in which we now have it. The question then comes again to be one of taste. Those who think they see in the Iliad proofs of such unity of design as outweigh all the arguments brought from history and criticism, will have reason for considering the Iliad to be the work of one author far stronger than any which their opponents can possibly possess on the other side, inasmuch as the conviction of taste is always much more binding than a logical proof, especially one which only goes on probabilities. Each man who engages in the controversy will have it decided for him as much by his own natural character and bent as by argument; and here we may leave it, with this one remark, that the most which can be proved, even by the rules of taste, is that the great design and chief filling-up is by one author: individual lines or even whole passages may in any case be interpolations. On this part of the question the reader will find some very valuable remarks in Hermann's preface already quoted, which relate also to the opening lines of the Theogony, and more especially to those other poems which we now come to notice, the Homeric Hymns.

The Hymn to Apollo, as Hermann thinks, owes its present form to the fact of the last transcriber having had before him at least four hymns, each with a similar introduction, all which introductions, in transcribing, he mixed up together; and furthermore to his having mixed up two separate hymns, one to the Delian and one to the Pythian Apollo, of which the latter was itself composed of two, one to the Pythian and one to the Tiphussian Apollo. The Hymn to Hermes is very corrupt, consisting of a larger and a smaller hymn, and interpolations. The Hymn to Aphrodite and that to Demeter are also much altered; the latter, according to Hermann, bears marks of at least two editions. These are the principal of the Homeric hymns: the fragmentary one to Dionysius seems also to have been one of the larger and more important ones. There are twenty-eight shorter hymns given in Hermann's edition, as well as seventeen epigrams, or rather epigraphs. These, with the 'Battle of the Frogs and Mice,' make up the sum of the Homeric poems, genuine and spurious.

The earliest mention made of Homer is by Pindar. Herodotus and Thucydides quote and refer to him; and when we get to Plato he is constantly either hinted at or transcribed. There is a good deal of

information on this topic and others in Heyne's work already quoted; but we may quote Thirlwall's authority for the remark that "an argument which confines itself to the writings of Wolf and Heyne can now add but little to our means of forming a judgment on the question, and must keep some of its most important elements out of sight." A great deal more information is to be found, by those who will take the trouble to look for it, scattered up and down in the pages of German periodicals. Buttman's *Lexilogus* and Thiersch's *Grammar* supply critical matter in abundance. Creuzer's 'Symbolik und Mythologie,' Hermann and Creuzer's 'Letters on Homer and Hesiod,' Voss, Nitzsch, and K. O. Mueller, may be also studied with advantage, as well as vol. i, ed. 1845, of Thirlwall's 'History of Greece.'

The principal modern editions of Homer are, those by Clarke and Payne Knight, in this country (the latter having the digammas inserted in what the editor supposes to be their proper places), and abroad, Heyne, Bekker, Hermann, and Nitzsch, for the *Iliad*, *Hymns*, and *Odyssey* respectively. Of translations we have Hobbes, Chapman, Pope, and Cowper; but of these Pope's, the best known, is rather an imitation, not at all in the style of the original, than a translation. Perhaps, on the whole, Chapman's is the best. The German translation by Voss is perfectly wonderful as regards accuracy. It is in hexameters, and preserves every sentence and nearly every word.

HONDEKOETER, the name of a celebrated family of Dutch painters, of whom the founder, Egidius or Gilles Hondekoeter, born at Utrecht in 1583, was the son of a Marquis of Westerloo, a wealthy landowner in Brazil, who was obliged by the persecutions of the Inquisition to withdraw from his own country. He painted landscapes in the manner of Savery and Vinckenboems, in which he introduced fowls of different kinds, highly finished.

GYSBRECHT DE HONDEKOETER, his son, was born in 1613 at Utrecht. He was a skilful painter of domestic poultry, but was far surpassed by his son MELCHIOR DE HONDEKOETER, born at Utrecht in 1636. Till the age of seventeen Melchior was carefully instructed by his father, on whose death, in 1653, he studied for a time under John Baptist Weenix, his uncle. His representations of cocks, hens, ducks, peacocks, &c., excel in truth, life, elegance of design, and delicacy of execution, the works of all other painters of such subjects. His genuine pictures are held in high estimation, and fetch great prices. He died April 3, 1695, aged fifty-nine. One of Melchior's works, a beautifully painted group of 'Domestic Poultry,' is in the National Gallery.

HONE, WILLIAM, was born in 1779 at Bath, where his father is stated to have been an occasional preacher among the Dissenters. He is said to have been so rigid in his religious notions that he would not suffer his son to be taught to read out of any other book than the Bible. William was placed at the age of ten in an attorney's office in London; but after some time his father, finding that he had attached himself to some reforming society, and begun to take part in what he thought very objectionable politics, removed him to another master at Chatham, with whom he remained between two and three years. He then returned to London, and was engaged for some time as clerk to an attorney of Gray's Inn; but at last he quitted the law, and, having married, set up in July 1800 as a bookseller, with a circulating library, in Lambeth Walk. From this locality he removed to what was then called St. Martin's Churchyard, in the neighbourhood of Charing Cross; and there he appears to have remained stationary for several years, although it is stated that he was once burnt out, and also underwent many vicissitudes in business. He had always been fond of literature, and in 1806 he brought out his first publication, an edition of Shaw's 'Gardener.' After this he devoted much of his time to an attempt which he made in conjunction with a friend to establish a savings bank in Blackfriars-road, which however failed. He then entered into partnership as a bookseller with this friend, Mr. John Bone, but the speculation ended in bankruptcy. When he got upon his feet again he established himself in a shop in May's Buildings, whence he removed to High-street, Bloomsbury, and there he appears to have remained till 1811, when on the retirement of Mr. John Walker he was selected by the booksellers to be what is called the 'trade auctioneer,' and placed in a counting-house in Ivy-lane. Before this he had been employed to compile the Index to the new edition of Lord Borners's Translation of Froissart. But he had no genius for business, and, having now taken to the investigation of the abuses in lunatic asylums, he soon became bankrupt again. He had now seven children, whom he took to a humble lodging in the Old Bailey, and endeavoured for a time to support by contributing to periodical publications, especially the 'Critical Review' and the 'British Lady's Magazine.' At length however he found means to set up once more as a bookseller in a small shop in Fleet-street. Here he was again unfortunate in having his premises twice broken into and plundered, much of the stock that was carried off having been borrowed; but he seems to have weathered these disasters; and in 1815 he became publisher of the 'Traveller' newspaper. In that year he exerted himself with praiseworthy humanity and spirit in the investigation of the case of the unhappy Elizabeth Fenning, executed on a charge of poisoning of which there can scarcely be a doubt that she was innocent; and he published a very striking account of the case.

In 1816 he commenced a weekly paper called 'The Reformists'

Register;' but it does not seem to have gone on long. The next year however he brought himself into great notoriety by a series of political satires, published as separate pamphlets, which had immense success, the effect partly of their literary merit, partly also of the wood-cut embellishments from the humorous designs of Mr. George Cruikshank [CRUIKSHANK, GEORGE], whom they first made generally known to the public. One of them, 'The Political House that Jack Built,' went through fifty editions, besides producing a host of inferior imitations. Another, entitled 'A Slap at Slop,' was a scourging attack upon the since defunct daily morning paper called 'The New Times,' its editor Dr. (afterwards Sir John) Stoddart, and the Constitutional Association, or 'Bridge-Street Gang,' as Hone designated it. But those of the series that turned out the most productive for the author were three composed in the manner of parodies upon various parts of the Book of Common Prayer. For the printing and publishing of these parodies Hone was brought to trial on three several indictments in the Court of King's Bench, on the 18th, 19th, and 20th of December 1817; the first day before Mr. Justice Abbot (afterwards Lord Tenterden), the second and third days before Lord Ellenborough. He defended himself on all the three trials (which were before special juries); and, notwithstanding the best exertions of the bench to procure a conviction, was acquitted on each indictment. His address to the jury on the third day especially, which lasted seven hours and a half, when, although fatigued by his previous exertions, he was inspired by success, was remarkably effective. The feeling of the public was that the alleged libels were really prosecuted for their political tendency, and that if they had been on the other side of the question, written in defence of the ministry instead of in ridicule of it, they never would have been questioned. There is also, we believe, no reason to think, however objectionable their form may have been, that Hone had any design to bring religion into contempt.

His acquittal, besides the reputation which it brought him, was followed by the subscription of a considerable sum of money for his use, which enabled him to remove from Fleet-street to a large house on Ludgate-hill. But when he attempted to resume the business of a book auctioneer, he was even less successful than before. In 1823 he published the results of researches to which he had been originally directed with a view to his defence, in an octavo volume, entitled 'Ancient Mysteries Described, especially the English Miracle Plays founded on the Apocryphal New Testament Story, extant among the unpublished MSS. in the British Museum.' This is a curious work, not at all addressed to the multitude, or chargeable with any irreverence of design or manner, but treating an interesting antiquarian subject in the dispassionate style of a studious inquirer. It has now been nearly superseded by more elaborate works that have since appeared; but when it was produced it was by far the fullest account of our old miracle plays that had been given to the public. In 1826 Hone began the publication, in weekly numbers, of his 'Every Day Book.' The sale was large, but his family had now increased to ten children, and he again got into difficulties; the end of which was that he was arrested by a creditor and thrown into the King's Bench prison. Here he remained for about three years, during which time he finished his 'Every Day Book,' in 2 vols., and began and finished his 'Table Book,' in 1 vol., and also his 'Year Book,' in 1 vol. These three works, which may be considered as forming properly so many series of the same undertaking, are full of curious information, and will probably preserve the name of their compiler after everything else he did shall be forgotten.

The rest of Hone's life was a continuation of vicissitudes such as those to which he had been all his days accustomed. Sometime after he got out of prison a number of his friends attempted once more to establish him in the world as landlord of the Grasshopper coffee-house in Gracechurch-street; but after a few years this speculation also failed. He then having formed some acquaintances among members of the Independent connection, became impressed with religious views, united himself to an Independent church, and was persuaded to try his talents as a preacher: he appeared indeed frequently in the pulpit of the Weigh House Chapel in East Cheap. He had had an attack of apoplexy so long ago as in 1816; in 1835 he was struck by paralysis at this chapel; in 1837 he was again similarly attacked at the office of the 'Patriot' newspaper, of which he was then sub-editor; soon after he suffered another attack, from which he never recovered; and he died at Tottenham on the 6th of November 1842. We have mentioned his principal works, but he was the author of a good many more. His last publication was, we believe, an edition of Strutt's 'Sports and Pastimes of the English,' in 1 vol. 8vo, which appeared in 1838. But shortly after his death there was published a work entitled 'Early Life and Conversion of William Hone,' a narrative written by himself, edited by his son, William Hone. Hone was a warm-hearted but mild-tempered man, much misconceived by those to whom he was known only through his parodies, which he probably produced in mere thoughtlessness and innocence of heart. It is evident from the above sketch of his history that the unworldliness of his nature was such as is rarely met with.

HONORIUS, son of Theodosius the Great, and younger brother of Arcadius, was born at Constantinople in 354. After the death of his father in 395, Honorius had for his share the Empire of the West, under the guardianship of Stilicho, a distinguished general of the

imperial armies. Honorius fixed his residence at Milan. For several years after, Stilicho was the real sovereign of the West; and he also endeavoured to extend his sway over the territories of Arcadius in the East, under pretence of defending them against the Goths. He gave his daughter Maria in marriage to Honorius, and recovered the province of Africa, which had revolted. About the year 400 the Goths and the Huns, under Alaric and Radagaisus, invaded Italy, but were repelled by Stilicho. In the year 402 Alaric came again into Italy, and spread alarm as far as Rome, when Stilicho hastily collected an army, with which he met Alaric at Pollentia, on the banks of the Tanaro, completely defeated him, and obliged him to recross the Noric Alps. After this victory Honorius repaired to Rome with Stilicho, where they were both received with great applause. On that occasion Honorius abolished by a decree the fights of gladiators, and he also forbade, under penalty of death, all sacrifices and offerings to the pagan gods, and ordered their statues to be destroyed. In the year 404 Honorius left Rome for Ravenna, where he established his court, making it the seat of the empire, like another Rome, in consequence of which the province in which Ravenna is situated assumed the name of Romanica, Romaniola, and afterwards Romagna, which it retains to this day. In the following year Radagaisus again invaded Italy with a large force of barbarians, but he was completely defeated and put to death by Stilicho, in the mountains near Fesula, in Etruria. In the next year the Vandals, the Alani, the Alemanni, and other barbarians crossed the Rhine, and invaded Gaul. A soldier named Constantine revolted in Britain, usurped the imperial power, and, having passed over into Gaul, established his dominion over part of that country, and was acknowledged by Honorius as his colleague, with the title of Augustus. Stilicho now began to be suspected of having an understanding with the barbarians, and especially with Alaric, and Honorius gave an order for his death, which was executed at Ravenna in August of the year 408. [STILICHO.] His death however was fatal to the empire, of which he was the only remaining support. Alaric again invaded Italy, besieged Rome, and at last took it, and proclaimed the prefect Attalus emperor. Honorius meantime remained inactive and shut up within Ravenna. [ALARIC.] The continued indecision and bad faith of Honorius, or rather of his favourites, brought Alaric again before Rome, which was this time plundered, in 410. After Alaric's death his son Ataulphus married Placidia, sister of Honorius, and took possession of Spain. The rest of the reign of Honorius was a succession of calamities. The Empire of the West was now falling to pieces on every side, and in the midst of the universal ruin Honorius died of the dropsy at Ravenna, in August 423, leaving no issue.

Coin of Honorius.

British Museum. Actual size. Gold. Weight 65½ grains.

HONORIUS I., a native of Campania, succeeded Boniface V. as Bishop of Rome in 626, with the sanction of the Imperial Exarch of Ravenna. In 627 he sent the pallium to the archbishops of York and Canterbury, but he found great opposition among the Welsh clergy, who resisted the metropolitan authority assumed by these newly-appointed prelates, and the supremacy claimed by the bishops of Rome. Those members of the more ancient British Church differed also from Rome in their manner of computing Easter. Honorius held a correspondence with Sergius, patriarch of Constantinople, who favoured the doctrine of the Monothelites concerning the singleness of the will in Jesus Christ. [EUTYCHUS.] Two letters of Honorius to Sergius, which are preserved, contain passages apparently in favour of Monothelism, at the same time recommending not to dwell too much upon those subtle distinctions, for fear of creating scandal and schism. In the sixth Council of Constantinople the doctrine of Honorius on this subject was condemned as heretical. Bartoli, in his 'Apologia pro Honorio,' Baronius and others, have undertaken to refute the charge of Monothelism brought against Honorius. Fabricius, in his 'Bibliotheca Græca,' gives an accurate account of those who have treated of the history of Monothelism. Honorius died in 638, and was succeeded by Severinus.

HONORIUS II., CARDINAL LAMBERTO, Bishop of Ostia, was elected pope by the cardinals in 1124, after the death of Calixtus II., while most of the bishops assembled at Rome elected Tebaldu, cardinal of Santa Anastasia. Honorius was supported by the powerful family of the Frangipani; and the people being divided in opinion, Tebaldu, to avoid further strife, waived his claim, and Honorius himself is said to have expressed doubts concerning the validity of his own election until it was confirmed by the clergy and the people of Rome, which was consequently done. He refused the investiture of the duchies of Apulia and Calabria to Roger, count of Sicily; and Roger having besieged the pope within Benevento, Honorius excommunicated him; but afterwards peace was concluded between them, and Honorius

granted the investiture. He also confirmed the election of Lotharius as king of Italy, and excommunicated his rival Conrad. Honorius died at Ostia in 1130. His death was followed by a schism between two rival candidates, Anacletus and Innocent II.

HONORIUS III., CARDINAL CENCIO SAVELLI, succeeded Innocent III. in 1216. He employed himself zealously, but with no great success, in restoring peace among the Italian cities, which, having become independent of the German empire since the peace of Constance, seemed to have no other notion of enjoying their independence but by waging war against one another. Another object of the pope's efforts was that of persuading the Christian princes, and especially Frederick II., to undertake a great crusade against the Mussulmans in the East. Frederick promised everything, in order to be crowned, which ceremony was performed by the pope at Rome on the 22nd of November 1220; but afterwards Frederick, instead of proceeding to Palestine, tarried in Apulia and Sicily, in order to reduce those countries to complete submission. Honorius was meantime frequently at variance with the nobles and people of Rome, who drove him repeatedly from that city. After ten years of a very troubled pontificate, Honorius died in March 1227, and was succeeded by Gregory IX.

HONORIUS IV., CARDINAL GIACOMO SAVELLI, succeeded Martin IV in 1285. He showed great zeal for the cause of Charles of Anjou against the Aragonese, who had occupied Sicily; and he even preached a crusade against the latter, qualifying it as a 'holy war.' The Aragonese however stood firm, and defeated the French on several occasions. Honorius died in April 1287: he is said to have contrived, during his short pontificate, to enrich his family considerably. He was succeeded by Nicholas IV.

HONTHORST or **HUNDHORST**, GERHARD, called by the Italians **GHERARDO DALLE NOTTE**, from his night and candle pieces, was born at Utrecht in 1592. He was the pupil of A. Bloemart, studied some time in Rome, and was engaged for six months by Charles I. in England. He painted Charles's sister, the Queen of Bohemia: the portrait is now at Hampton Court. There are also at Hampton Court—James II., when young; the Duke of Buckingham and family; and a large painting, on the queen's staircase, of Charles I. and his queen, as Apollo and Diana, sitting in the clouds, and the Duke of Buckingham below, as Mercury, introducing the Arts and Sciences to them, while several genii are driving away Envy and Malice. For these paintings Honthorst received 3000 florins, a service of plate complete for twelve persons, and a beautiful horse. Honthorst was the favourite painter of the Queen of Bohemia, and he was the court painter to the Prince of Orange. He died at the Hague in 1660. He had a remarkable number of scholars, especially among the highest classes. Sandrart also was one of his pupils. His style of execution bears a certain resemblance to that of Guercino: his pictures occur frequently in European galleries. (Sandrart, *Teutsche Academie, &c.*; Walpole, *Anecdotes of Painting, &c.*)

HOOD, ROBIN. [ROBIN HOOD.]

HOOD, SAMUEL, VISCOUNT, was born December 12th 1724 at Butley in Somersetshire, of which parish his father was the incumbent. He was brought up to the navy, and after passing with credit through the inferior ranks of the service, was appointed in 1767 to command the Antelope, 50 guns, in which he took a French 50 gun ship. In 1759, in the Vestal, 32 guns, he was again successful in capturing the Bellona, a French frigate of equal force. He served in the Mediterranean, under Sir Charles Saunders, till the end of the war in 1763, and was appointed to command on the Boston station in 1763. In 1778 his services were rewarded with a baronetcy. In 1780 he was promoted to the rank of rear-admiral, and sailed with a squadron to the West Indies to join Sir George Rodney. Though only second in command, Hood found several opportunities to display his talents. On the 28th of April 1781 he encountered a superior French fleet under the Comte de Grasse, who, having the advantage of the wind, baffled the English admiral's attempts to bring him to a close and decisive engagement. By Rodney's departure to England at the end of July, Hood succeeded to the command of the fleet. The events of the war called him almost immediately to America. He fought another indecisive action with De Grasse off the mouth of the Chesapeake, but was unable to prevent the blockade of that bay, and the consequent surrender of the British army. [CORNWALLIS.] In January 1782 the French invaded the island of St. Christopher. Hood hastened to relieve it; and having induced De Grasse, who lay in the road of Basse-Terre with a considerably superior fleet, to sail out and offer battle, January 25th, he quietly slipped into the vacant anchorage, and maintained his position against repeated efforts to dislodge him; but he was unable to prevent the surrender of the island, which took place on the 13th of February, and on the same night he stood out to sea. It was his desire to preserve his fleet uninjured until Rodney, who was daily expected, should arrive with reinforcements, rather than encounter a premature action with a superior enemy; and so well was the manœuvre executed, that he passed undiscovered within five miles of the enemy. His conduct in the whole of this affair has been warmly applauded by naval critics. For the following transactions see **RODNEY**. The brunt of the action of the 9th of April fell on the van division, which Hood commanded: his own ship, the Barfleur, had at one time seven, and generally three, antagonists. On the great day of the 12th his conduct was equally distinguished. For these services

he was created an Irish peer by the title of Baron Hood of Catherington. After this battle Rodney returned finally to England, leaving Lord Hood again in the chief command, which he retained till the peace of 1783.

In the memorable Westminster election of 1784 Lord Hood opposed Fox, and was returned at the head of the poll. He lost his seat on being made a lord of the admiralty in 1788, but was re-elected in 1790. In 1793 he was appointed to command the Mediterranean fleet. An arduous responsibility, both civil and military, devolved on him, in consequence of the surrender of Toulon to the British fleet by the French royalists. After a long siege the town was pronounced untenable [BONAPARTE], and evacuated December 18th. On this occasion a severe injury was done to the French navy by burning the arsenal, dockyard, and fifteen ships of war; in addition to which eight were carried away. Early in 1794 Lord Hood applied himself to the expulsion of the French from Corsica, which was accomplished chiefly by the astonishing exertions of the British sailors on shore. These were most signally displayed in the capture of Bastia [NELSON], for which Lord Hood received the thanks of both houses of parliament. His health being much impaired, he returned to England at the close of the year, and was not again employed in active service.

In 1796 he was appointed governor of Greenwich Hospital, and raised to the English peerage by the title of Viscount Hood of Whitley. He afterwards received the Grand Cross of the Bath. He died at Bath, in his ninety-second year, June 27, 1816. His professional character has been thus given:—"To great bravery he united great seamanship; he possessed at the same time a certain promptitude of decision, coupled with extraordinary coolness, skill, and judgment. These qualities justly entitled him to the confidence of the public, which he uniformly possessed; while all under his authority yielded a ready obedience to a commander who, when necessary, always appeared foremost in danger, but never risked either ships or men except for the attainment of some great object."

HOOD, ALEXANDER, VISCOUNT BRIDPORT, younger brother of the above, was also brought up to the navy, and also found many opportunities of signalising his skill, activity, and bravery in the lower ranks of his profession. He was made rear-admiral in 1780, and in 1782 sailed as second in command of the fleet sent under Lord Howe to relieve Gibraltar. [HOWE.] He held the same rank in the Channel fleet under the same commander in 1794; and bore a distinguished part in the great victory of the 1st of June. In 1795 he engaged a French fleet off L'Orient, and took three ships of the line; and in the following year, on Lord Howe's resignation, he was appointed to the command of the Channel fleet, which he held till April 1800. He was successively raised to the Irish and English peerage by the titles of Baron and Viscount Bridport, the last creation June 10, 1801. Lord Bridport died at Bath on the 3rd of May 1814. The title is now extinct.

HOOD, SIR SAMUEL, VICE-ADMIRAL, who also was elected M.P. for Westminster in 1806, is not to be confounded with Lord Hood, his namesake and cousin. He was in Rodney's battle of the 12th of April, served in the Mediterranean under Lord Hood in the Juno frigate, and distinguished himself at Toulon and in the reduction of Corsica. Being promoted to the Zealous, 74, he was engaged in the battle of the Nile, and otherwise was honourably employed till the peace of 1802. In 1803, being sent to command on the Leeward Island station, he captured Tobago and the Dutch settlements in Guiana. For these services he received the order of the Bath. He lost his arm off Rochefort in 1806, in an action in which he captured three French frigates; but was again engaged in the expedition against Copenhagen in 1807. He was afterwards appointed to the chief command in India, where he died in 1814, much honoured, regretted, and beloved. He was an admirable officer, cool and prudent, as well as fearless, possessed of great professional skill, ready resources, and a more than common share of scientific knowledge.

CAPTAIN ALEXANDER HOOD, brother of Sir Samuel, another brave and meritorious officer, was killed in command of the Mars, in action with the French 74 L'Hercule, which was captured April 21, 1798.

HOOD, THOMAS, was born in 1798 in the Poultry, London, where his father was a bookseller, of the firm of Vernor and Hood. Thomas Hood was sent to a school in Tokenhouse-yard, in the city, as a day-boarder. The two maiden sisters who kept the school, and with whom Hood took his dinner, had the odd name of Hogsflesh, and they had a sensitive brother, who was always addressed as 'Mr. H.,' and who subsequently became the prototype of Charles Lamb's unsuccessful farce called 'Mr. H.' Hood was afterwards sent to a preparatory school, and in due course was transferred to a finishing school in the neighbourhood of London, but derived little benefit from either.

In 1811 Hood's father died, and soon afterwards his elder brother died also. Thomas Hood being then the only remaining son of the widow, she was anxious to have him near her, and recalled him home. In 1812 she sent him to a day-school; and here as he says in his 'Literary Reminiscences,' "In a few months my education progressed infinitely farther than it had done in as many years under the listless superintendence of B.A. and LL.D. and assistants. I picked up some Latin, was a tolerable grammarian, and so good a French scholar that I earned a few guineas—my first literary fee—by revising a new edition

of 'Paul et Virginie' for the press. Moreover, as an accountant, I could work a *summum bonum*, that is, a good sum."

From this school he was removed to the counting-house of Messrs. Bell and Co., Russia merchants, Warnford-court, City, but his health soon began to fail, and he was sent in a Scotch smack to Dundee. He was then fifteen years of age, and seems to have been left entirely at his own disposal. Fortunately he was not idle, and had no taste for dissipation, but took great delight in reading, as well as in rambling, fishing, and boating. His health gradually improved, and, after remaining two years at Dundee, he returned to London. He engaged himself to Mr. Robert Sands, an engraver, who was his uncle, in order to learn his art, and was afterwards with Le Keux for the same purpose.

In 1821 Mr. John Scott, then editor of the 'London Magazine,' was killed in a duel; the Magazine passed to other proprietors, who happened to be Hood's friends, and he was offered the situation of sub-editor. He had published some trifles in the 'Dundee Advertiser' and 'Dundee Magazine,' while he remained at that place, which were favourably received, but he had not been stimulated to any further appearance in print. "My vanity," says he, "did not rashly plunge me into authorship, but no sooner was there a legitimate opening than I jumped up at it, à la Grimaldi, head foremost, and was speedily behind the scenes."

Hood, while in this situation, became acquainted with several persons who subsequently distinguished themselves in English literature, and who were then contributors to the 'London Magazine,' with Lamb, Carey, Procter, Cunningham, Bowring, Barton, Hazlitt, Elton, Hartley Coleridge, Talfourd, Soane, Horace Smith, Reynolds, Poole, Clare, Benyon, and others. With Lamb especially Hood afterwards became on terms of great intimacy, which continued till Lamb's death.

Hood's first publication in a separate form was 'Odes and Addresses to Great People,' in which he was assisted by his brother-in-law, J. H. Reynolds, and which was brought out anonymously. 'Whims and Oddities,' published in 1826, in small 8vo, consisted chiefly of his contributions to the 'London Magazine,' with some additions. His next work was in prose, 'National Tales,' small 8vo, which was followed by 'The Plea of the Midsummer Fairies, Hero and Leander, Lycus the Centaur, and other Poems,' small 8vo, 1827, a volume of serious poetry which obtained praise from the critics, but little favour from the public. His experience of the unpleasant truth that

"Those who live to please must please to live,"

induced him to have recourse again to his lively vein. He published a second series of his 'Whims and Oddities,' and a third series in 1828. He commenced the 'Comic Annual' in 1829, and it was continued nine years. In the same year his comic poem of 'The Epping Hunt' came out, and excited much mirth at the expense of the Cockney sportsmen. He was for one year editor of 'The Gem,' and wrote for it his poem called 'Eugene Aram's Dream.'

In the spring of 1831 Hood became the occupier of a house called Lake House, belonging to the proprietor of Wanstead in Essex, near which it was situated. While residing here he wrote his novel of 'Tynley Hall.' Pecuniary difficulties compelled him to leave his pleasant residence, in 1835.

The 'Comic Annual' having terminated in 1837, Hood commenced the publication of 'Hood's Own,' in a series of monthly numbers, in 8vo, 1838. It consisted chiefly of selections from the prose and poetry which he had published in the series of the 'Comic Annual,' with several additions. A portrait of himself, for which he sat at the request of the publisher, is attached to the work, and is, as he says himself, a faithful likeness.

Hood went to the Continent for the benefit of his health, but while in Holland the unwholesome air of the marshes produced an accession of illness, which proved of so dangerous a nature that he was compelled to remain abroad much longer than he intended. He went up the Rhine, and was altogether three years in Germany and three years in Belgium. He was in Belgium when he published his 'Up the Rhine,' in the preface of which, dated December 1, 1839, he states that he constructed it on the groundwork of 'Humphrey-Clinker.' The work consists of a series of imaginary letters from a hypochondriacal old bachelor, his widowed sister, his nephew, and a servant-maid, who form the imaginary travelling party. Each individual writes to a friend in England, and describes the scenes, manners, and circumstances, in a manner suitable to the assumed character. The nephew's remarks seem to embody the opinions and observations of Hood himself. The book is illustrated with whimsical cuts in Hood's usual rough but effective style, and abounds in good sense as well as humour.

Hood afterwards became editor of the 'New Monthly Magazine,' after his retirement from which, in 1843, he collected his contributions to that work, and, with additions of prose and poetry, published them under the title of 'Whimsicalities.' He still continued to suffer from ill health; and when the secretary of the Manchester Athenæum requested permission to place his name in the list of patrons to a bazaar, he replied in a letter of kindly feeling as well as humour, dated "From my Bed, 17, Elm-Tree-road, St. John's Wood, July 18, 1843." In 1844 Hood started his last periodical, 'Hood's Magazine,'

and continued to supply the best of its contributions till within about a month before his death. Those who have read the work, and have a taste for wit, humour, and character, will not readily forget his 'Schoolmistress Abroad,' 'Mrs. Gardener,' and his novel of 'Our Family,' which was interrupted by his last illness and death: the last chapters were in fact written by him when he was propped up by pillows in bed. He had the consolation, a short time before his death, of having a government pension of 100*l.* a-year, which was offered to him by Sir Robert Peel, transferred at his own request to his wife. After a lethargy, which continued four days, he died, May 3, 1845. He was buried on the 10th of May in Kensal Green Cemetery. Hood left two children, a girl and a boy, for whom, with his widow, soon after his death a subscription was set on foot, which realised a handsome sum.

Hood was undoubtedly a man of genius. His mind was stored with a vast collection of materials drawn from a great variety of sources, but especially his own observations; and he possessed the power of working up those materials into combinations of wit and humour and pathos of the most original and varied kinds. His vigilance of observation must have been extraordinary. The appearances of nature, the forms and usages of society, great diversity of characters, all arts, professions, and trades lie ready in his mind to supply the demands of his rapid, subtle, and versatile imagination. He has wit of the highest quality, as original and as abundant as Butler's or Cowley's, drawn from as extensive an observation of nature and life, if not from so wide a reach of learning, and combined with a richness of humour of which Butler had little and Cowley none. His humour is frequently as extravagantly broad as that of Rabelais, but he has sometimes the delicate touches of Addison. As a punster he stands alone. His puns do not consist merely of double meanings of words, a low kind of punning of which minds of a low order are capable, and with which his imitators have deluged English comedy and comic literature, but of double meanings of words combined with double meanings of sense in such a manner as to produce the most extraordinary effects of surprise and admiration. His power of exciting laughter is wonderful, his drollery indescribable, inimitable. His pathetic power is not equal to his comic, but it is very great. In some of his 'National Tales,' as well as in his singular poem of 'Eugene Aram's Dream,' he produces an effect upon the feelings which is sometimes little less than sublime. 'His Song of the Shirt,' which he wrote a short time before his death, was a burst of poetry and indignant passion by which he produced tears almost as irrepressibly as in other cases he produces laughter. In his 'Plea of the Midsummer Fairies, Hero and Leander, Lycus the Centaur, and other Poems,' he supports a poetic character quite different from those in which he usually appeared. Without a trace of anything that can be called wit or humour or punning, he displays a gracefulness and delicacy of fancy, a tenderness and sweetness of feeling, a choice of diction, and beauty of versification, which render these serious poems exceedingly delightful; but the poetry is not poetry for the many, though, from its elaborate structure, it may be inferred that it cost him much labour, if not much time. As a novelist Hood has considerable faults. His pages overflow with the exuberance of his imagination to such a degree as to interrupt the course of the narrative, and, by diverting the reader's attention, to weaken his interest in the story. Some of the characters too are injured by what may be called the intrusiveness of his wit, by which both the thoughts and language are often rendered less appropriate to the characters than they would have been without it.

The rude but graphic and humorous sketches by which many of his comic works are illustrated, are for the most part very slightly connected with the pieces to which they are annexed, and seem to be introduced merely for the sake of the whim, as some pun or odd fancy occurred to him.

HOOPT, PETER CORNELIUS, one of the most eminent poets and prose writers of Holland, was born on the 16th of March 1581, at Amsterdam, where his father was an eminent burgher-master. After studying at the high-school at Leyden he travelled to Italy, the study of whose literature and poetry chiefly occupied him during his stay there. On his return in 1602, after an absence of three years, he published his tragedy of 'Granida,' which for harmony and elegance of diction is still considered one of the choicest specimens of the Dutch language. Thus he may be said to have polished his native idiom all at once, and to have refined it, from the harshness and stiffness in which he found it, into such melodiousness and flexibility that he left others more to imitate than to improve upon. He composed several other tragedies, and may be considered in some degree as the founder of the Dutch stage. These pieces, like those of his great contemporary Vondel, are all on the Greek model, and interspersed with choruses. But it is in his lesser productions, his 'Minnedigte,' or amatory compositions, that Hooft displays most originality. Many of these are replete with Anacreontic playfulness, naïveté, and elegance. Hooft attained equal celebrity as a prose writer; for he succeeded in the difficult task of establishing a correct and harmonious style of prose, of which his 'History of the Netherlands' is esteemed a model, remarkable both for its purity and its vigour. Hooft was twice married: his first wife died in 1624, his second survived him. In her society and that of his numerous friends the last twenty years of his

life were passed in lettered ease and enjoyment. His château at Muiden was the rendezvous of all who were distinguished for talents. He died May 21st, 1647.

HOOGHE, PETER DE, was born about 1643, but the place of his birth is uncertain, as well as the master under whom he studied, though some say it was Berghem. At all events it is evident from his works that he had studied in some good school. "His pictures," says Dr. Waagen, "are a striking proof that an artist has but to produce something excellent, even in a lower department of the art, in order to make his works highly attractive. For the actions in which his persons are engaged are in general very indifferent, the faces monotonous and vacant, and the execution often careless; but then he understands how to represent the effects of the light of the sun in the most marvellous force and clearness, and to avail himself, with the finest tact, of all the advantages of his art by soft gradations and striking contrasts." His pictures, of which there are some capital specimens in England, sell at high prices. There is no work by him in either the National or the Dulwich Gallery.

HOOGVEEN, HENRY, was born at Leyden in January 1712. His parents, who were in humble circumstances, sent him to the gymnasium in his native town, where, like many other persons who have distinguished themselves in after-life, he did not at first make much progress in his studies. But as he advanced to maturity his merit became apparent, and he was appointed at the age of twenty co-director of the school of Gorinchem, and in the following year (1733) was placed at the head of the gymnasium at Woerden. He filled successively the office of rector at the gymnasia of Kulenburg, Breda, Dort, and Delft, at the last of which places he died in 1791.

The principal work of Hoogveen is a treatise on the Greek Particles (3 vols. 4to, Leyd., 1769), of which an abridgment was made by Schütz (Leip., 1806). He also published an edition of Viger on the Greek Particles, with numerous notes; but neither this work nor his treatise on the Greek Particles give us a high opinion of his scholarship. A useful work of Hoogveen, entitled 'Dictionarium Analogicum Lingue Græcæ,' was published after his death at Cambridge, in 1800. This dictionary is merely a list of the words in the Greek language, arranged in alphabetical order, according to their final letters. All words with the same termination of course come together, and thus a comparison can be instituted between them, which often leads to valuable etymological results.

*HOOK, JAMES CLARKE, A.R.A. From choice of subjects or manner of treatment, it often happens that painters, highly esteemed by their brother-artists, and well known to the admirers and students of art, are slow to catch the popular eye: so it has been with Mr. Hook. While his pictures year after year have shown great and steadily-increasing artistic knowledge, and a highly cultivated mind, and though they have secured high professional recognition, they have failed to win for the painter hitherto much notice beyond art circles. His earlier pictures, besides portraits, were chiefly of Italian subjects; admirably painted, and showing a range of reading beyond that usual among English artists, as well as much observation, but having little general interest. Of these, among the more important were—'Pamphilus relating his Story,' exhibited in the Royal Academy in 1844; 'Otho IV. of Florence and the Maid Gaudrada,' 1848; 'Bianca Capello,' 1849; 'A Dream of Venice,' and 'Escape of Francesco de Carrara,' 1850; 'Rescue of the Brides of Venice,' 1851; and the 'Return of Torello,' 1852. In these pictures the influence of the painter's admiration of Sir Charles Eastlake, on whose style that of Hook was evidently formed, was especially manifest; but it was scarcely less evident in his Shaksperian and historical works, such as 'Othello's First Suspicion,' 1849; 'The Defeat of Shylock,' 1851; 'Othello's Description of Desdemona,' 1852; and 'The Chevalier Bayard wounded at Brescia,' 1849, one of Hook's best historical works, and that which secured him his election into the Royal Academy. Some of his later works of this order, as 'The Time of the Persecution of the Christian Reformers in Paris' (1854), have shown a more self-reliant style; while his latest scriptural piece, 'Gratitude of the Mother of Moses for the Safety of her Child' (1855), is a thoroughly admirable work, oriental in character, original as well as chaste in style, and reverential in feeling. In 1854 Mr. Hook struck into a new path. He had been studying English country life and scenery, and, as the result, he sent to the Academy exhibition some pictures in which figures of a moderate size were very happily introduced in combination with pastoral and sea-side landscapes, so that each helped the other (as in Collins's better works) to tell the story. This vein he has pursued; and, judging from the specimens which he sent to the exhibition of 1856, there can be little doubt that it will be in every sense a profitable one. Among his productions in this line may be named, 'The Market Morning,' and 'The Shepherd Boy,' 1855; 'The Brambles in the Way,' 'A Passing Cloud,' 'Welcome Bony Lass,' and 'The Fisherman's Good Night,' 1856. Though of a homely class, they exhibit all the careful painting, harmonious colouring, and refined taste of his more pretentious works, and they are thoroughly English in character. Mr. Hook was elected an Associate of the Royal Academy in 1850.

HOOK, THEODORE EDWARD, was born on the 22nd of September 1738, in Charlotte-street, Bedford-square, London. He was the

son of James Hook, a musical composer of some celebrity in his day, by his first wife (Miss Madden), a beautiful, accomplished, and excellent woman. There was only one other child by that marriage, Dr. James Hook, dean of Worcester, who was born in 1773, and died on the 5th of February 1828. Dr. Hook married a daughter of Sir James Farquhar, physician, in 1797; and wrote two musical pieces, 'Jack of Newbury' (1795) and 'Diamond cut Diamond' (1797), which were never printed; and two clever novels, 'Pen Owen' and 'Percy Mallory,' which have been republished. Theodore Hook's mother died in 1802, while he was yet a school-boy at Harrow. His father did not send him again to school after the funeral; and not long afterwards he married again.

Theodore Hook was a handsome boy, and remarkably clever; he had a fine ear, was an expert performer on the pianoforte, had a sweet and powerful voice, and sang a pathetic song well and a comic song delightfully. His father was employed at Vauxhall and the theatre, and Theodore wrote songs for him, and sometimes composed the airs. The stripling soon received a free admission before the curtain and behind it, and had his share of his father's profits. His brother, who had taken his degrees at St. Mary's Hall, Oxford, and was then advancing in the Church, seeing the danger to which the young man's character was exposed in this career of dissipation, persuaded his father to send him to the university, and the future dean went with him to be entered at Oxford. But in order to go through a prescribed course of reading, he was not to commence his residence at the university till after the expiration of a couple of terms, and he returned with his brother to London. He immediately set about writing an operatic farce, 'The Soldier's Return' (1805), which was very successful, and he gave up all thoughts of the university. He afterwards wrote several other successful operatic pieces and farces:—'Catch him who can,' 1806; 'The Invisible Girl,' 1806; 'Tekeli,' 1806; 'The Fortress,' 1807; 'Music Mad,' 1808; 'Siege of St. Quentin,' 1808; 'Killing no Murder,' 1809; 'Safe and Sound,' 1809; 'Ass-assination,' 1810; 'The Will, or the Widow,' 1810; 'Trial by Jury,' 1811; 'Darkness Visible,' 1811. In 1809 (he was then only twenty) he made his first essay as a novelist by the publication of 'The Man of Sorrow,' under the assumed name of Alfred Allandale, Esq. It was a very flimsy work, and had no success. His life at this time was a series of riotous buffooneries. In 1809 he played off one of the most audacious and reckless hoaxes on record, which is known as the 'Berners-street Hoax.' Not only Berners-street, but all the streets connected with it, were rendered almost impassable by vehicles of all descriptions laden with goods of all kinds, from the heaviest to the lightest; and persons of all ranks and professions, including the commander-in-chief, the Archbishop of Canterbury, and the lord mayor, received invitations, and most of them attended.

Hook was even at this period distinguished for his conversational powers, but his talent as an 'improvisatore' is described as marvellous. He was the companion of the first Charles Matthews; and Mrs. Matthews, in her 'Memoirs' of her husband, relates numerous instances, not only of Hook's displays of improvisation, but of the feats of mimicry which they played off separately and conjointly. Hook was invited to perform before the Prince Regent, who was so much delighted, that after some similar exhibitions at Lady Hertford's and elsewhere, the Regent declared that "something must be done for Hook;" and late in 1812 something was done for him:—he was appointed Accountant-General and Treasurer to the Colony of the Mauritius, with a salary and allowances amounting to nearly 2000*l.* a-year. He reached his destination on the 9th of October 1813, being then only twenty-five years of age. The climate, the society, the amusements, everything delighted him, and he indulged in the most lavish expenditure. Towards the close of 1817, General Farquhar, the governor, sailed for England, and Major-General Hall was sworn in as deputy-governor during his absence. An examination of the accounts and state of the treasury took place, and the report of the examiners declared that everything was correct. Soon afterwards however a man of the name of Allan, who was in the treasury department, made a declaration that he knew and had long known that there was a deficiency of 37,000 dollars. Further examinations took place, more deficiencies were discovered, and the result was that Hook was arrested on the 9th of March 1818; all his property was seized, and he was sent back to England in custody. The ship reached Portsmouth in January 1819, and the documents were submitted to the law-officers of the crown. The attorney-general's report was, that though Hook might be liable to a civil prosecution for debt, there was no apparent ground for a criminal prosecution, and he was set at liberty with only two gold mohurs in his pocket. He took a small cottage in Somers Town, and formed connections with newspapers and magazines, by which he was enabled to supply himself with the present means of subsistence. He lived in obscurity, and was known only to a few of his old associates, such as Matthews, Terry, Tom Hill.

In 1820 Sir Walter Scott was in London, and, dining one day with his old friend Terry, met there Matthews, and, for the first time, Hook. The inquiry into Hook's defalcation was still before the audit-board, and the proceedings were represented to Scott as a cruel prosecution; he was much pleased with Hook's conversational powers; they were both staunch Tories; and Scott having soon afterwards been applied to by a nobleman of influence to recommend an editor for a provincial news-

paper, he named Hook. Hook however was not destined for provincial celebrity. The 'John Bull' newspaper was established, with Hook for its editor. The career of the 'John Bull' is well known; its attacks upon Queen Caroline and her supporters, its virulence, its personalities, and the talent which raised its circulation to so great a height. Hook, in its prosperous state, received full 2000*l.* a year from it; and though its circulation gradually diminished, he derived a considerable profit from it up to the time of his death. Meantime the Whigs took care that the inquiry before the audit-board should not be dropped; and the result was, that at first the balance found against him was 20,000*l.*, which on further investigation was reduced to 15,000*l.*, and at last the extent was issued for 12,000*l.* Hook admitted at an early date that the deficiency was 9000*l.*, but afterwards asserted that a strict scrutiny would have struck off 3000*l.* from that sum. There is no proof of actual peculation on the part of Hook; but there is proof that he himself and his officers kept the treasury books with the most culpable and scandalous carelessness, and that the keys of the treasure-chest were frequently left with underlings while he was absent on pleasure excursions. In August 1823 he was arrested under a writ of Exchequer, his property was sold, and realised about forty pounds, and he was taken to a spunging-house in Shire-lane, Fleet-street, where he remained till April 1824, whence he was transferred to the Rules of the King's Bench, and he remained there till May 1825, when he was released from custody, but with an intimation that the crown abandoned nothing of its claim for the debt. He then took a cottage at Putney.

Hook published his first series of 'Sayings and Doings' in February 1824, while confined in the spunging-house, and his diary records the profit to have been 2000*l.*, and he realised sums almost as large by the novels and other works which he published in rapid succession afterwards. The following is a list of the whole of them:—'Sayings and Doings,' First Series, 3 vols., 1824; Second Series, 3 vols., 1825; Third Series, 3 vols., 1828; 'Maxwell,' 3 vols., 1830; 'Life of Sir David Baird,' 2 vols. 8vo., 1832; 'Parson's Daughter,' 3 vols., 1833; 'Love and Pride,' 3 vols., 1833; 'Gilbert Gurney,' 3 vols., 1835; 'Jack Brag,' 3 vols., 1837; 'Births, Deaths, and Marriages,' 3 vols., 1839; 'Gurney Married,' 3 vols., 1839; 'Precepts and Practices,' 3 vols., 1840; 'Fathers and Sons,' 3 vols., 1840; 'Peregrine Bunce,' 3 vols., 1841; some months after his death. In 1836 he became editor of the 'New Monthly Magazine,' and 'Gilbert Gurney,' 'Gurney Married,' 'Precepts and Practices,' and 'Fathers and Sons,' were originally published in periodical portions in that work. He also wrote 'Kelly's Reminiscences,' from Kelly's notes, in 1836, without remuneration, and merely out of kindness to his old friend.

While residing at Putney he gradually mixed more and more freely in society; and in 1827 took a house in Cleveland Row, St. James's, which has since been the residence of a wealthy nobleman; he became a member of divers first-rate clubs, received invitations from persons of the highest distinction, in town and country, and ran himself rapidly and deeply into debt, notwithstanding the large sums which he obtained by his literary labours. By his ambitious and criminal extravagance, which he supplied at a ruinous expense of labour of mind and body, his constitution, excellent as it was originally, was completely broken up. In July 1841, when dining at Brompton, he was observed to be unwell, and as he stood with the coffee in his hand, turned suddenly to the mirror, and said, "Ay, I see I look as I am; done up in puree, in mind, and in body too at last."

From that time he was confined to his house. About the middle of August he requested the Rev. Mr. Gleig, chaplain of Chelsea Hospital, who was an old acquaintance, but had never been at his house, to pay him a visit. He did so, and being known to the servant as a clergyman, was admitted without announcement. Hook was somewhat confused at being caught in dishabille, but after a moment's pause observed, "Well, you see me as I am at last—all the bucklings and paddings, and washings, and brushings, dropt for ever—a poor old grey-headed man, with my belly about my knees." He had latterly been much made-up. He died August 24, 1841, in the fifty-third year of his age. His novel of 'Gilbert Gurney' contains a sort of autobiography of himself.

While living at Somers Town he had become acquainted with a young woman, and by her he had six children: she was respectable, and he always behaved well to her, but he had not the moral courage to marry her, though, according to his diary, he had sometimes thoughts of doing so. A few hundred pounds were subscribed for her and the children after Hook's death. He was a good-natured man, and willing to do acts of kindness, but he had no moral principle sufficiently strong to restrain the impulses of the moment.

Hook's conversational power was greater than his power as a writer. He was an admirable narrator, abounded in smart sayings, which, if not of the highest quality of wit and humour, were so said as to appear the best things ever uttered, and he could intermix serious remarks full of good sense and derived from a wide observation of life. His novels are not of a high order; they contain indeed excellent descriptions of the various forms of life with which he had been conversant, rapid but striking sketches of character, and laughable extravagances, conveyed in a clear, fluent, and often picturesque style. He was well calculated for a popular writer, but is not likely to continue popular long. His novels will shortly share the fate of

his dramatic pieces, and be forgotten. His satirical poems are little better than doggerel, and the points, now that the circumstances which gave rise to them have passed away, seem very blunt indeed: his power in these poems was generally in the coarseness of his invectives, not in satirical wit, of which indeed he had little, and that of inferior quality.

(*Quarterly Review*, May 1842, an entertaining and instructive article, written in a fair spirit, by one who knew Hook well, reprinted in Murray's *Railway Reading*; and *Life and Remains of Theodor Hook*, by the Rev. R. H. Barham.)

* HOOK, REV. WALTER FARQUHAR, D.D., is the son of the Rev. James Hook, Dean of Worcester. He was educated at Winchester College, and at Christchurch, Oxford, where he graduated in 1821. After being for some time curate at Whippingham, Isle of Wight, he was appointed in 1827 lecturer at St. Philip's Church, Birmingham. In 1829 he became vicar of Trinity Church, Coventry. In 1837 he was chosen vicar of Leeds, which office he still retains, and is also rural dean, prebendary of Lincoln, and chaplain in ordinary to the queen. Dr. Hook has greatly distinguished himself in the parish of Leeds by his activity and usefulness, as well in the performance of his clerical duties as by his successful efforts to extend education among the poorer classes. He was also one of the promoters of the Act of Parliament for the division of populous parishes, and is a member of the commission for that purpose. His own parish was divided under the Act, and his own income thereby greatly reduced. The parish church of St. Peter, Leeds, was rebuilt at an expense of 30,000*l.*, and was consecrated Sept. 2, 1841, by the Bishop of Ripon. In 1851, on the tenth anniversary of the consecration, he preached a sermon, in which he stated that thirteen new churches had been erected in the parish in as many years, that others were building, and that school-rooms had been provided for 10,000 children. In 1856 Dr. Longley, bishop of Ripon, on taking leave of the clergy of his diocese, stated that twenty churches had then been built in Leeds through the exertions of Dr. Hook.

Dr. Hook is the author of several works, of which the following are the most important:—'An Ecclesiastical Biography, containing the Lives of Ancient Fathers and Modern Divines, interspersed with Notices of Heretics and Schismatics, forming a Brief History of the Church in every Age,' 8 vols. 12mo, London, 1845-52; 'A Church Dictionary,' 8vo, 7th ed., 1854. This work originally appeared in monthly tracts, intended to explain to the author's parishioners the more important doctrines of the church and the fundamental truths of the Christian religion. As the circulation was large, he was induced to alter and extend his plan so as to render it a work of more general utility than was at first designed. 'Sermons suggested by the Miracles of our Lord and Saviour Jesus Christ,' 2 vols. 12mo, 1847; 'On the Means of rendering more effectual the Education of the People,' 8vo, 10th ed., 1851; 'The Three Reformations,' 8vo, 3rd ed., 1854; 'Discourses bearing on the Controversies of the Day,' 8vo, London, 1853; 'Family Prayers,' 18mo; 'Private Prayers,' 18mo; 'Church of England Vindicated' (sermons), 12mo; 'Sermons at Oxford,' 12mo; 'Last Days of our Lord's Ministry,' 12mo. Dr. Hook is also the author of several sermons which have been published separately, and has edited some useful devotional works written by others.

HOOK, NATHANIEL, died in 1764. We are ignorant of the place and time of his birth. He was a Roman Catholic, enjoyed the friendship of Pope, and was intimate with most of his eminent literary contemporaries. He is said to have lost his fortune in the South Sea scheme. The work by which Hook is principally known is entitled 'The Roman History, from the Building of Rome to the Ruin of the Commonwealth,' which was originally published in 4 vols. 4to, 1733—1771, and though now of little value has been frequently reprinted. This work is little else than a translation of the classical writers on Roman history; and in those parts which relate to the contests between the Patricians and Plebeians the author defends the cause of the latter with as much partiality as Middleton, in his 'Life of Cicero,' had supported the side of the former. Hooke also published a work on the Roman Senate in answer to Dr. Middleton's and Dr. Chapman's treatises on the same subject, 1758; and translated from the French the 'Life of Fenelon,' 1723, and Ramsay's 'Travels of Cyrus,' 1739.

HOOK, ROBERT, was born July 18, 1635, at Freshwater, in the Isle of Wight, of which parish his father was then minister. After leaving Westminster School, where he had been placed under the care of Dr. Busby, he entered Christchurch, Oxford, in the year 1653; and shortly afterwards, having been introduced to the Philosophical Society of Oxford, we learn that he was engaged to assist Dr. Wallis in his chemical experiments, and that he subsequently served Mr. Robert Boyle in a similar capacity. In 1662 he was appointed curator of experiments to the Royal Society; and when that body was incorporated by charter the following year, Mr. Hooke was one of those Fellows who were first nominated by the council. (Thomson's 'Hist. of the Royal Society,' appendix iv.) In 1664 he succeeded Dr. Dacres as professor of geometry in Gresham College; and two years after, having produced a plan for rebuilding the city of London, which had been recently destroyed by fire, he received the appointment of city surveyor, and from the emoluments of that office he subsequently acquired considerable wealth. (Ward's 'Lives of the Gresham Professors,' London, 1740, fol.) In 1668, Hevelius

having sent a copy of his 'Cometographia' to Mr. Hooke, the latter, in return, sent Hevelius a description of his new dioptric telescope, which led to a dispute wherein several of the members of the Royal Society afterwards became involved. [HEVELIUS.] In 1677 he succeeded Oldenburg as secretary to the Society. In 1691 he was created Doctor of Physic, by a warrant from Archbishop Tillotson. He died at Gresham College in 1702, in his sixty-eighth year, exhausted by long-continued and meritorious exertions in the cause of science. His funeral was attended by all the members of the Royal Society, and his remains were interred in the church of St. Helen, Bishopgate Street. In his person Hooke was short of stature, thin, and crooked. He seldom retired to bed till two or three o'clock in the morning, and frequently pursued his studies during the whole night. His inventive faculty was surprisingly great, but he was chiefly characterised by his mechanical turn and his great sagacity in discovering the general laws of phenomena, in proof of which it will be sufficient to give the following extract from a paper communicated by Dr. Hooke in 1674 ('Phil. Trans.,' No. 101, p. 12), entitled 'An Attempt to prove the Motion of the Earth from Observation,' wherein he says "he will explain a system of the world differing from any yet known, but answering in all things to the common rules of mechanical motions, which system depends upon three suppositions. 1. That all celestial bodies whatsoever have an attraction or gravitating power towards their own centres, whereby they attract not only their own parts and keep them from flying from them (as we may observe the earth to do), but also all other celestial bodies that are within the sphere of their activity. 2. That all bodies whatsoever that are put into a direct and simple motion will so continue to move forward in a straight line till they are by some more effectual power deflected and bent into a motion that describes some curved line. 3. That these attractive powers are so much the more powerful in operating, by how much nearer the body wrought upon is to their own centres." "This," observes Mr. Barlow ('Encyc. Metro.' art. 'Astronomy'), "was a very precise enunciation of a proper philosophical theory." The works left by Dr. Hooke are too numerous to mention here; but the reader will find a complete list of those published during his lifetime, and also of his posthumous works, in Ward's 'Lives of the Gresham Professors.'

HOOKER, otherwise VOWELL, JOHN, an English historian, born at Exeter about 1524. His father, Robert Hooker, was mayor of that city in 1529. John Hooker was bred at Oxford, but whether in Exeter or Corpus Christi College, Wood was uncertain. He afterwards travelled in Germany, and studied law at Cologne. Soon after his return to England in 1554, he was made chamberlain of his native city, being the first person who held that office. He was subsequently sent into Ireland upon the affairs of Sir Peter Carew, and was elected Burgess for Atheryn in the parliament of 1568. In 1571 he represented Exeter in the parliament of England. His printed works were:—1. 'The Order and Usage of Keeping of the Parliaments in England,' 4to, London, 1572; written for the purpose of regulating and conducting the proceedings of the parliament of Ireland. 2. 'The Events of Comets or Blazing Stars made upon the Sight of the Comet Pagania, which appeared in November and December, 1577,' 4to, London, 1577. 3. 'The Description of the Cittie of Excester,' 4to. 4. 'A Pamphlet of the Offices and Duties of everie particular sworn Officer of the Cittie of Excester,' 4to, London, 1584. 5. 'A Catalogue of the Bishops of Excester,' 4to, London, 1584. The three last articles were reprinted together at Exeter, 4to, 1765. Hooker was also the principal editor of Holinshed's 'Chronicles' in 1586, which he greatly augmented and continued, more particularly in what related to Ireland. He also added to Holinshed a translation of Giraldus Cambrensis. He died in 1601, and was buried in the cathedral of Exeter. (Wood, *Ath. Ox.*, last edition, vol. i., p. 718; Herbert, *Typogr. Antiq.*; Prince, *Worthies of Devon*; Tanner, *Bibl. Brit. Hib.*)

HOOKER, RICHARD, was born at Heavytrees, near Exeter, about 1553, according to Walton, or about Easter, 1554, according to Wood. By the kindness of his uncle, John Hooker, chamberlain of Exeter, he obtained a better education at school than his parents could have afforded; and he was afterwards introduced by the same relative to the notice of Bishop Jewel, who procured him in 1567 a clerkship in Corpus Christi College, Oxford. In December 1573 he became a scholar of that college, and a fellow and master of arts in 1577. In 1579 he was appointed lecturer on Hebrew in the university, and in October of the same year he was expelled his college, with Dr. John Reynolds and three other fellows, but restored the same month. In about two years he took orders, and was appointed to preach at Paul's Cross. On this occasion he lodged with Mr. John Churchman, whose daughter Joan he married in the following year. "This lady," Isaac Walton says, "brought him neither beauty nor portion." His fellowship being vacated by his marriage, he was presented to the living of Drayton-Beauchamp, in Bucks, by John Cherry, Esq., in 1584. Here he received a visit from an old pupil, Edward Sandys, who took pity on his poverty, and obtained from his father, the Archbishop of York, a promise of preferment for him. Through the archbishop's influence he was appointed Master of the Temple in 1585. Here he became engaged in a controversy on church discipline and some points of doctrine with Walter Travers, afternoon lecturer at the Temple, who had been ordained by the Presbytery at Antwerp, and held most of

the opinions of the divines of Geneva. Travers being silenced by Archbishop Whitgift, appealed to the privy-council, but without success. His petition to the council was published, and answered by Hooker. Travers had many adherents in the Temple, and it was their opposition, according to Izaak Walton, which induced Hooker to commence his work on the 'Laws of Ecclesiastical Polity.' Finding that he had not leisure at the Temple to complete that work, he applied to Whitgift for removal to a more quiet station, and was accordingly presented to the living of Boscombe in Wiltshire in 1591. On the 17th of July in the same year he was made a prebendary of Salisbury. At Boscombe he finished four books of the 'Ecclesiastical Polity,' which were published in 1594. On the 7th of July 1595 he was presented by the queen to the living of Bishopsbourne in Kent, which he held till his death, on the 2nd of November 1600. He was interred in the church at Bishopsbourne, where a monument was afterwards erected to his memory by Sir William Cowper.

Hooker's manner was grave even in childhood; the mildness of his temper was proved by his moderation in controversy; and his piety and learning procured him the general esteem of his contemporaries. His great work is his defence of the constitution and discipline of the Church of England, in eight books, under the title of 'The Laws of Ecclesiastical Polity.' This work obtained during the author's lifetime the praise of a pope (Clement VIII.) and a king (James I.), and has ever since been looked upon as one of the chief bulwarks of the Church of England and of ecclesiastical establishments in general. As a work of solid learning, profound reasoning, and breadth and sustained dignity of style, it is indeed beyond praise; but the common objection is a just one, that Hooker's reasoning is too frequently that of an advocate. The publication of the first four books has been mentioned above; the fifth was published in 1597. He completed the last three books, but they were not published till several years after his death. The account which Walton gives of the mutilation of the last three books is very improbable, and little doubt can be entertained of their authenticity, though they are certainly imperfect, and probably not in the condition in which he left them.

Besides the 'Ecclesiastical Polity,' Hooker left some tracts and sermons. The latest and best editions of his works are those printed at the Clarendon Press, Oxford.

*HOOKER, SIR WILLIAM JACKSON, an eminent botanist, was born in the year 1785 at Norwich. He was originally destined for trade, but his love of botany induced him early in life to make a tour in Iceland, for the purpose of studying its natural history. He unfortunately lost the whole of his collection, but in 1809 he published his 'Tour in Iceland,' in which he gave an account of the plants of that island. He subsequently devoted himself entirely to the pursuit of botany, and has published a great variety of valuable works in different departments of this science. In 1812 he published the first part of his 'Monograph on the British Jungermannia,' which was completed in 1816. In this year he also undertook the continuation of Curtis's 'Flora Londinensis,' in which a variety of new plants were described. In 1818, in conjunction with Dr. Taylor, he published the 'Muscologia Britannica,' in which for the first time a complete account was given of the British mosses. In 1821 he published the 'Flora Scotica,' and in 1823 he commenced the 'Exotic Flora,' a work embracing figures and descriptions of new, rare, or otherwise interesting exotic plants, especially such as were desirable for cultivation. In this work a large number of new plants were for the first time described and figured. He also edited a continuation of Curtis's 'Botanical Magazine,' and from 1823 to 1833 published a 'Botanical Miscellany,' in which also figures and descriptions of plants were given, and especially of those which were of use in the arts, medicine, or domestic economy. This work with the same design has been continued in the 'Journal of Botany.' From 1826 to 1837, Sir William Hooker was employed in publishing, in conjunction with Dr. Greville of Edinburgh, the 'Icones Filicum,' consisting of figures and descriptions of Ferns. Assisted by the Rev. M. J. Berkeley, he published a continuation of Smith's 'English Flora,' comprising the *Fungi*. In 1830 he brought out the 'British Flora,' a work containing a complete description of British plants. This work, like Smith's 'English Botany and Flora,' was originally published on the Linnæan or artificial system of classification, but on its reaching the fifth edition, the natural system was adopted. As editor of the 'Journal of Botany,' and one of the editors of the 'Annals and Magazine of Natural History,' Sir William Hooker has described a large number of plants, and he deservedly ranks amongst the most distinguished cultivators of systematic botany of the present century.

For many years Sir W. J. Hooker was Professor of Botany in the University of Glasgow. He was removed from this position to that which he at present occupies as Director of the Royal Gardens of Kew. His management of the Botanic Garden of Glasgow and his extensive knowledge of plants prepared him to do justice to this position. From the time this garden was placed under his direction, a continued series of improvements have taken place, and it now stands unrivalled in the world for the variety and beauty of its collections of living plants. Under his management the large conservatory and other new houses have been erected. The museum of the useful products of the vegetable kingdom was also commenced under his direction, and a new building is now erecting (1856) for this truly

national collection. The facilities of access have also been greatly increased, and these gardens are bidding fair to become a great educational establishment for the diffusion amongst the people of a knowledge of the natural history of the vegetable kingdom. He has also published a very useful popular guide to the treasures which the garden contains.

In 1836 Sir William Jackson Hooker was knighted, and he is one of the few men of science in this country who have received this honour on account of their scientific attainments. He has been for many years one of the vice-presidents of the Linnæan Society, and a Fellow of the Royal Society. He is also an honorary member of many foreign scientific societies. In 1845 he received the honorary degree of D.C.L. from the University of Oxford. In 1855 he was made knight of the Legion of Honour. In 1814 Sir W. J. Hooker married the eldest daughter of Dawson Turner, Esq., F.R.S., of Yarmouth, who is well known for his devotion to natural history pursuits.

*HOOKER, JOSEPH DALTON, M.D., the only surviving son of Sir William Jackson Hooker, is, like his father, distinguished as a botanist. Educated for the medical profession, and holding the degree of Doctor of Medicine, Dr. Hooker has forsaken the practice of his profession for the more fascinating pursuit in which his father has so greatly distinguished himself. Dr. Hooker is already known as a traveller, and his contributions to the science of botany are so extensive and valuable, that the son's reputation is bidding fair to eclipse that of the father. In 1839, on the occasion of the fitting out of the expedition to the Antarctic Ocean, under Sir James Ross, Dr. Hooker was appointed assistant-surgeon on board the Erebus. Although appointed surgeon, his real object was to investigate the botany of the district through which the expedition passed—an object which was generously encouraged by the enlightened commander of the squadron. The result was the publication of the 'Flora Antarctica,' in which Dr. Hooker has not only figured and described a large number of new plants, but by comparison of the species obtained in this voyage with those of other parts of the world, has succeeded in advancing greatly our knowledge of the laws which govern the distribution of plants over the surface of the earth. In 1848 Dr. Hooker started on another expedition. He had investigated the plants of temperate and cold climates, and he could not rest till he had investigated those of tropical countries. His choice lay between the Andes and the Himalaya, and it fortunately fell upon the latter. His route lay through districts not under British superintendance: his adventures were numerous, and his position occasionally even dangerous, having been for some time kept prisoner by the presiding governor of a district in the Sikkim-Himalaya. He returned to England in 1852, and published his 'Himalayan Journals,' in 2 vols., constituting one of the most readable contributions to scientific travelling that has been made during the present century. His 'Himalayan Journals' however give but an imperfect idea of his scientific labours. His large collections of plants, and the first volume of a large work entitled 'Flora Indica,' afford the best evidence of the industry and intelligence displayed during his three years' peregrinations in the Sikkim and Nepal Himalayas. Some of his contributions to scientific botany are better known than his 'Flora Indica;' thus in 1851, long before he returned to this country, the public were surprised at receiving from his pen and pencil descriptions, with beautiful illustrations, of a large number of new species of Rhododendrons from the Sikkim-Himalaya. Many of these species have been since introduced, and are the glory of our annual exhibitions of Rhododendrons and their allied forms. In these travels Dr. Hooker received considerable assistance from the government, but a large proportion of the expense was defrayed from his own private resources.

Previous to his travels in the Himalaya, Dr. Hooker held an appointment in the Museum of Economic Geology, and has contributed a most valuable paper to the second volume of the 'Transactions' of that institution. This paper was on a subject with which he was peculiarly fitted to deal, and was entitled 'On the Vegetation of the Carboniferous Period, as compared with that of the present day.'

On his return from the Himalaya, Dr. Hooker married the eldest daughter of the Rev. W. Henslow, Professor of Botany in the University of Cambridge. He is one of the examiners of the candidates for the East India medical service. He is a Fellow of the Royal Society, and a member of the council of the Linnæan Society.

HOOPER, JOHN, one of the most venerated martyrs of the Reformation, was born in Somersetshire about 1495, and educated at Oxford, where, by study of the Scriptures and the works of the foreign reformers, he was converted to Protestantism. On this account he found it expedient to quit the university, and finally the kingdom, apparently about 1540. For some years he led a wandering life, part of which was spent in Switzerland, the stronghold of the Reformation, where he met with a most friendly reception from the chief divines. On the accession of Edward VI. in 1547, he returned to England, and settled in London, where he was very diligent, and greatly followed and admired as a preacher. In 1550 he was appointed bishop of Gloucester; but his assumption of the office was long delayed by his scrupulousness as to the use of the episcopal dress. By way of overcoming his reluctance he was confined to his own house, and finally committed, during some months, to the Fleet prison. Even the Swiss divines however regretted that his influence in the Church should

be marred by such considerations, and exhorted him to compliance. Finally the matter was compromised. In 1552 he received the bishopric of Worcester in commendam. "While he was bishop," Wood says, "he preached often, visited his dioceses, kept good hospitality for the poorer sort, and was beloved of many. But when Queen Mary began to reign, in July 1553, he was persuianted up to London in the latter end of August, and committed to the Fleet, where, remaining some months, he was at length examined several times, and required to recant his opinions; but standing constant and resolute to them, was condemned to be burnt in January 1556." He suffered accordingly on the 9th of February, at Gloucester, bearing his torments, which were dreadful, with exceeding courage. His works are numerous, chiefly controversial. (Wood, *Ath. Oxon.*; Fox, *Martyrs*; Burnet, *Hist. Ref.*; &c.)

HOPE, THOMAS, a descendant of the wealthy family of the Hopes of Amsterdam, was born about the year 1770. "From an infant," as he himself tells us, "architecture was always my favourite amusement. . . . No sooner did I become master of myself, which unfortunately happened at the early age of eighteen, than disdaining any longer to ride my favourite hobby in the confinement of a closet, I hastened in quest of food for it in all the different countries where any could be expected." He remained abroad several years: his passion for architecture inducing him to explore regions that were then considered almost beyond the track of civilisation—to study the monuments of Egypt on the banks of the Nile; those of Ionia, Northern Greece, the Peloponnesus, and Sicily; those of the Tartar and Persian styles in Turkey and Syria; of the Moorish and Arabian on the coasts of Africa and in Spain; those of the Etruscan, Lombardic styles, &c., in Italy; and finally, those of the Gothic, in France, Germany, Spain, Portugal, and afterwards here at home.

Eight years, he tells us, were thus occupied by him with a persevering application that would have daunted most professional students, more especially as his researches were attended with many fatigues and privations, and frequently with great risks. Soon after his return to England, he began to apply his studies practically by remodelling and enlarging his mansion in Duchess-street, Portland-place, extending the plan of the original house very considerably by galleries carried round three sides of the court-yard. Of these rooms, which are in continuation of the apartments on the principal floor, the largest one (about 100 feet by 24) is on the north side, and the others, consisting respectively of a suit of small cabinets filled with Etruscan or Greek fictile vases, on the east side, and the statue gallery on the west; and in addition to these, Mr. Hope added several years afterwards (1820) the Flemish Gallery, so called from being entirely occupied by productions of that school. He thus rendered his house one of the largest private mansions in the metropolis; and though he did not bestow on it the slightest beauty of exterior, or even any regard at all to appearance, he fitted up and furnished the interior in a style of refined classical taste that was then a decided novelty in this country. His first publication on 'Household Furniture,' in 1805 (a splendid folio volume, with 60 plates finely engraved in outline, and representing together with views of the rooms the furniture and decorations of his own mansion), created an entire change in taste, though it also drew down upon him the undesired ridicule of the 'Edinburgh Review,' which could not resist sneering at the gentleman-upholsterer.

In 1809 appeared his 'Costume of the Ancients,' which had also great influence in promoting a taste for classical design and study; and in the same year he contributed to a periodical (by J. Landseer) entitled 'Review of Publications of Art,' an essay on the 'Architecture of Theatres.' Mr. Hope had been the first to discern and patronise the talent of Thorwaldsen, whom he commissioned to execute his 'Jason' for him in marble; but he was not always so fortunate as to select worthy objects of patronage, for in one instance he bestowed it where it was altogether unmerited. Some dispute arising between him and a French artist named Dubost, the latter painted and made a public exhibition of a libellous picture professing to be the portraits of Mr. and Mrs. Hope, and announced under the title of 'Beauty and the Beast.' As may be supposed, the affair, which occurred in 1810, made a very great noise at the time; but the exhibition was soon brought to a close in a very summary manner by Mrs. Hope's brother, who mutilated the picture by thrusting his stick through the canvas. Dubost brought his action for the injury, but did not succeed in obtaining damages.

With the exception of a minor work entitled 'Modern Costumes,' in 1812, Mr. Hope did not publish anything further till 1819, when appeared his 'Anastasius, or Memoirs of a Modern Greek at the close of the Eighteenth Century,' but as his name was not attached to it, he was so far from being known or even suspected to be the author, that it was at first confidently attributed by many to Lord Byron, as the only person capable of having produced it. Of his two last works, both of them published posthumously, one of them was even still more remote from what may be supposed to have been the constant tenour of his studies, for that 'On the Origin and Prospects of Man' was almost the very last subject that would have been expected from his pen: from furniture to cosmogony the distance is immeasurable. Abstruse in its speculations, it was utterly unphilosophical in its matter, and being considered unorthodox in its opinions, it was afterwards withdrawn from publication; while his 'Historical Essay on

Architecture,' first published in 1835, on the contrary, became a popular work, and passed through three or four editions. Still it is nothing more than a mere essay, which touches indeed upon a good deal that is passed over in other treatises on the subject, yet very slightly; and towards the end it becomes very little more than a series of hasty fragmentary notes.

Besides the above works, Mr. Hope was author of several minor productions and pieces of criticism, one of them being a 'Letter to James Wyatt,' relative to his designs for Downing College, Cambridge, upon which he animadverted very freely, and apparently very justly. Another work—if so it may be called—of his, was his villa of Despdenne, in Surrey, which, if he did not entirely build, he very greatly enlarged, and embellished both the house and the grounds, which contain a handsome family mausoleum. Mr. Hope died Feb. 3, 1831.

HÔPITAL, GUILLAUME-FRANÇOIS-ANTOINE L', Marquis de Sainte Mesme and Count d'Entremont, commonly known as the Marquis de l'Hôpital, was born at Paris, in the year 1661, and died in 1704. He entered the army at an early age, and served during several years in the capacity of captain of cavalry; but the weakness of his sight and his desire to prosecute the study of the mathematics with less interruption than was compatible with active service, induced him to quit a profession in which he might otherwise have followed the footsteps of his ancestors. Among other anecdotes which are related in attestation of his early acquaintance with the mathematics, it is said that, at the age of fifteen, happening to be in company with a number of savans at the house of the Duke de Roannes, when great admiration was expressed of a solution which Pascal had recently given of a problem relative to the cycloid, L'Hôpital expressed his belief that the question was not beyond his own powers, and two days afterwards he supported his pretensions by answering it on different principles. The name of the Marquis de l'Hôpital is intimately connected with the early history of the differential and integral calculus. In 1691 no knowledge whatever of the calculus existed in France, and indeed throughout the Continent it appears to have been known only to Leibnitz, and to the brothers John and James Bernoulli. About this time John Bernoulli arrived at Paris, and spent some time at the residence of L'Hôpital for the purpose of giving him instructions in the differential and integral calculus. With such assistance, he was not long in becoming one of the first mathematicians of Europe, and he soon after distinguished himself by his solution of the great problem in mechanics relative to the brachystochron, or curve of quickest descent, which Bernoulli had proposed as a challenge to the geometers of the day, and to which, at the end of ten months, only four solutions had been given, by Newton in England, Leibnitz in Germany, James Bernoulli in Switzerland, and L'Hôpital in France. Still however the calculus was regarded as a sort of mystery by most of those mathematicians by whom it was not actually opposed; and with the exception of the papers by Leibnitz dispersed in the Acts of Leipzig, there existed no work from which any information could be obtained. To remedy this defect L'Hôpital wrote and published his 'Analyse des Infiniment-Petits,' which appeared in 1696, Paris, 4to. "The appearance of this work," says M. Bouchariat, "marked the epoch of a great revolution in science. Mathematicians hastened to initiate themselves into the wonders of the infinitesimal calculus, and doubts concerning its truth were advanced only by those who were blinded by their prejudices in favour of ancient methods." L'Hôpital has been accused by Montucla ('Histoire des Math.,' vol. ii. p. 397) of not having sufficiently acknowledged his obligations to John Bernoulli, from whom he is said to have derived the principal methods that are given in the work just mentioned; but M. Bouchariat is of a different opinion. The work itself has gone through several editions, of which the latest, we believe, is that edited by Lefèvre, in 1781. At his death in 1704, when only forty-three years of age, L'Hôpital left an 'Analytical Treatise on Conic Sections,' which was published in 4to, the following year, and was for a long time considered the best treatise on the subject. (A memoir of the family of BERNOULLI, omitted accidentally in its proper order, will be given with other supplementary notices.)

HOPITAL, or HOSPITAL, MICHEL DE L', born in 1505, near Aigueperse in Auvergne, was the son of Jean de l'Hôpital, physician to the Connétable de Bourbon, of whom he held a small estate. While L'Hôpital was studying law at Toulouse, his father was involved in the proscription of the Connétable, whom he accompanied to Italy; he was condemned to perpetual banishment, and his property was confiscated. His son, although only eighteen years of age, was arrested, examined, and kept for a short time in confinement. On being released, he went to Milan to join his father, who sent him to Padua to finish his studies. L'Hôpital remained in that celebrated university six years, during which the Connétable de Bourbon lost his life under the walls of Rome, and Jean de L'Hôpital found himself without a protector in a foreign land. He however took his son to Rome to see the coronation of Charles V., and it was in that city that the Cardinal de Grammont, the French ambassador, became interested in favour of the young man, and induced him to return to France, where he began to practise at the bar of the parliament of Paris. His merit, added to his having married the daughter of the lieutenant-criminel Morin, procured for him a seat on the bench of the councillors of the parliament, where, by his assiduity, his learning, and his

probity, he won the favour of the chancellor Olivier, and of Duchâtel, bishop of Tulle and librarian to Francis I. L'Hôpital was named ambassador to the Council of Trent, which had been just removed by the pope to Bologna; but the dissensions among the members of that assembly rendered his mission useless, and he was recalled to France by Henri II. The Duchess of Berry, daughter of Francis I., a princess fond of learning, invited L'Hôpital to her court, and recommended him to her brother the king, who appointed him superintendent of the finances. L'Hôpital endeavoured to check prodigality, mismanagement, and corruption, by which course he made himself many enemies. There was another subject upon which he differed from the court party, and that was the persecution to which the Protestants were subject. L'Hôpital, with several of his friends in the parliament, such as Du Ferrier, Paul de Foix, Christophe de Thou, and others, petitioned Henri II. to suspend the proscriptions and executions until the newly-assembled council should decide on the religious controversy; but the king considered their remonstrances as rebellious, and he ordered Montgomery, the captain of his guards, to arrest Paul de Foix, Louis du Faur, Anne du Bourg, and other members of the parliament. Du Bourg, who had spoken the most boldly, was soon after hanged, and his body burnt. During the minority of Francis II., a special court, appropriately called the 'burning-chamber,' was instituted to punish heretics. The Guises were now all-powerful in the state, and the chancellor Olivier himself signed the ordinance by which the Duke de Guise was appointed lieutenant-general of the kingdom. The old chancellor died soon after, and Catherine de' Medici, alarmed at the power of the Guises, chose L'Hôpital, of whose integrity she was assured, to replace him in 1560. His office was not an enviable one in those times. He strenuously opposed the Cardinal de Lorraine, who wanted to establish the Inquisition in France, and he proposed instead of it to give to the bishops cognisance of matters of heresy within their respective dioceses. This resolution was proclaimed in the edict called 'De Romorantin,' which the chancellor laid before the parliament to be registered, observing at the same time that opinions can only be subdued by exhortations and reasoning, and not by violence and persecution.

L'Hôpital's next thought was that of assembling the states-general, which had not met for eighty years, but the Guises opposed the proposal, which they feared would prove fatal to their power. L'Hôpital accordingly contented himself with assembling the nobility and high clergy at Fontainebleau. Francis II., with his wife Mary Stuart, presided in the assembly, and the chancellor made a report upon the state of the kingdom, and the religious and civil discontents which prevailed. Coligny next presented to the king two petitions from the Protestants of Normandy; and Montluc, bishop of Valence, and the archbishop of Vienne, strongly censured the system of persecution adopted against the Protestants; they spoke of the indulgence of the primitive church on similar occasions; they complained of the perpetual obstacles presented by the court of Rome to the convocation of a general council, which might restore peace to Christendom; and at last they proposed, as the only remedy to existing evils, the convocation of the states-general, and also of a national synod. The Guises consented to the first, but violently opposed the national synod as dangerous to the faith and the unity of the church. L'Hôpital hastened to obtain an edict from the king, convoking the states-general for the 10th of December 1560, at Orleans, and meantime suspending all prosecutions on charges of heresy. But in the interval Francis II. died, and Catherine de' Medici, regent for her second son Charles IX., hesitated about opening the assembly of the states. But the chancellor overcame her doubts and fears, and he opened the assembly with a speech in which he explained the numerous and important subjects which demanded the attention of the states, and above all, he insisted on the claims of the Protestants, censuring the spirit of persecution as unchristian and impolitic: "Let us do away," said he, "with those diabolical words of Lutherans, Huguenots, and Papists, names of party and sedition; do not let us change the fair appellation of Christians."

Each of the three orders composing the states now chose its own orator, and it soon became apparent that no harmony could prevail in the assembly. The orator of the third estate, or commons, without being favourable to the Protestants, loudly censured the scandalous and negligent conduct of the Roman Catholic clergy. The orator of the nobility, reflecting on the wealth and luxury of the church, demanded freedom of worship for the Protestants. The orator of the clergy maintained that heresy was a capital crime, and ought to be punished by the law, and at the same time he claimed exemption for his order from all taxes and other public burdens. The only useful result of the assembly was the passing of an ordinance prepared by L'Hôpital, which abolished arbitrary taxes, regulated the feudal authority of the nobles, and corrected many abuses in the judicial system. Soon after, July 1561, L'Hôpital obtained from the regent Catherine an edict, in the name of the king, ordering the release of all prisoners suspected of heresy. By another edict Roman Catholics were forbidden, under pain of death, from forcing an entrance into the houses of Protestants under pretence of dispersing their meetings. The parliament of Paris opposed these measures; but the chancellor prevailed, and the edicts were enforced. L'Hôpital was present at the conference of Poissy, where Beza and other

Protestant theologians argued on matters of doctrine against the Cardinal de Lorraine and other Roman Catholic divines, but which ended, as such meetings generally end, in mutual recriminations. In January 1562 L'Hôpital obtained from another assembly, consisting of deputations from all the parliaments of the kingdom, an edict of tolerance granting liberty of worship to the Protestants, except within the walled towns, and under the condition "that they should not teach anything contrary to the council of Nicea, or to the books of the Old and New Testaments." But soon after, the massacre of Vassy by the attendants of the Duke of Guise became the signal of fresh persecutions, followed by civil war. [GUISE.] After the death of the Duke of Guise, 1563, L'Hôpital prevailed upon Catherine to grant the edict "of peace," by which, among other conditions, all prisoners on both sides were released, and the Protestants were allowed the exercise of their religion within the towns which they had occupied during the war. He also prevailed upon Catherine to declare the majority of her son Charles IX., whom he afterwards induced to make a tour through the various provinces of the kingdom. The chancellor took this opportunity of reading some sharp lectures to the various parliaments, especially that of Bordeaux, which had encouraged persecution and civil war. In 1566 L'Hôpital again assembled the deputies from the various parliaments and the chief nobles at Moulins, where an ordinance was issued for the reform of justice, which is one of the best judicial regulations adopted in France previous to the reign of Louis XIV. Soon after the civil war broke out again, to the great sorrow of L'Hôpital, who endeavoured, during every cessation from actual fighting, to restore peace between the two parties. He thus became obnoxious to the Guises, who desired nothing less than the extermination of the Protestants. At last a bull came from Rome authorizing the king to levy 100,000 écus yearly on the revenues of the clergy, for the purpose and on the condition of rooting heresy out of his kingdom. The chancellor opposed the bull; he besought the king and his mother not to inundate France again with blood; he seemed to have prevailed, but soon afterwards the seals were taken from him, and he retired to his country-house at Vignay, in 1568, deploring the calamities of his country which he could no longer prevent. After some years of retirement the news of the St. Barthélemy massacre came to give the finishing blow to his exhausted frame. He was himself in danger of his life, but was spared through the influence of the Duchess of Savoy, the former duchess de Berry, his early benefactress. His only daughter, who had embraced the Reformed religion, was saved by the widow duchess of Guise, who concealed her in her hotel at Paris. L'Hôpital survived that horrible tragedy only six months; he died at Vignay on the 15th of March 1573. An upright and enlightened magistrate in an age of the worst corruption and ignorance, a benevolent Christian amidst the most furious fanaticism, his memory is deservedly consecrated in the annals of his country. His epistles in Latin verse, reflecting on public and domestic occurrences, were published, and are not without poetical merit. Several of his harangues and discourses have also been published, as well as his testament. His life has been written by Bernardi; and Villemain, in his 'Nouveaux Mélanges Littéraires,' has also written his biography.

HOPPER, THOMAS, architect, was born at Rochester, in Kent, on July 6th 1775 or 1776, and, according to a family tradition, was descended from a natural daughter of Richard III. Thomas Hopper, when very young, was placed under his father, a clever measuring surveyor, and it is believed he very soon had the chief duty and responsibility of the business. Thus led to direct his attention to architecture, he became in some degree a self-taught architect; and being about this time introduced to Mr. Walsh Porter, a friend of the Prince Regent, and a sort of authority in matters of taste, Hopper was so fortunate as to please Porter, and was employed by him in extensive alterations and decorations to his house at Fulham, called Craven Cottage. This house became a remarkable specimen of the 'cottage-ornée' style, afterwards so fashionable, and which Hopper perhaps was the means of introducing. The house contained a "robbers' cave," entered from the top; an octagonal vestibule, with the roof supported by palm-trees; a 'gothic' chapel with stained glass, and other whimsies; and externally presented the appearance of a thatched cottage, with trellis-work and creeping plants. Here the prince often supped. Hopper was made known to him, and was employed at Carlton House in some alterations, as well as on the Conservatory there—a sort of imitation of Henry the Seventh's Chapel, which was erected at one end of the lower suite of rooms, and used at the fête to the allied sovereigns in 1814. Here supper-tables were placed—down their length being a narrow tank for water, in which live fish disported. Hopper's taste, and the art of the day—the character of which last has been sufficiently pointed out above—were suited to one another; and, favourably introduced, and possessing great energy, a wonderful flow of conversation, and high spirits, it is not surprising that, at a time when there were fewer professional architects than there are now, Thomas Hopper should have speedily entered upon a large practice. Amongst the buildings of all kinds which he was employed in either erecting or altering, may be named—Slane Castle, in Ireland, for the Marquis of Conyngham; Penrhyn Castle, near Bangor, North Wales; Gosford Castle, Armagh; Easton Lodge, Dunmow, for Viscount Maynard; Leigh Court, near Bristol; the house at Kimmel Park, near

St. Asaph, for Lord Dinorben; one at Amesbury Park, near Salisbury; Danbury Palace, Essex; Gatton House, Surrey; Wyvanhoe Park; Llanover Court, Monmouthshire, for Sir Benjamin Hall; Stansted Park, near Havant, Hants; Margam, in South Wales; Alton Towers, Staffordshire; Rood Ashton, near Trowbridge; and many others of the same class—the works which were of the nature of alterations generally involving complete remodelling of the structure and of its architectural character. He attempted several different styles—the baronial castellated, then in favour, being of course amongst the number. Penrhyn Castle is perhaps the best exemplification of the latter kind of taste, and is indeed in many respects impressive in effect, and may be regarded as Hopper's best work. A vast amount was expended on it. He designed a baronial castle for the Duke of Atholl at Dunkeld in Scotland, which if completed would have rivalled Windsor Castle in extent, though the building never got beyond the foundations. He erected several prisons, amongst them the Essex County Gaol, to which afterwards he made alterations costing 40,000*l.* on its conversion for the cellular system. In London he was the architect of Arthur's Club-house in St. James's Street, the Legal and General Life Insurance Office in Fleet Street, and the Atlas Fire Office in Cheapside. His general manner for such buildings was derived from the class of edifices to which the Banqueting House, Whitehall, belongs. His last work, St. Mary's Hospital, Paddington, which is inferior in character, was designed and superintended by him gratuitously; but in it he met with much vexation and legal expense. He was for many years the county surveyor of Essex, and surveyor to the Atlas Fire Office. He was a competitor for the General Post Office in St. Martin's-le-Grand, when nearly one hundred designs, by eighty-nine competitors, were submitted. Sir Robert Smirke, who had not been a competitor, was ultimately engaged to erect the building; and Mr. Hopper contended that his design had been used, with the omission of some columns and of a few other features; and this, in a letter to Lord Melbourne in 1839, 'On the Building of the Royal Exchange,' he showed, by the aid of plans and elevations, might have been the case. He was also a competitor for the new houses of parliament, and published his designs in folio at some expense. Amongst many designs which he has left, are one for an alteration of the National Gallery, and another for a column of Victory to be erected in India with cannon placed in successive tiers, from the base upwards, of the shaft.

Although not possessing those high qualifications in art and science which the architect now strives to bring to his profession, Hopper's life is not the less an important one in the later history of architecture. He lived to enter the eighty-first or eighty-second year of his age, dying on the 11th of August 1856 at his cottage, which had been built by him, at Baywater Hill. In life, he possessed a frame which could support almost any amount of fatigue,—and although he was contemporary with the *bon vivants* of the Georgian era, he never drank anything but water. He practised athletic exercises with Jackson the boxer, and was active in command of a company of the volunteers. His features and form have been exactly given by Mr. J. Ternouth, the sculptor, in the relievo on the eastern compartment of the Nelson Column, to the sailor who is supporting a wounded boy. He was always connected with the leading personages of his day, and this circumstance afforded him inexhaustible anecdotes. The Prince Regent would have conferred on him the honour of knighthood, but this he declined, as well as offers from Alexander I, emperor of Russia and the Duchess of Oldenburg, for him to settle at St. Petersburg. The obituary notice in the 'Builder' (vol. xiv., p. 481)—the facts of which are apparently, like those above, derived from family sources—calls him "a man of mark and power," a conclusion which may help to justify the position which we have given to his name.

HOPPNER, JOHN, R.A., was born in London in 1769. "There is a mystery," says Cunningham (who however, it must be remembered, delighted in a bit of scandal), "about his birth, which no one has ventured to explain: all that is known with certainty is, that his mother was one of the German attendants at the Royal Palace." When young he was one of the choristers in the Chapel Royal. He studied afterwards in the Royal Academy of Arts; and before he was thirty years of age he had, owing to the active patronage of the Prince of Wales, painted more royal and noble portraits than usually falls to the lot of distinguished portrait-painters during the whole of a long life. Hopper soon distanced Opie and Owen in fashionable favour, and for eighteen years Lawrence was his only rival: Lawrence was patronised by the king, while the prince and his party patronised Hopper. Hopper's style is easy and effective, but gaudy; his heads have frequently much character, and are well modelled, though perhaps the opposite case occurs more frequently, especially in his male heads: he had also some skill in landscape painting. He died of dropsy in 1810. His son was for some years British consul at Venice.

At the exhibition of works of 'deceased British artists,' at the British Institution in 1817, there were seven portraits by Hopper, including his own, a very spirited work, which he presented to the Royal Academy in 1809, upon his election as a member of that body. His portrait of Nelson was in the exhibition at the same institution, in 1820, of 'Portraits representing distinguished persons in the history and literature of the United Kingdom:' it is however a less manly head than the one painted by Lemuel Abbot, which was engraved by J. Heath in 1801.

HORAPOLLO, or HORUS APOLLO, the author of a treatise on Egyptian Hieroglyphics. Several writers of this name are mentioned by Suidas, Stephanus of Byzantium under Phebethis, Photius (p. 536, ed. Bekker), and Eustathius (Hom., Od. Δ); but it is doubtful to which of them the treatise on Egyptian Hieroglyphics should be ascribed. According to the inscription, which is found in most manuscripts, the work was originally written in the Egyptian language, and translated into Greek by Philip. Horus was the name of one of the Egyptian deities, who was considered by the Greeks to be the same as Apollo. (Herod., ii. 144-156.) We learn from Lucian ('Pro Imag.', sec. 27) that the Egyptians were frequently called by the names of their gods. But whatever opinion we may form respecting the author, it is evident that the work could not have been written before the Christian era, since it contains allusions to the philosophical tenets of the Gnostics. The value of this work in interpreting existing hieroglyphics has been differently estimated. Champollion, Leemans, and other recent scholars are disposed to attribute greater importance to it than former critics had been willing to allow.

This work was printed for the first time by Aldus (Venice, 1505), with the Fables of *Æsop*. The best editions are by Mercer, 1651; Hoeschelius, 1695; De Pauw, 1727; and Leemans, Amst., 1834, who has discussed in his Introduction the date and authorship of the work; see also Bunsen's 'Aegyptens Stelle in der Weltgesch.', vol. i.

HORATIUS FLACCUS, QUINTUS, was born at Venusia, or Venusium, December 8, B.C. 65, during the consulship of L. Aurelius Cotta and L. Manlius Torquatus ('Carm.', iii. 21, 1; 'Epod.', xiii. 6). His father, who was a 'libertinus,' or freedman, had gained considerable property as a 'coactor,' or servant of the money-brokers (1 'Sat.', vi. 8, 86), with which he purchased a farm in the neighbourhood of Venusia, on the banks of the Aufidus. In this place Horatius appears to have lived till his eleventh or twelfth year, when his father, dissatisfied with the country school of Flavius (1 'Sat.', vi. 72), removed with his son to Rome, where he was placed under the care of a celebrated schoolmaster, Orbilius Pupillus, of Beneventum, whose life has been written by Suetonius ('De Illust. Gramm.', c. 9). After studying the ancient Latin poets (2 'Ep.', i. 70, 71), Horatius learned the Greek language (2 'Ep.', ii. 41, 42). He also enjoyed during the course of his education the advice and assistance of his father, who appears to have been a sensible man, and who is frequently mentioned by his son with the greatest esteem and respect (1 'Sat.', iv. 105-121; vi. 76-89). It is probable that soon after he had assumed the toga virilis, at the age of about seventeen, he went to Athens to pursue his studies (2 'Ep.', ii. 43-45), where he appears to have remained till the breaking out of the civil war during the second triumvirate. In this contest he joined the army of Brutus, was promoted to the rank of a military tribune (1 'Sat.', vi. 43), and was present at the battle of Philippi, B.C. 42 ('Carm.', ii. 7, 9). Though the life of Horatius was spared, his paternal property at Venusia was confiscated (2 'Ep.', ii. 49-51), and he repaired to Rome with the hope of obtaining a living by his literary exertions. Some of his poems attracted the notice of Virgil and Varius, who introduced him to Mæcenas, whose liberality quickly relieved the poet from all pecuniary difficulties. (1 'Sat.', vi. 54-62; 'Epod.', i. 31, 32; 'Carm.', ii. 18, 11-14; iii. 16, 37-38.)

We are informed by Suetonius, in his life of Horatius, that he purchased a place as clerk in the treasury. From his introduction to Mæcenas till the time of his death Horatius appears to have enjoyed exemption from all cares: he was intimate with Virgil, Tibullus, and other distinguished literary men in Rome, and was a great favourite of his patron Mæcenas and also of Augustus. He resided principally at Rome, or at his country-house in the Sabine Valley, which had been given him by Mæcenas. He also had in the latter part of his life another country residence at Tibur, or, as it is now called, Tivoli. The fact of his having a house at the last place, though denied by some critics, is abundantly established by many passages in his works. ('Carm.', i. 7, 10-14; ii. 6, 5-8; iii. 4, 21-24; iv. 3, 10-12; 1 'Ep.', vii. 44, 45; viii. 1, 2.) Horatius died on the 27th of November, B.C. 8, when he had nearly completed his fifty-eighth year.

Many critics have maintained that each ode, each satire, &c., was published separately by Horatius; but Bentley, in the Preface to his edition of the poet's works, argues from the words of Suetonius, the practice of other Latin poets, and the expressions of Horatius himself ('Carm.', i. 1; ii. 20; iii. 30; 'Epod.', xiv. 7; 1 'Sat.', x. 93; ii. 1; 'Ep.', i. 1; i. 20), that his works were originally published in books in the order in which they now appear. He maintains that the first book of the 'Satires' was composed B.C. 40—38; the second book B.C. 35—33; the 'Epodes' B.C. 32—31; the first book of 'Odes' B.C. 30—28; the second book B.C. 26—25; the third book B.C. 24—23; the first book of 'Epistles' B.C. 20—19; the 'Carmen Sæculare' and the fourth book of 'Odes' B.C. 17—16; the second book of 'Epistles,' and the Epistle to the Pisos, called 'De Arte Poetica,' were written last, but at what period is uncertain. The works of Horatius have been printed in this order by Mr. Tate, under the title of 'Horatius Restitutus, or the Books of Horace arranged in chronological order,' Camb., 1832, 2nd edit., 1837, with a preliminary dissertation, in which he brings forward many reasons for adopting the order of Bentley.

The poetry of Horace is differently estimated according to the taste of each individual. In our opinion the Satires and Epistles, which are familiar moral discourses, and are hardly worthy of the name of

poetry, according to the usual acceptation of the word, are by far the most valuable of his works. The Odes, which for the most part are little more than translations or imitations of the Greek poets, are generally written in a very artificial manner, and seldom depict the stronger and more powerful feelings of human nature. The best are those in which the poet describes the pleasures of a country life, or touches on the beauties of nature, for which he had the most lively perception and the most exquisite relish ('Epod.,' 2); nor are his lyrical productions altogether without those touches which excite our warmer sympathies. But if we were to name those qualities in which Horace most excels, we should mention his strong good sense, his clear judgment, and the purity of his taste. Many readers, we are aware, attribute still greater merit to the poetry of Horace than we are disposed to allow.

The following are the most esteemed editions of Horace:—Lambinus, 1561; Heinsius, 1629; Bentley, 1711; Burmann, 1713; Sanadon, 1723; Mitscherlich, 1800; the edition of Baxter, edited by Gesner and Zeune, frequently printed; Döring, 1828-29; Braunhard, 1833. Milman's 'Life and Works of Horace,' London, 1849, is an eminently beautiful work. Horace has been translated into almost all the European languages, both in prose and verse. A few of the Odes and Satires have been well translated into English, especially those freely rendered by Pope and Swift; but there is no good translation in English of the whole of his works. That of Francis (4 vols. 12mo, 1747) is a poor and lifeless performance.

HORMISDAS, a native of Frusino, succeeded Symmachus in the see of Rome in 514. Theodoric was then king of Italy, and under his wise administration the country enjoyed peace and prosperity. Theodoric made valuable presents to Hormisdas to adorn the basilica of the Vatican. Hormisdas repeatedly sent legates to Constantinople to the Emperor Anastasius II. and his successor Justinus, in order to put an end to the schism between the Greek and the Roman churches which had originated with the patriarch Acacius. [GELARIUS I.] A reconciliation was effected, at least for a time. Hormisdas died in the year 523, and was succeeded by John I.

HORNE, GEORGE, D.D., Bishop of Norwich, was born November 1, 1730, at Otham, near Maidstone in Kent. At the age of thirteen he was sent to school at Maidstone, under the care of the Rev. D. Bye, and at fifteen was removed to University College, Oxford. He was afterwards elected a Fellow of Magdalen; of which college he was appointed principal in 1768. In 1776 he was vice-chancellor; and was appointed dean of Canterbury in 1781, and bishop of Norwich in 1789. He died January 17, 1792, in his sixty-second year.

Dr. Horne paid particular attention to the study of Hebrew and sacred literature; in which he adopted many of the principles of Hutcheson. His works, which are numerous, consist principally of sermons and pamphlets relating to questions which have long since been settled; of which a list is given by Jones in his edition of Horne's Works, 6 vols. 8vo, 1795. The most celebrated of Horne's works is his 'Commentary on the Book of Psalms,' which was originally published at Oxford, 2 vols. 4to, 1776, and has since been frequently reprinted. (Jones's *Life of Horne*.)

HORNE, REV. THOMAS HARTWELL, was educated at the Charterhouse School, London. The death of his parents deprived him of the opportunity of prosecuting his studies at one of the universities, but having published the first edition of his 'Introduction to the Scriptures,' the Bishop of London thought so well of it as the production of a layman that he admitted Mr. Horne to holy orders without the usual preliminary step of his having taken a degree. He afterwards received the degree of B.D. from St. John's College, Cambridge, and that of D.D. from Washington College, Hartford, Connecticut, and also from the university of Pennsylvania. The Bishop of London presented him to the rectory of the united parishes of St. Edmund the King and St. Nicholas Acons, London, and he has since been made a prebendary of St. Paul's Cathedral. Dr. Horne's great work is the 'Introduction to the Critical Study and Knowledge of the Holy Scriptures,' 5 vols. 8vo, 9th edit. 1846, much improved and enlarged since the first edition, which was in 2 vols. 8vo, London, 1813. Besides the extensive circulation which this work has obtained in the universities and other theological seminaries of the United Kingdom, it has been adopted as a text-book in various universities and colleges in North America. The most important of his other works are the following: 'A Compendious Introduction to the Study of the Bible, being an Analysis of the Introduction to the Holy Scriptures,' 12mo, 1827; 'Deism Refuted, or Plain Reasons for being a Christian,' 12mo, 1819; 'Romanism contradictory to Scripture; or the Peculiar Tenets of the Church of Rome, as exhibited in her accredited Formularies, contrasted with the Holy Scriptures,' 12mo, 1827; 'Mariolatry; or Facts and Evidences demonstrating the Worship of the Blessed Virgin Mary by the Church of Rome; derived from the Testimonies of her reputed Saints and Doctors, from her Breviary and other authorised Formularies of Devotion, confirmed by the Attestations of Travellers,' 2nd edit. 1841; 'The Scripture Doctrine of the Trinity briefly stated and defended, and the Church of England vindicated from the Charge of Uncharitableness in retaining the Athanasian Creed,' 12mo; 'A Manual of Parochial Psalmody,' 18mo, 1820; 'A Manual for the Afflicted,' 18mo, 1832; 'A Manual of Biblical Biography,' 8vo; 'A Protestant Memorial,' 12mo.

*HORNE, RICHARD HENRY, was born about the commencement of the present century. He was for a short time at Sandhurst, in expectation of a military appointment in the East India Company's service; but when he left that school, he entered into the Mexican service as midshipman, in which he remained until the termination of the war with Spain. On the conclusion of the war Mr. Horne turned his attention to literature. After contributing to the periodicals of the time, he wrote several dramas on the Elizabethan models, which he had already largely extolled. 'The Death of Marlowe,' and 'Cosmo de Medicis,' both published in 1837, were followed by 'The Death Fetch,' and, in 1840, by 'Gregory the Seventh,' to which was added a critical essay on Tragic Influence. About this time Mr. Horne published a work called 'An Exposition of the False Medium, excluding Men of Genius from the Public,' in which he endeavours to show that the external machinery of literature deprives it of much of its internal influence. These views were probably derived from his own experience mainly, for it is evident that the works of Mr. Horne did not sell. He had founded, or allied himself with, a body of literary men holding peculiar views, and calling themselves Syncretics, who, admired and followed by a few, were derided or neglected by the many. Mr. Horne's next work was a 'Life of Napoleon' (Tysse's Illustrated Edition), published in 1841; and in 1843 much merriment was excited by the announcement, 'Orion: an Epic Poem. Price One Farthing.' It was understood as an indignantly sarcastic concession to the public appreciation of the value of such things. However, a very large number of farthing copies were sold; subsequent editions at a penny, at half-a-crown, and at five shillings, made 'Orion' a good speculation, and secured its perusal by numbers who consider it one of the best epics of modern times. It contains lines which have passed into daily use. This was followed next year by 'A New Spirit of the Age,' 2 vols., a work on the principle of Hazlitt's 'Spirit of the Age.' It contains some fine criticisms of modern writers, with, of course, many exaggerative pros and cons, sins of omission and commission. 'Ballad Romances' followed in 1846; 'Judas Iscariot, a Miracle Play, with Poems,' in 1848; 'The Poor Artist; or Seven Eyesights and one Object,' in 1850; and 'The Dreamer and the Worker, a Story of the Present Time,' 2 vols., in 1851. Mr. Horne has edited 'The Monthly Repository,' and contributed largely to the 'Church of England Quarterly,' the 'New Quarterly,' and to 'Household Words.' His last dramatic work, 'Alsargis,' was produced in the present year, 1856, at Drury Lane Theatre. In 1852 Mr. Horne accompanied Mr. Howitt and some other friends to Australia, and met with various fortunes. Finding the labours and privations of gold-digging too severe, he became consecutively a Chief of Mounted Police, and a Gold Commissioner. Some of his experiences may be traced, anonymously, in 'Household Words.'

HORNE TOOKE. [TOOKE.]

HORNER, FRANCIS, was born on the 12th of August 1778, in the city of Edinburgh, where his father was a merchant. He was educated at the High School of Edinburgh; in 1792 he matriculated at the University of Edinburgh, where he pursued his studies till the summer of 1795. He was then seventeen years of age, and being disposed to select the law as his profession, his father sent him to England, and placed him under the care of the Rev. John Hewlett, of Shacklewell, Middlesex, in order that he might get rid of his Scottish dialect, and gain some experience among strangers, as he had hitherto constantly lived at home. He returned to Edinburgh in November 1797, and having fixed upon the Scottish bar as his profession, at the age of twenty he laid down for himself a scheme of study which included almost every branch of science and literature. He studied Scotch law with his friend Henry Brougham, and with another friend, Lord Webb Seymour, he studied metaphysics and political economy.

In 1802 Horner began to have thoughts of exchanging the Scottish, for the English bar, and in April of that year he came to London in order to observe the proceedings in the courts of law, and fix his determination. His friendships and political opinions had associated him with the rising Whigs in Edinburgh; he was now received with alacrity by men of congenial opinions in London—by Mr. Abercrombie, Sir James Mackintosh, Sir Samuel Romilly, and others. He resolved to attach himself to the English bar, and in the spring of 1803 he took up his permanent residence in London. It was an eventful and a stirring time. The French war was again breaking out, the king's sanity was doubtful, and the Addington administration was giving way before the cross-firing of Pitt and Fox. Horner was not allowed to remain an unengaged spectator. As his abilities became more known, his connections with the leading Whigs were extended. On the death of Pitt in 1806 the government was placed in the hands of Lord Grenville and Mr. Fox. Horner accepted a seat at the Board of Commissioners established by the East India Company for settling the Nabob of Arcot's debts, an unsalaried office, which however was to be remunerated at the close of the investigation. On the 23rd of June 1806 Lord Henry Petty made him an offer, through the intervention of Lord Kinnaird, of a ministerial seat in the House of Commons, which, after consultation with his friends, was accepted, and in November 1806 he was returned for St. Ives. Fox had died in September, and the old Whig party, which he had held together, immediately fell to pieces. A new parliament was summoned, and met on the 15th of December. This parliament was very short-lived.

A change of ministers took place on the 24th of March 1807; parliament was prorogued on the 27th of April, and was immediately afterwards dissolved. Horner did not obtain a seat at the general election, but in the following July was elected for the borough of Wendover through the interest of Lord Carrington. He spoke little at first, on matters of business only, and briefly. By degrees he began to take a part in great questions. He entirely coincided with the Whig party in their condemnation of the seizure of the Danish fleet; he differed from them in their shrinking policy on the question of the Spanish war. In May 1809 he resigned his seat at the Board of Commissioners for investigating the debts of the Nabob of Arcot, in consequence of finding its duties interfere too much with the pursuit of his profession. On the 1st of February 1810 Horner made a motion for an inquiry into an alleged depreciation of bank-notes. The subject was one which he had studied extensively, and he made a decided impression on the House. He was appointed a member of the Bullion Committee, and by the part which he took in it, by his share in drawing up the report, and by his speeches on the question in the House, he acquired a solid reputation and a position and influence there which he afterwards rather augmented than diminished. On the Regency question he spoke on the side of his friends with great power and effect. In the negotiations for the formation of a ministry by Lord Grenville in 1811, Horner was offered the situation of one of the Secretaries of the Treasury, but he declined the offer. In the general election in 1812 he was not returned as a member, but by the intervention of Lord Grenville he was elected for St. Maves, through the interest of the Marquis of Buckingham. In the sessions of 1813 and 1814 he took a prominent part in the debates, and became one of the acknowledged leaders of his party. He took advantage of the opening of the continent in 1814, and made the tour of Geneva and the north of Italy. In the great crisis arising from the return of Bonaparte from Elba, when Lord Grenville urged the necessity of a war, and Lord Grey deprecated the haste with which the country seemed disposed to enter upon it, Mr. Horner supported Lord Grey, and the difference of opinion seemed to be so irreconcilable that he offered to surrender his seat, but the Marquis of Buckingham declined to accept his resignation. On the 25th of June 1816 he made his last speech in parliament, in favour of the Catholic claims, and against the harsh treatment which Ireland had experienced from the government of this country. Symptoms of a pulmonary disease had already begun to show themselves in his constitution, and he was advised by his physicians to spend the winter in the South of Europe. Accompanied by his brother, Mr. Leonard Horner, he set out on his journey, and arrived at Pisa in the latter part of November. His disease grew rapidly worse, but he had no suspicion that it was dangerous, and he continued to lay down for himself plans for future studies of the most comprehensive extent. On the 6th of February his difficulty of breathing came on with increased severity. He died on the 8th of February 1817. His body was opened, and his complaint was found to be, not consumption, but induration of the substance of the lungs and enlargement of the air-cells to an extraordinary extent. He was buried in the Protestant cemetery at Leghorn, where a marble table-tomb was erected to his memory by his father. At one of the ends of the monument is a likeness of him in relief, of the size of life, by Chantrey. A marble statue of him, also by Chantrey, is placed in the north transept of Westminster Abbey, the cost of which was defrayed among his personal and political friends. It is one of Chantrey's best works, and indeed one of the finest portrait-statues in the Abbey.

The character of Horner's understanding was that of vigorous reasoning in pursuit of important and often difficult truth. He had no wit, and made no pretence to any. His knowledge was extensive, and his judgment accurate, not only in the various branches of political economy, but in a great many other departments of literature. He was one of the projectors of the 'Edinburgh Review,' and wrote many articles for it. As a public man his independence was unquestionable; his integrity, sincerity, and moderation were acknowledged by all parties. He was modest, free from pretension, and equally free from any kind of affectation or any trace of rancour. As a public speaker he was grave and forcible, without imagery or any of the accessories of oratory, but with an earnestness and evident sincerity of manner which produced an effect greater than he could have done by any appeals to the imagination or the passions.

(*Memoirs and Correspondence of Francis Horner, M.P.*, edited by his brother, Leonard Horner, Esq., F.R.S.)

* HORNER, LEONARD, the younger brother of Francis Horner, whose 'Memoirs and Correspondence' he edited in 1843, was born in Edinburgh, and was there educated. His eminent brother, as we may judge from several interesting letters dated 1811, speaks most encouragingly of the advance which Leonard had made in his favourite pursuit of geology, and especially of the merits of a paper which he had written, 'On the Mineralogy of the Malvern Hills.' Another letter also shows the interest which the younger brother had taken in the education of the people. On the formation of the London University, in 1827, Mr. Leonard Horner was placed in the responsible position of warden; and much of the organisation of that novel and important institution was the result of his labours. He indicated his desire to diffuse a knowledge of geological science by some admirable papers on 'The Mineral Kingdom,' published in 'The Penny Maga-

zine' in 1833-34. In 1833 the Factories' Act of 3 William IV. was passed, and Mr. Horner became one of the principal inspectors under that important statute. He has continued in that office to the present time, manifesting an unremitting solicitude for the health and moral and physical improvement of the great body of factory-workers, particularly of the thousands of children, of whom the state had assumed the duty of protector. In the course of his official career, he has occasionally had to encounter opposition from those who thought that their commercial interests were interfered with in the strict enforcement of the law, particularly with regard to the fencing of machinery for the prevention of accident. But whatever difference of opinion there may be on this subject, there can be no doubt that Mr. Horner has been a material instrument in promoting that kindly regard for the welfare of the operatives which must henceforth be aimed at in every well-regulated factory. Besides the 'Memoirs and Correspondence' of his brother, Mr. Horner is the author of various scattered writings on scientific and philanthropic subjects. Among these may be mentioned 'Remarks on Certain Charges of Misrepresentation of Lord Brougham's Education Bill in the Edinburgh Review, January 1838;' a treatise 'On the Employment of Children in Factories and other works,' 1840; and 'An Address delivered at the Anniversary Meeting of the Geological Society of London,' of which he was president, in 1847. He is a Fellow of the Royal Society.

HORREBOW, PETER, a Danish astronomer, was born in the year 1679. After studying medicine for several years he became the pupil of the celebrated mathematician and astronomer Olaus Roemer, whom in 1710 he succeeded as professor in the University of Copenhagen. The duties of this office he continued to discharge with great credit till about the year 1740, when he resigned in favour of his son Christian. Horrebow died at Copenhagen in 1764, at the advanced age of eighty-five years. His works are—'Clavis Astronomiæ, seu Astronomiæ Pars Physica,' Copenh., 1725, 4to, an attempt to explain the formation of the planets on the system of Descartes; 'Copernicus triumphans, sive de Parallaxi Orbis Anni Tractatus Epistolaris,' ib. 1727, 4to, in which he imagines himself to have proved, from Roemer's observations, that Sirius and a Lyrae have each 30" of annual parallax; 'Atrium Astronomiæ, sive Tractatus de inveniendis Refractionibus, Obliquitate Eclipticæ, atque Elevatione Poli,' ib. 1732, 4to; 'Basis Astronomiæ, sive Astronomiæ Pars Mechanica,' ib. 1735, 4to; 'Consilium de novâ Methodo Paschali ad perfectum Statum perducendâ, ac deinceps omnibus Christianis commendandâ,' ib. 1738; 'Elementa Philosophiæ Naturalis,' ib. 1743, 4to; besides a few papers upon astronomical subjects in the 'Acts of Leipzig.' His works were collected and reprinted in 1740-41, at Copenhagen, in 3 vols. 4to. To his 'Basis Astronomiæ' is prefixed the 'Life of Roemer,' in which he has omitted nothing that could tend to perpetuate the memory of his predecessor.

HORREBOW, CHRISTIAN, son of the above, died in 1776, and, besides a Latin treatise on Spherical Trigonometry, he has left, 'Repetita Parallaxios Orbis Anni Demonstratio, ex Observationibus Ann. 1742 et 1743 deducta,' Copenh., 1744, 4to; and 'De Parallaxi Fixarum Annuâ et Rectascensionibus quam post Roemerum et Parentem demonstrat Auctor,' ib. 1747, 4to.

HORROCKS, JEREMIAH, often spelt HORROX, an astronomer who has obtained a lasting celebrity, though he died at the age of twenty-two, or thereabouts. During the time in which the court and parliament were occupied in the disputes which led to civil war, four men, three of them very young, and all personally acquainted with each other, were employed in advancing the theory and practice of astronomy. Three of them died very young, and their names had almost perished, and would probably have been lost, but for the more than usual talents of Horrocks. We have therefore reserved for this article the account of three of them; the fourth is noticed in a separate article. [GASCOYNE, WILLIAM.] They were made known to each other by Christopher Townley, of Carr in Lancashire, who was the particular friend of Edward Sherburne, the translator of Manilius (1675). This latter writer thus obtained some particulars of them, from which, with other sources, our account is taken.

1. JEREMIAH HORROCKS was born, it is supposed, about the year 1619, at Toxteth, near Liverpool. His father, a man of moderate means, placed him, before 1633, at Emanuel College, Cambridge, and there he soon began to turn his attention to astronomy. In the prolegomena to his astronomical writings he describes the difficulties under which he laboured in finding even so much as a direction to good authors. A treatise by Gellibrand led him to purchase the writings of Lansberg, on which he afterwards greatly regretted that he had wasted his time. Subsequently he became acquainted with those of Tycho Brahe and Kepler. Though his papers which he left behind him contain many good observations and ingenious remarks, he must now be considered as known by two particulars. He was the first who saw Venus on the body of the sun, and he was the first who remarked that the lunar motions might be represented by supposing an elliptic orbit, provided that the eccentricity of the ellipse were made to vary, and an oscillatory motion given to the line of apices. Newton afterwards showed that both suppositions were consequences of the theory of gravitation, and (book iii, prop. 36, scholium) attributes to Halley a part of what is really due to Horrocks, as explained by Flamsteed. But Horrocks has been more than avenged

by the foolish statement of Martin, in his 'Biographia Philosophica,' that Newton made Horrocks's theory the "groundwork of all his astronomy." This palpable misconception was copied by Dr. Hutton into his 'Mathematical Dictionary.'

The account given by Horrocks of his observation of Venus, November 24, 1639, entitled 'Venus in Sole visa,' was printed by Hevelius at the end of his 'Mercurius in Sole visus,' published at Danzig in 1662. The remainder of the works of Horrocks were published by Dr. Wallis, London, 1672, some copies bearing the title-page 'Opera Posthuma,' and others 'Opuscula Astronomica.' The lunar theory of Horrocks was there developed by Flamsteed, but Wallis afterwards added the original letter to Crabtree, in which it was contained, but only to some copies, which therefore exhibit certain pages (pp. 465-470) twice over. Lalande states that he had a copy with a third title-page, dated 1678, and containing some additional tracts of Wallis. This publication contains various astronomical tracts, with extracts from the letters of Horrocks to Crabtree.

The death of Horrocks took place January 3, 1641 (old style). Costard ('Hist. Astron.') calls him a young clergyman, but we cannot find that he was in orders. In the 'Companion to the Almanac' for 1837 will be found a list of the astronomical works in his possession, taken from a list written by himself at the end of his copy of Lansberg's 'Tabulæ Perpetuæ,' which was preserved by his friend Townley. The spelling of his name is taken from his own handwriting in this work.

2. WILLIAM CRABTREE, who died a few months after his friend Horrocks, at a very early age, was a clothier at Broughton near Manchester, and many of his observations were printed by Wallis in the work above cited, and afterwards in the discussion about Gascoygne, presently to be mentioned.

3. WILLIAM MILBOURN, curate at Brancespeth near Durham, was, according to Sherburne, well versed in algebra, having extracted the approximate root of an equation of the fifth degree before he had seen Hariott's work. In astronomy he had, by his own observations, detected the errors of Lansberg's tables, and verified those of Kepler. His observations were destroyed by the Scots in the year 1639, and some tables which he had sent to London for publication, were, in 1676, in the hands of Sir Jonas Moore.

4. WILLIAM GASCOYGNE, of Middleton in Yorkshire, the fourth of these friends, as already mentioned, is noticed under his own name. We may just add to what is there said, that though it appears now to be generally admitted that Gascoygne was the original inventor of the wire micrometer, of its application to the telescope, and of the application of the telescope to the quadrant; it is also admitted that the invention was never promulgated, even in England, until the undoubtedly independent inventions of Auzout and Picard had suggested their publication.

Sherburne particularly mentions these four, with some others of less note, in consequence of an assertion of Wallis, in his edition of Horrocks, that there were very few of that day in the north of England who cultivated the sciences. Among the lesser stars was JEREMIAH SHACKERLEY, whose 'Tabulæ Britannicæ,' published at London in 1653, were compiled mostly from papers of Horrocks, which were afterwards destroyed in the great fire of London. The rest of Horrocks's papers were rescued by Dr. John Worthington, afterwards rector of Hackney, from Crabtree's representatives.

* HORSLEY, JOHN CALLCOTT, A.R.A., was born in London in January 1817. Trained to art from childhood, Horsley became a contributor to the various pictorial exhibitions while quite a youth; but the works which first attracted notice, beyond his own friendly circle, were the 'Contrast' and 'Leaving the Ball,' exhibited at the Royal Academy in 1840, and belonging to a sentimental style at that time much in vogue. Other works similar in style engaged the young artist's pencil, till the proposals put forth by the Commission of the Fine Arts, in connection with the decoration of the new houses of parliament, incited him to a bolder flight. At the Cartoon Competition of 1843 Mr. Horsley, by his cartoon of 'St. Augustine Preaching,' secured one of the three second-class prizes of 200*l.*; and in the succeeding Fresco Competition he was one of the six artists who obtained commissions to prepare designs for executing in the House of Lords. The subject assigned to him was the 'Spirit of Religion,' and his design being approved, he painted it in fresco in one of the arches over the Strangers' Gallery in the peers' chamber. He has since painted another fresco in the Poets' Hall, 'Satan surprised, at the ear of Eve.' Mr. Horsley's principal cabinet pictures, painted since the completion of his frescoes, have been—'Malvolio i' the Sun,' exhibited at the Royal Academy, in 1849; 'Hospitality—the Mote at Ightham,' 1850; 'L'Allegro and Il Penseroso,' painted for Prince Albert, and 'Youth and Age,' 1851; 'Master Slender' and the 'Madrigal,' 1852; 'Lady Jane Grey and Roger Ascham,' 1853; 'Scene from Don Quixote,' 1855—the most original and masterly of the genre pictures Mr. Horsley has yet painted; and the 'Administration of the Lord's Supper,' 1856. Mr. Horsley was elected an associate of the Royal Academy in 1855.

HORSLEY, SAMUEL, a distinguished prelate of the English Church, successively Bishop of St. David's, Rochester, and St. Asaph, was born in 1733. He was the son of John Horsley (whose father was originally a Nonconformist), who was for many years the clerk in orders at St. Martin's-in-the-Fields, and who held two rectories, Thorley in Hertfordshire, and Newington Butts in Surrey. The bishop was educated

at Westminster School, whence he passed to Trinity Hall, Cambridge, and had the rectory of Newington, which his father resigned to him soon after he had taken orders in 1759.

His more public career he may be said to have commenced in 1767, when he was elected a Fellow of the Royal Society, to which body he became the secretary in 1773. His earliest publications were certain small tracts on scientific subjects, but in 1776 he projected a complete and uniform edition of the philosophical works of Sir Isaac Newton. This design was not accomplished till 1784, when the fifth and last of the five quarto volumes made its appearance.

In the earlier years of his public life he found patrons in the Earl of Aylesford, and in Lowth, bishop of London; but we pass over, as uninteresting and unimportant, the presentations to his various livings, and the dispensations which the number of his minor preferments rendered necessary. In 1781 he was appointed Archdeacon of St. Albans. It was a little before the date last named that he first appeared in the field of theological controversy, in which he soon showed himself a very powerful combatant—powerful from the great extent of his knowledge and from the vigour of his intellect. The person against whom he chiefly directed his attack was Dr. Joseph Priestley, who in a series of publications defended with great subtilty and skill the doctrines of philosophical necessity, materialism, and Unitarianism. Dr. Horsley began his attack in 1778 on the question of 'Man's Free Agency'; it was continued in a 'Charge' delivered in 1783 to the clergy of his archdeaconry, in which he animadverts on many parts of Dr. Priestley's 'History of the Corruptions of Christianity.' This charge produced a reply from Dr. Priestley, which led to a rejoinder from Dr. Horsley in 'Seventeen Letters to Dr. Priestley,' a work which was regarded by the friends of the Church as a masterly defence of the orthodox faith, and as the secure foundation of a high and lasting theological reputation.

The tide of preferment now began to flow in upon him. Thurlow, who was then chancellor, presented him with a prebendal stall in the church of Gloucester, observing, as it is said, that "those who defended the Church ought to be supported by the Church;" and in 1788 he was made bishop of St. David's. In parliament he distinguished himself by the hearty support which he gave to the measures of Pitt's administration, and some of his declarations of political sentiment were thought by many persons to be as little in accordance with the true spirit of the English constitution as with the spirit of Christianity itself. But in judging on such a point as this the circumstances of the times are to be considered, opinions as strong in another direction being by many persons promulgated, and a disposition manifested by some to act according to them. His political conduct however gained him the favour of the court: in 1793 he was translated to Rochester, and in 1802 to St. Asaph. He died in 1806.

We have mentioned but a few of his published writings, which are very numerous; but a complete list may be found in Nichols's 'Literary Anecdotes of the Eighteenth Century.'

HORTENSIUS, QUINTUS, born B.C. 114 of an equestrian Roman family, began to plead at a very early age, and he had already attained a great reputation in his profession when Cicero made his appearance in the Forum. From that time Cicero and Hortensius were considered as professional rivals, but they lived on friendly and even intimate terms with each other, as Cicero acknowledges in several of his writings. At the beginning of his book 'De Claris Oratoribus,' Cicero pays an eloquent and apparently sincere tribute of praise to the memory of Hortensius, who was then lately dead. He styles him his friend and adviser, who often assisted him in their common career, "being not, as many imagined, a rival or detractor of his fame, but a fellow-labourer in a glorious vocation;" and yet in some of his letters (Epist. iii. of the 1st book 'Ad Quintum Fratrem') Cicero had bitterly complained of the duplicity and ungenerous conduct of Hortensius towards him when he was obliged to quit Rome in the Clodian business. Hortensius went through the regular career of public offices and honours; he was made in succession quaestor, ædile, prætor, and lastly consul, with Q. Cæcilius Metellus Creticus, B.C. 69. He appears to have acquired great wealth, which he spent liberally, and yet bequeathed an ample inheritance to his children. His villas at Tusculum, at Bauli, at Laurentum, and other places, are mentioned as splendid. He is charged by Cicero with having used bribery and other means to gain his causes, and to have received presents from his clients. Hortensius died B.C. 50, while Cicero was returning from his government of Cilicia (Epist. vi. of the 6th book 'Ad Atticum'; 'Brutus,' c. 64, 94); and Cicero considers it a continuation of the good fortune which had attended him through life, that he died just before the breaking out of the civil war, and was thus spared the grief of seeing the fall of the republic. The 'Orations' of Hortensius which are mentioned by Cicero and Quintilian are lost, as well as his 'Annals,' and some erotic poems which he is said to have written. Cicero ('Brutus,' c. 92, 95) has given his opinion of the character of Hortensius as an orator.

HOSEA, one of the twelve minor Hebrew prophets. We possess no particulars respecting the place of his birth, or his history; but it appears probable that he was a native of Samaria, since his prophecies relate principally to the ten tribes. We learn from the inscription of the book that he was the son of Beeri, and that he lived "in the days of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah, and in the days of Jeroboam the son of Joash, king of Israel."

The reign of Jeroboam II. lasted from B.C. 823 to 783; and that of Hezekiah began B.C. 726. It is therefore evident, if this inscription is correct, that Hosea could only have entered upon his prophetic duties in the latter part of the reign of Jeroboam; which supposition is also rendered probable by the tenor of his prophecies, which describe the kingdom of Israel as in a weak and divided state, and obliged to seek assistance from foreign powers; whereas in the book of Kings (xiv. 25-28) the affairs of the kingdom of Israel are represented as in a very prosperous condition during the reign of Jeroboam II. But the prophecies of Hosea are quite in accordance with the period of anarchy and foreign invasion which followed the death of Jeroboam II. (2 Kings, xv. xvi.) It is therefore probable that the prophecies of Hosea extended over a period of about sixty years (B.C. 784-724); and that he was contemporary with Isaiah, Micah, and Amos.

The principal object of the prophecies of Hosea is to reprove the people of Israel on account of their sins; and to denounce the divine judgments which awaited them if they continued disobedient. The book may be divided into two parts; in the first of which, the prophet, under the supposed infidelity of his wife, represents the spiritual infidelity of the children of Israel, and foretells the judgment of God against them, and at the same time promises that God would at some future period receive them again into his favour (c. i.-iii.). In the second part, this symbolical representation is dropped; and the prophet foretells in express language that the country would be devastated by the Egyptians and Assyrians, and that the people would be carried away into captivity; and he concludes with an exhortation to repentance, and a promise that God "would heal their backslidings, would love them freely, and would turn his anger away from them." (c. iv.-xiv.)

"The style of Hosea," Bishop Lowth remarks, "exhibits the appearance of very remote antiquity: it is pointed, energetic, and concise. It bears a distinguished mark of poetical composition, in that pristine brevity and condensation which is observable in the sentences, and which later writers have in some measure neglected. This peculiarity has not escaped the observation of Jerome, who remarks that this prophet is altogether laconic and sententious. ('Præf.' in XII. 'Proph.')

But this very circumstance, which anciently was supposed to impart uncommon force and elegance, in the present state of Hebrew literature is productive of so much obscurity, that although the general subject of this writer is sufficiently obvious, he is the most difficult and perplexed of all the prophets." ('Prælect.' xxi.) Compare also Bishop Horsey's remarks on the style of Hosea, in the preface to his translation of this prophet. (p. xxix-xliv.)

The canonical authority of the prophecies of Hosea has never been disputed. They are frequently quoted in the New Testament; compare Hos. vi. 6, with Matt. ix. 13, xii. 7; Hos. x. 8, with Luke xxiii. 30; Hos. xi. 1, with Matt. ii. 15; Hos. i. 10, ii. 23, with Rom. ix. 25, 26, and 1 Peter ii. 10; Hos. xiv. 2, with Hebr. xiii. 15.

(The *Introductions* of Eichhorn, Jahn, De Wette, Augusti, and Horn; Pococke, *Commentary on the Prophecy of Hosea*, Oxf., 1695; Kuinoel, *Hosæ Oracula, Hebraice et Latine*, Leip., 1792; Horsey, *Hosæ*, translated from the Hebrew, with notes explanatory and critical, London, 1801, 1804; Stuck, *Hosæ Prophetæ*, Leip., 1828, a useful work.)

HOSHEA, or HOSEA, King of Israel, was the son of Elah, and apparently not of the regal line. His predecessor was Pekah, who, after having ravaged Judah, then governed by Ahas, with the assistance of Rezin, king of Syria, had seen his own kingdom in return ravaged by Tiglath-Pileser, the protector of Ahas, who removed many of the inhabitants to Media and Assyria. In the confusion of this period Pekah was slain by Hoshea, who, after six years of anarchy, ascended the throne in B.C. 728. Scripture records that "he did that which was evil in the sight of the Lord, but not as the kings of Israel that were before him." He permitted the announcement of Hezekiah that he had purified the temple to be made throughout his kingdom, and his subjects were allowed to attend the worship of the true God at Jerusalem. Shortly after his accession Israel was invaded by the Assyrians under Salmanser, the successor of Tiglath-Pileser; Hoshea was unable to make any effectual resistance, and consented to become tributary. The yoke was however heavy, and he sought to throw it off by the assistance of So, king of Egypt. So, or Sabako, is the Sabakoph, whose name is found on Egyptian monuments, and was an Ethiopian who reigned in Egypt. Salmanser then again invaded Israel, besieged Samaria, and after a siege of three years took it, when, in the ninth year of his reign, Hoshea and the ten tribes were carried away into Assyria, and placed "in Halab and in Habor by the river of Gozan, and in the cities of the Medes," from which time they have been lost, and there is no statement of the fate of Hoshea; but at Arban, on the Khabour (the Kebar of Ezekiel), which falls into the Euphrates near Carhemish, Mr. Layard found Assyrian sculptures recording the conquest, and Jewish communities existed around its neighbourhood as late as the 12th century.

* HOSKING, WILLIAM, architect and civil engineer, was born at Buckfastleigh, Devon, in 1800, his father being at the time in partnership with an elder brother as serge-manufacturers and paper-makers. These manufactures proving unprofitable, in 1808 Mr. Hosking's father succeeded in obtaining an appointment in the public service in the

then convict colony of New South Wales, to which he at once proceeded with his wife and infant family. The means of education in New South Wales were, at that early period, very restricted, and of very low quality; and when the subject of this notice came to be fourteen or fifteen years of age, his father proposed to send him home to England for his better education. This he resisted, and preferred to be apprenticed to a surveyor and general builder, who had then recently arrived as an emigrant settler, and had established himself in business at Sydney. The business of the surveyor was of the most general nature, and his apprentice acquired a practical knowledge of almost all the mechanic arts applied in the rougher as well as the smoother operations of the constructor. Mr. Hosking's preliminary professional education was thus of the kind to which Telford in his autobiography tells the young engineer he must "descend" if he would excel, and which probably gave him that relish for truth in construction which he is known to possess. The family returned to England in 1819, and in 1820 the subject of the present notice was articled for three years to the late Mr. Jenkins of Red Lion-square, London, in whose office he acquired a knowledge of London surveying practice. Having qualified himself by previous studies in the higher branches of his profession, he spent a year in Italy and Sicily previous to establishing himself in London as an architect, in 1825. After this he contributed various articles to the 'New Monthly Magazine,' then edited by Thomas Campbell. In 1829 he delivered a course of Lectures on Architecture at the Western Literary and Scientific Institution; which being reported in the 'Athenæum,' led to his engagement to write the article 'Architecture' in the seventh edition of the 'Encyclopædia Britannica;' an elaborate treatise which was followed by another on 'Building;' and which have been issued in a separate volume. In 1834-5 Mr. Hosking became engineer of what is now known as the West London railway, for which he designed and executed the curious work, near Kensal Green, by which the Paddington Canal is passed over the railway, and a public carriage-road over the canal and railway together. The works and buildings of the Abney-Park Cemetery were designed by him. In 1840 he was appointed Professor at King's College, London, of 'The Arts of Construction in connexion with Civil Engineering and Architecture,' and in 1842 was added the Professorship of the 'Principles and Practice of Architecture.' His introductory lectures to these courses have been published. He has also written on the 'Composition and Construction of Bridges' to accompany Mr. Weale's folio volumes of 'Examples of Bridges.' In 1843, Mr. Hosking having given evidence before the Commissioners for inquiring into the state of large towns, his views attracted the notice of Lord Lincoln, then Chief Commissioner of Woods and Forests, and upon the passing of the Building Act in 1844, Mr. Hosking was appointed one of the Official Referees under that act, being the senior according to the date of appointment. In 1855 this Act was superseded by the Metropolitan Building Act, and Mr. Hosking and his colleagues retired upon two-thirds of their salary, under legislative arrangements. During his occupancy of the office of Official Referee, Mr. Hosking published a 'Guide to the proper regulation of Buildings in Towns.' In 1852 he undertook the gratuitous service of a Metropolitan Commissioner of Sewers, in addition to his other duties. His labours in his office under the Building Act were unremitting, and they were greatly increased by the conflicting and deficient powers of the Act itself, which neutralised the best exertions. Mr. Hosking's latest architectural work is the stack of buildings on the south side of Cannon-street, of which the establishment of Messrs. Berens, Blomberg and Co. forms the principal feature, and which possesses some peculiarities of construction, especially in the modes employed of draining, warming, and ventilating the several compartments into which the stack is divided for separate occupation. In June 1850 was published in 'The Builder,' a 'Plan showing Professor Hosking's Design for extending the accommodation of the British Museum,' which had been submitted to the Trustees. This plan contemplated the erection of buildings, in addition to the Museum, over the uncovered quadrangular court inclosed by the existing buildings. That plan has now been acted upon; and though the present arrangements differ from those of Mr. Hosking, his principle has been adopted.

HOTMAN, FRANÇOIS, called also by his Latinised name HOTMANUS, was born at Paris in 1524, of a family originally from Silesia. He studied law in the university of Orleans, and afterwards practised at the bar. About 1547 he embraced the Reformed religion, in consequence, it was said, of seeing the constancy with which Anne du Bourg, a counsellor to the parliament of Paris, supported the ignominious death to which he was condemned on account of his religion. [HÔPITAL, DE L'] His father having, in consequence of his change of religion, refused him his support, Hotman repaired to Switzerland, where he taught humanities in the College of Lausanne. In 1550 he was appointed professor of law at Strasbourg. He afterwards returned to France under the protection of the king of Navarre, and became professor of law first at Valence, and then at Bourges, from which last place he ran away after having concealed himself during the massacre of St. Bartholomew, and repaired to Geneva, and then to Basel, where he died in 1590. A collection of his works, in three volumes folio, was published at Geneva in 1599. His principal works are—1, 'Commentarius de Verbis Juris, Antiquitatum Romanarum Elementis amplificatus;'

2, *Commentarius in Quatuor Institutionum Juris Civilis Libros*; 3, *Commentatio Tripartita ad Libros Feudorum*; 4, *De Jure Regni Gallia Libri III.*; 5, *Disputationum Juris Civilis Volumen unum*; 6, *Antiquitatum Romanorum Libri Tres*; 7, *Commentarius in Orationes M. T. Ciceronis, eas maxime quæ aliquam Juris Questionem continent*; 8, *Commentarius in Epistolam Ciceronis ad Quintum Fratrem de Provincia bene administranda*; 9, *Consolatio e Sacris Literis*; 10, *Ad Remundum Rufum Defensorem Romanorum Pontificum contra Carolum Molinæum de Statu Primitivæ Ecclesiæ liber*; 11, *Franco Gallia*, in which he contended that France was an elective and not an hereditary kingdom; 12, *De Furoribus Gallicis et de Cæde Admiralis*; 13, *L'Anti-Tribonien, ou Discours sur l'Étude des Lois*, which he wrote at the request of the chancellor De l'Hôpital. A biography of Hotman is prefixed to the collection of his Latin Epistles, 4to, Amsterdam, 1700.

HOTTINGER, JOHN HENRY, born at Zürich in 1620, after studying in his native country repaired to Leyden in 1639, where Golius the Orientalist engaged him as his assistant. Hottinger learned the Arabic and Turkish languages under a native of Morocco, and gradually became a distinguished Oriental scholar. He made his Oriental studies subservient to his principal object, that of illustrating the Hebrew text of the Bible. He was appointed Professor of Scriptural Theology at Zürich, and in 1655 the Elector Palatine induced him to remove to Heidelberg, to fill the chair of Oriental Languages. He was afterwards made rector of that university, which flourished greatly under his administration. Being recalled to Zürich in 1661, he was employed by the government of his country in several important affairs. In 1667 the University of Leyden offered him the chair of theology, which he accepted; but while on the point of repairing to his destination he was drowned by the upsetting of a boat in the river Limmat. Hottinger left numerous works, chiefly on Oriental learning, the principal of which are—1, *Historia Orientalis*, which contains dissertations on the religion of the Sabæi, Nabathæi, and other ancient Arabic tribes; on the genealogy and history of Mohammed; on the various names of Saracens, Agareni, Ishmaelites, &c., given to his followers; on the condition of the Eastern Christians and Jews at the time of Mohammed; on the causes which have tended to maintain and to spread Mohammedanism; on the schisms and heresies among the Mussulmans, &c.; 2, *Etymologicum Orientale*, being a Lexicon of seven languages, Hebrew, Chaldaic, Syriac, Samaritan, Arabic, Ethiopic, and Thalmudico-Rabbinic; 3, *Promptuarium, sive Bibliotheca Orientalis*, being a catalogue of works in those languages. Hottinger had begun a work on the history of Mohammedanism on a large scale, which he styled *Theatrum Mohammedicum*, of which however he only published a 'Compendium,' to which he added a *Topographia Ecclesiastica Orientalis*, and also a *Compendium Theologiæ Christianæ Ecclesiarum Orientalium*. He also wrote *Historia Ecclesiastica Novi Testamenti*, 9 vols 8vo, 1667. His son John James Hottinger, professor of theology at Zürich, wrote an *Ecclesiastical History of Switzerland*.

HOUBIGANT, CHARLES FRANCIS, a priest of the Oratory, and an eminent Biblical scholar, was born at Paris in 1686. He was distinguished in early life by his great attainments, and lectured successively on the belles-lettres at Juilly, on rhetoric at Marseille, and on philosophy at Soissons. He afterwards removed to Paris, where his devotion to study and the duties of his profession produced a serious illness, which terminated in total deafness. Being thus incapacitated for public duty, he devoted all his time to study, directing his principal attention to the Hebrew language, in which he followed the system of Maclaf, who was a strenuous opponent of vowel points. In 1732 Houbigant published his *Racines Hébraïques*; and in 1746, his *Prolegomena* to a new edition of the Hebrew Bible, in which he attempted to show that numerous errors had been introduced into the text. His great work, entitled *Biblia Hebraica cum Notis Criticis et Versione Latina ad Notas Criticas facta*, appeared at Paris in 1753, in 4 vols. fol.; each page is printed in two parallel columns, one of which contains the Hebrew text of Van der Hooght without points, and the other the Latin translation. In the margin of the Pentateuch the various readings of the Samaritan Pentateuch are given. The notes and emendations of the text are printed at the end of each volume. The critical notes and prolegomena were reprinted at Frankfurt, 2 vols. 4to, 1777; and the Latin version, which is usually considered very elegant and correct, at Paris, 5 vols. 8vo, 1753. Houbigant learned the English language late in life, and translated into French Sherlock's *Sermons*, Lealey's *Short Method against the Deists*, and Forbes's *Thoughts on Natural Religion*. Houbigant died on the 31st of October 1783, in the ninety-seventh year of his age. An account of Houbigant's life, together with a list of his works, is given by Adry in the *Magasin Encyclopédique*, May, 1806.

HOUBRAKEN, the name of two distinguished Dutch artists, father and son—

ARNOLD HOUBRAKEN, the father, was born of a good family at Dort, in 1660, and was the pupil of Samuel van Hoogstraten. He painted history and portrait, and executed many designs for booksellers. He lived chiefly at Amsterdam; but he visited this country and remained here eight or nine months, for the purpose of making drawings of some portraits by Vandyck, which were engraved by Van Gunst. Houbraken is however chiefly known for his account of the lives of

Dutch painters, with portraits engraved by his son, in continuation of Van Mander—*Groote Schouburg der Nederlandsche Konstschielders en Schilderssen*, in three parts. The first and second parts were published at Amsterdam in 1718 and 1719, for the author; the third part was published in 1721 for his widow: Houbraken died in 1719.

JACOB HOUBRAKEN, his son, was an admirable engraver; in execution he has never been surpassed, and perhaps seldom equalled. He was born at Dort in 1698, and accompanied his father when very young to Amsterdam. The excellent etched portraits of painters in his father's *Groote Schouburg* are among his earliest works, yet they are certainly of their class some of the finest etchings in existence. The most beautiful specimens however of Houbraken's engravings are some of *The Heads of Illustrious Persons of Great Britain*, published in London by the Knaptons in 1748: the excellence of some of these heads must be seen to be comprehended. Some of the heads however which were engraved by Houbraken, though of the highest excellence as works of art, want authenticity as portraits, as, for instance, those of Carr, Earl of Somerset, and Secretary Thurloe, which Walpole says are spurious. The collection is notwithstanding of great historical interest. Houbraken engraved also a great number of portraits of distinguished Dutch characters. He died in 1780.

(Van Gool, *Nieuwe Schouburg der Nederlandsche Kunstschielders, &c.*; Watelet, *Dictionnaire des Arts, &c.*; Huber, *Manuel des Amateurs, &c.*)

HOVEDEN, ROGER DE, an English historian, who seems to have been the same person whom Robert of Gloucester calls 'Hew of Howdane,' and who is supposed to have received his name from Hoveden, or Howden, in Yorkshire, the place of his birth. Walter of Coventry says he was in the household of Henry II.; probably as a chaplain, as that monarch is stated to have employed him in the service of visiting monasteries at the time when their abbots or priors died, and when the revenues of the respective foundations fell into the king's hands. The exact time of Hoveden's birth and death is unknown, but it was not till after the reign of Henry II. that he wrote his *History*, which commences in 731, where Bede ends, and continues to 1202, the third year of King John. Hoveden's *History* was published by Sir Henry Savile, in the *Scriptores post Bedam*, folio, London, 1595, at Frankfurt in 1601, and in Bohn's *Antiquarian Library*. Nicolson, upon the authority of Pitts, says that in 1291 Edward I. caused diligent search to be made in all the libraries in England for Hoveden's *History*, to adjust the dispute about the homage due from the crown of Scotland. Leland, Selden, Sir Henry Savile, and Nicolson, all bear testimony to the fidelity of Hoveden as an historian.

HOWARD, CHARLES, LORD HOWARD OF EFFINGHAM, second of that title, grandson of Thomas, second duke of Norfolk, was born in 1536. After seeing much service by land and sea, he was appointed in 1585 Lord High Admiral of England, and in that capacity had the chief management of the preparations made in defence of England against the Spanish Armada in 1588. He acquitted himself of this most weighty charge with signal prudence as well as bravery. In 1596 he was joined with Essex in the expedition against Cadiz, having command of the fleet, while Essex had command of the troops. A natural jealousy existed between the old soldier and the young favourite; nor did they quite agree as to the measures to be pursued. However the town was taken, and the ships in the harbour destroyed. [ESSEX, EARL OF.] For this service Lord Howard was created Earl of Nottingham, as declared in his patent, much to the annoyance of Essex, who would willingly have engrossed the glory himself, and sought to prejudice the queen against his late colleague. In 1599, in the anticipation of another Spanish invasion, coupled with suspicion of the Earl of Essex's intentions in Ireland, the queen reposed in the Earl of Nottingham the sole command of the army and navy, with the title of Lieutenant-General of England, which he held during six weeks—an extraordinary mark of confidence. He commanded the troops which put down Essex's rash attempt at rebellion, and treated him in his downfall, as he had during his prosperity, with respect and kindness. Under the reign of James I. he retained his high consideration at court, and was employed in several distinguished capacities. He died on December 14th, 1624, at the advanced age of eighty-seven, some years before which he had resigned the office of Lord High Admiral in behalf of the favourite Villiers, then earl of Buckingham, receiving in exchange a pension of 1000*l.* and the acquittal of a debt of 1800*l.* due to the crown. During half a century he possessed the favour, and for great part of that time the highest confidence of his sovereigns, without earning or retaining it by unworthy compliances or selfish and interested intrigues. His temper appears to have been no less upright, honourable, and generous, than his services were distinguished.

HOWARD, HENRY, EARL OF SURREY. [SURREY, EARL OF.]

HOWARD, HENRY, R.A., professor of painting in the Royal Academy, was born on the 31st of January 1769. He was a pupil of Philip Reinagle, R.A., and was admitted a student at the Royal Academy in March 1788. As a student his success was very decided; and it was his fortune, for the first time in the history of the institution, to receive on the same occasion, December 10th 1790, two of the highest premiums—the first silver medal for the best drawing from the life, and the gold medal for the best historical painting; and he at the same time received the special commendations of the president,

Sir Joshua Reynolds, for the excellence of his historical design. In the following year he visited Italy, and at Rome he and Flaxman pursued their studies in conjunction.

On his return to England Mr. Howard was employed to make drawings for the Dilettanti Society, and designs for book-plates; he also painted some portraits. His first contributions to the Royal Academy, 'Æneas and Anchises' and the 'Planets drawing Light from the Sun' (1796), were much admired by persons of classic tastes; and from this time for more than half a century Mr. Howard continued, without a single intermission, to send to each annual exhibition some paintings almost invariably of the classes of which these may be taken as the types. In fact the enormous number of pictures which he executed, though illustrating themes from the Scriptures, and from Greek, Roman, Italian, and English history, poetry and mythology, have all or nearly all the same character, for which perhaps there is no word so descriptive as that of 'academic.' His figures are almost always well drawn; of elegant proportions; have the established 'classic' contour and expression, or absence of expression; are clothed, or partly clothed, in the same conventional 'drapery' which nymphs and goddesses, whatever their position, wear so easily and gracefully in pictures and statues, despite the ordinary laws of gravity, which however may fairly be regarded as not applying to such beings; and they are so arranged as to afford a pleasing flow of line and an agreeable conformity to the rules of pictorial composition; while the colouring, if not rich and glowing, is chaste and harmonious. They were in fact good 'academic' pictures, and they are no more. Always strictly attentive to the proprieties, there is nothing in any one of his works, whether it be a 'Venus rising from the Sea,' a 'Love animating the Statue of Pysmalion,' or a cold 'Primeval Hope,' that can by any chance give the slightest shock to the nerves of the most susceptible—who is not shocked by any representation of undraped female beauty. But if his "bovies of fair forms" are never like those of Etty trembling on the verge of the voluptuous, they never like them are buoyant with the exuberance of life and youthful vigour—never exhibit the free abandon of riant enjoyment and unrestrained spontaneous action. They are works to be looked at with a certain quiet admiration of the artist's skill, not to seize the attention and linger in the memory. In a word, they are works of taste, not of genius.

Mr. Howard was elected an associate of the Royal Academy in 1801; in 1808 he became an academican; and in 1811 he was appointed secretary to the Academy, an office he held till his death, though for some years previously its active duties were performed by an assistant. He died on the 5th of October 1847.

The titles of a few of his pictures will sufficiently indicate the range and character of his subjects. Of his scriptural paintings, the most ambitious are 'Christ Blessing Little Children,' placed as an altarpiece in the chapel in Little Berwick Street; 'the Angel appearing to St. Peter in Prison;' and 'Aaron staying the Plague.' The great bulk of his pictures as already mentioned are however those in which the subjects were chosen with a view to afford the opportunity of painting the nude female form; and to this class his best pictures belong. The most admired of these is his 'Birth of Venus,' painted in 1828. Others are 'The Marriage of Cupid and Psyche,' 'Proserpine,' and like stock subjects; but a large number consists of figures floating in the air with such titles as the 'Pleiades,' the 'Solar System,' the 'Circling Hours,' 'Morning,' 'Night,' &c. Beside numerous pictures from Spenser, his favourite poet, Milton, Shakspeare (especially the 'Midsummer Night's Dream') &c., he painted many as 'Fairies on the Sea-shore,' with merely fancy titles; and he also painted many portraits. It deserves to be mentioned as illustrative of his life-long devotion to his art, that not only did he continue to paint pictures for the Academy exhibitions up to the year of his death, but that on the occasion of the first cartoon competition in 1843, he did not shrink from entering the lists, though then seventy-three years of age, and in the rude encounter with the young artists fresh from the schools, his cartoon, 'Man beset by contending Passions,' carried off one of the premiums of 100*l*.

In 1814 Mr. Howard won the prize for a medal for the Patriotic Society, and thenceforward he was generally employed in preparing the designs for the medals and great seals required by the government. He also made numerous designs for works to be executed in silver, chiefly for the house of Rundell and Bridge. Frank Howard, the son of Mr. Howard, is well known as an able designer, and the author of several elementary works on art. To a brief memoir of his father, contributed by him to the 'Athenæum' for November 13, 1847, we are indebted for most of the facts in this notice.

HOWARD, JOHN, one of the most disinterested, laborious, and useful philanthropists that have done honour to any age or nation, was born about 1726. His father was a London tradesman, who apprenticed him to a wholesale grocer, but dying when his son was about nineteen years of age, and leaving him in possession of a handsome fortune, young Howard, who was in weak health, succeeded in purchasing the time remaining of his indentures, and determined on making a tour in France and Italy. On his return, still in ill health, he took lodgings in Stoke Newington, where his landlady—a widow named Loidore—having nursed him carefully through a severe illness, he out of gratitude married her, though she was twenty-seven years his senior. She however died about three years after the

marriage; and he now conceived a desire to visit Lisbon, a chief inducement being his wish to do something to alleviate the miseries caused by the great earthquake in 1756. He embarked accordingly, but was captured by a French privateer, and carried a prisoner into the port of Brest, and subsequently removed into the interior, but after a while was permitted to return to England on the promise that if he could not induce the government to make a suitable exchange for him he would return to his captivity. The exchange was obtained however, and Howard retired to a small estate he possessed at Cardington, near Bedford; and there, in April 1758, he married a second wife, Miss Henrietta Leeds. The lady appears to have been in every way a suitable match for him; but it is mentioned as a characteristic trait, that he stipulated before marriage "that in all matters in which there should be a difference of opinion between them his voice should rule." For seven years they lived in unbroken happiness, leading a quiet domestic life: he chiefly engaged in improving his grounds, rebuilding his house, cultivating his farm, and with even more earnestness setting himself to the task of raising the physical and moral condition of the peasantry of Cardington and its neighbourhood, by erecting on his own estate better cottages, establishing schools, and visiting and relieving the sick and the destitute; and she in all ways assisting him in his benevolent exertions. But at the end of that time, after giving birth to a son, she died, March 1765, and Howard, who was devotedly attached to her, from that time lost his interest in his home and its occupations. Till it appeared advisable to send his son to a distance for his education, Howard lived at Cardington in seclusion; then, unable to bear the solitude of the place with all its painful associations, he made another continental tour. In 1773 he was nominated sheriff of Bedford. The sufferings which he had endured and witnessed during his own brief confinement as a prisoner of war struck deep into his mind. The impression was now renewed and intensified when, as sheriff, he had charge of the prisons of the county. Shocked by the misery and abuses which prevailed, he attempted to induce the magistrates to remedy the more obvious of them. The reply was a demand for a precedent, and Howard at once set out on a tour of inspection to other county prisons in the hope to find it. But he soon began to suspect that the evil was general, and now set himself diligently to work to inquire into the extent and precise nature of the mischief, and if possible to discover the true remedy for the evil. In that year he visited, in two journeys, most of the town and county jails of England, and accumulated a large mass of information, which, in March 1774, he laid before the House of Commons. This was the commencement of prison reform in England; for in the same session two acts were passed, one for relieving acquitted prisoners from payment of fees, the other for preserving the health of prisoners. Once actively engaged, he became more and more devoted to this benevolent pursuit; inasmuch that the history of his remaining years is little more than the diary of his journeys, the only exception being in fact his becoming a candidate with his friend Mr. Whitbread for the representation of Bedford in parliament. They were however defeated; and though a parliamentary scrutiny placed Mr. Whitbread at the head of the poll, his friend—fortunately for the cause of humanity—was only placed third on the list. Howard travelled repeatedly over the United Kingdom, and at different periods to almost every part of Europe, visiting the most noisome places, relieving personally the wants of the most wretched objects, and noting all that seemed to him important either for warning or example. The first fruit of these labours was a 4to volume entitled 'The State of the Prisons in England and Wales, with some preliminary observations, and an account of some Foreign Prisons,' 1777. "As soon as it appeared, the world was astonished at the mass of valuable materials accumulated by a private unaided individual, through a course of prodigious labour, and at the constant hazard of life, in consequence of the infectious diseases prevalent in the scenes of his inquiries. The cool good sense and moderation of his narrative, contrasted with that enthusiastic ardour which must have impelled him to his undertaking, were not less admired; and he was immediately regarded as one of the extraordinary characters of the age, and as the leader in all plans of meliorating the condition of that wretched part of the community for whom he interested himself." (Aikin.)

The House of Commons having seconded his views by the introduction of a bill for the establishment of houses of correction, Mr. Howard, in 1778, undertook a fresh tour, principally to revisit the celebrated Rasp-houses of Holland; but he continued his route through Belgium and Germany into Italy, whence he returned through Switzerland and France in 1779. In the same year he made another survey of Great Britain and Ireland. In these tours he extended his views to the investigation of hospitals. The results were published in 1780, in an 'Appendix to the State of the Prisons in England and Wales,' &c. In 1781, having now travelled over all the south of Europe, except Spain and Portugal, through which he went in 1783, he visited Denmark, Sweden, Russia, and Poland; and continuing at intervals his home inquiries, published in 1784 a second appendix, together with a new edition of the original work, in which the additional matter was comprised.

The importance, both in prisons and hospitals, of preventing the occurrence or spread of infectious diseases, produced in Mr. Howard a desire to witness the working and success of the Lazaretto system

in the south of Europe, more especially as a safeguard against the plague. Danger or disgust never turned him from his path; but on this occasion he went without even a servant, not thinking it right, for convenience sake, to expose another person to such a risk. Quitting England in 1785, he travelled through the south of France and Italy to Malta, Zante, and Constantinople; whence he returned to Smyrna, while the plague was raging, for the purpose of sailing from an infected port to Venice, where he might undergo the utmost rigour of the quarantine system. He returned to England in 1787, resumed his home tours, and in 1789 published the result of his late inquiries in another important volume, entitled 'An Account of the principal Lazarettos in Europe, &c., with additional Remarks on the Present State of the Prisons in Great Britain and Ireland.' The same summer he renewed his course of foreign travels, meaning to go into Turkey and the east through Russia. He had however proceeded no farther than the Crimea when a rapid illness, which he himself believed to be an infectious fever, caught in prescribing for a lady, put an end to his life on the 20th of January 1790. He was buried at Dauphny, near Cherson, and the utmost respect was paid to his memory by the Russian government. The intelligence of his death caused a profound feeling of regret in his native country, and men of all classes and parties vied in paying their tribute of reverence to his memory. A marble statue by Bacon of 'the philanthropist' was erected in St. Paul's Cathedral by a public subscription.

Mr. Howard's piety was deep and fervent, and his moral character most pure and simple. His education had been neglected, so that his literary acquirements were small; neither were his talents brilliant. But he was fearless, single-minded, untiring, and did great things by devoting his whole energies to one good object. The influence of disinterestedness and integrity is remarkably displayed in the ready access granted to him even by the most absolute and most suspicious governments, in the respect invariably paid to his person, and the weight attached to his opinion and authority. He was strictly economical in his personal expenses, abstemious in his habits, and capable of going through great fatigue; both his fortune and his constitution were freely spent in the cause to which his life was devoted. The only blemish which has ever been suggested as resting upon his memory is in connection with his conduct to his son. Mr. Howard was a strict, and has not escaped the charge of being a severe parent. The son, unhappily, in youth fell into dissolute habits, which being carefully concealed from the father, and consequently unchecked, brought on a disease which terminated in insanity. He survived his father nine years, dying on the 24th of April 1799; but he remained till his death a hopeless lunatic. The question of Howard's alleged harshness to his son has been thoroughly investigated and effectually disproved. (See Dixon's 'Life of Howard.') That his devotion to the great philanthropic object to which he gave up his life may not have interfered with his paternal duties it is of course impossible to affirm; but that John Howard was an affectionate and kind-hearted father, as well as a single-minded benefactor to his species, there can now be no reasonable doubt.

(*Lives of John Howard*, by Atkin and Dixon.)

HOWE, REV. JOHN, a distinguished nonconformist, was born on the 17th of May 1630, at Loughborough, in Leicestershire, where his father was the incumbent of the parish church, but having become a nonconformist, he was ejected from his living, and retired to Ireland. He did not remain long there, but returned to England, and settled in the town of Lancaster, where John Howe received his rudimentary instruction from his father. He was afterwards educated at Christ's College, Cambridge, where he took the degree of B.A. From Cambridge he removed to Brasenose College, Oxford, of which he became the bible-clerk in 1648, and where he again took his degree of B.A., January 18, 1649. He was made a demy of Magdalen College by the parliamentary visitors, and was afterwards chosen a fellow. On the 9th of July 1652 he took the degree of M.A. After having been ordained by a nonconformist divine, assisted by others, he became a minister at Great Torrington, in Devonshire. In 1654 he married, and soon afterwards Cromwell appointed him his domestic chaplain. He gave some offence to the Protector by one of his sermons, in which he censured certain opinions about divine impulses and special impressions in answer to prayer, but retained his situation till Cromwell's death, and afterwards till the deposition of Richard Cromwell. He then resumed and continued his ministry at Great Torrington till the Act of Uniformity, August 1662, obliged him to restrict his preaching to private houses. He went to Ireland in 1671, where he resided as chaplain to the family of Lord Massarene till in 1675 he accepted an invitation to become the minister of a congregation in London. In August 1685 he went to the continent with Lord Wharton, and in 1686 became one of the preachers to the English church at Utrecht. When James II. published the 'declaration for liberty of conscience' he returned to London, where he died April 2nd, 1705. John Howe was not only ranks as one of the most eminent of the Puritan divines, but was a man of great general learning, a good classical and Hebrew scholar, acquainted with the modern languages, and of superior manners and accomplishments. His 'Works' were published in 1724, 2 vols. folio, with a Life by Dr. Calamy the younger. They have since been republished, 'The Whole Works of the Rev. John Howe, M.A.,' 7 vols. 8vo, London, 1810-16, with an eighth vol.,

containing a Memoir and additional works, and again 'The Works of the Rev. John Howe, M.A., as published during his life, comprising the whole of the Two Folio Volumes, ed. 1724, with a Life of the Author, by the Rev. J. P. Hewlett,' 3 vols. 8vo, London, 1848. The more important of his works are the following: 'The Living Temple, or a designed Improvement of that Notion that a good Man is the Temple of God,' in 2 parts. 'A Treatise on Delighting in God,' in 2 parts. 'The Blessedness of the Righteous opened, and further recommended from the Consideration of the Vanity of this Mortal Life,' in Two Treatises. 'The Principles of the Oracles of God,' in a Series of Lectures. 'Life of John Howe, M.A., with an Analysis of his Writings, by Henry Rogers,' 12mo, London, 1836.

HOWE, RICHARD, EARL, the second son of Emanuel Scrope Howe, governor of Barbadoes, and Mary Sophia Charlotte, daughter of Baron Kielmanssegge, master of the horse to George I. when elector of Hanover, was born in 1725. At the age of fourteen he left Eton, and joined the Severn, one of the squadron which, under the command of Commodore Anson, was sent to make war upon the western coasts of Spanish America. On his return he received an appointment in the Burford, one of the fleet destined to the West Indies; where his behaviour in an action was such as to hasten his promotion, and he was made lieutenant of the Comet in 1745. His name is first publicly mentioned in the account of the siege of Fort William, when he was in command of the Baltimore. Shortly after he joined the Greyhound frigate (Captain Noel), and, with her assistance, engaged two French ships at Loch Nouy, but did not succeed in capturing them: Commander Howe was wounded in the head. On his arrival in England he was raised to the rank of Captain, and at the request of Rear-Admiral Knowles, was sent to join his squadron on the Jamaica station, where he arrived too late for the action off the Havana, 2nd of October 1748; the Cornwall, which had severely suffered in the action, was sent home under his orders. In 1751 Captain Howe obtained a commission for the Glory, of 44 guns, destined for Africa, and on his return from thence, was successively appointed to the Mary yacht and the Dolphin frigate, in which he acquired much valuable knowledge of the navigation on the Barbary shores. In 1755 the command of the Dunkirk, 60 guns, was given to him, and he sailed with Admiral Boscawen. The fleet took up a position off Cape Race, Newfoundland, in order to intercept the French fleet. The fogs enabled the main body of the enemy to escape; but two ships, the *Liys* and the *Aloide*, struck to Captain Howe. Thus commenced the Seven Years' War.

In 1756 Howe was employed in the Channel service; during the following year he commanded the *Magnanime*, under Sir Edward Hawke, but the expedition proved unsuccessful, except in taking a fort on the island of Aix. On the 1st of June 1758 he hoisted his flag in the *Essex*, as commodore of the fleet destined to blockade Brest. Contrary winds forced them to put back, a month after their departure from St. Helen's; but sailing a second time, with the Duke of York on board the *Essex*, he reached Cherbourg, and instantly reduced it: after this he landed the troops in St. Lunaire bay to attack St. Malo, an object which they abandoned in order to engage with the French at Martignon, where many English were killed while endeavouring to embark. On this occasion Howe distinguished himself by his coolness and intrepidity. In 1758 he married Mary, daughter of Chiverton Hartop of Welby; and soon after, losing his brother Viscount Howe, he succeeded to his title and estate. In 1759 Lord Howe was re-appointed to the *Magnanime*, and on the 20th of June engaged with the squadron under M. de Conflans, in which Howe took the *Thésée* and the *Formidable*. His reputation was now so high that George II. complimented him by saying that "his life had been one continued series of services to his country."

After he had been again afloat in the *Princess Amelia*, he returned home; and peace being proclaimed, Howe occupied a seat at the Board of Admiralty for two years, and then filled the important office of Treasurer of the Navy, and was returned to parliament for Dartmouth. Except in questions that regarded naval administration, he took little part in the business of the house. In October 1770, he was promoted to be Rear-Admiral of the Blue, and commander-in-chief in the Mediterranean. In 1776 he sailed on board the *Eagle* for North America. He was successful in a brilliant action with D'Estaing's squadron off Rhode Island, which he quitted September 1778, and on the 30th of October landed at St. Helen's. On a change of ministers, his friends, who came into power, appointed him Admiral of the Blue, and to the command of the *Victory*; but failing in his attempt to intercept the West Indian traders, he soon returned to Spithead. He was then sent to relieve Gibraltar, which he accomplished, and arrived in England on the 14th of November. Lord Keppel having resigned his office, Lord Howe succeeded him as First Lord of the Admiralty. He quelled, in his own person, a mutiny on board the *Janus*. In three months he was obliged to resign, on another change of ministry, which restored Lord Keppel. At this time he was created Earl Howe, in acknowledgment of his services, with remainder of the barony of Langar to his eldest daughter. On the 22nd of June 1790 he was appointed to the command of the Channel fleet, with the additional and peculiar distinction of being ordered by his majesty to hoist the union at the main, on board the *Queen Charlotte* of 100 guns; but after cruising about in a fruitless

search for the Spanish fleet, he anchored at Spithead, 14th September, and enjoyed repose on shore for a considerable time. In 1794 he again advanced with the several convoys to the Lizard, and the same day discovered three frigates outside of Brest harbour. On the 25th of May two French corvettes were taken; and on the 28th of May several French vessels were seen far to the south-east, and the *Bellerophon* engaged with the *Révolutionnaire*. The enemy's motions having been watched during the night, the two fleets continued in the same relative position on the morning of the 29th: on the 30th and 31st the state of the weather prevented an engagement, but on the 1st of June the action commenced at 9 A.M. The *Marlborough*, *Defence*, *Queen Charlotte*, &c., broke the enemy's line: ten of the enemy's ships were dismantled, seven were taken, three only rejoined the French admiral, and Howe had the glory of towing into Portsmouth six ships of the line.

Lord Howe's health now began to fail; but notwithstanding his infirmities, he consented to go in person to quell the mutinies that had arisen at Portsmouth, Spithead, &c.; he ascertained the causes of complaint, and endeavoured to remove them by causing the obnoxious officers to be superseded: his concessions were judicious, but they did not escape censure.

This was the last public act of his life. With his wife and daughter he spent the rest of his life in retirement at his house at Porter's Lodge, in the enjoyment of a fortune of about 1800*l.* a year. He had declined a pension, which was offered him after the action of the 1st of June. On the death of Dr. Warren, and in the absence of his other medical adviser, Dr. Pitcairn, at Lisbon, he tried electricity as a remedy for his complaint; the disease, which was the gout, was by these means driven to his head, and after sinking rapidly, he expired on the 5th of August, 1799. He was buried in the family vault in Nottinghamshire, and a monument by Flaxman was erected to his memory at the public expense. In person Lord Howe was tall and well proportioned; his features strongly marked and dark—their expression generally harsh. His mind was strong, and his judgment usually correct. His reserve gave rise to the saying, that "Howe never made a friendship but at the mouth of a cannon." Bravery, patient endurance under adverse events, and coolness in danger, were his chief characteristics. He was the first sea-officer of his time. (*Barrow, Life of Howe.*)

HOWELL, JAMES, the son of a clergyman in Wales, was born near Brecknock, about the year 1596. He was educated at Jesus College, Oxford, where in 1613 he took his bachelor's degree, but then left the university. His father's family was numerous, and he had to shift for himself. Several men of rank having set up a patent glass-manufactory in London, Howell was appointed to be their steward or manager; and in 1619 he undertook for his employers a tour on the Continent, in the course of which he visited Holland, Flanders, France, Spain, and Italy. Returning home in 1621, he was elected a Fellow of Jesus College. He next travelled as tutor to a young gentleman; after which he was sent to Madrid to negotiate the restoration of a confiscated merchant vessel. His skill and activity in business had now made him well known. In 1626, after having been treated with for a diplomatic appointment, he became secretary to Lord Scrope, the president of the North, and was next year chosen to sit in parliament for the borough of Richmond. In 1632 he went to Denmark as secretary to an extraordinary embassy; and on his return he continued to be for some time unemployed, visiting Ireland to seek service under Strafford, but being disappointed by that nobleman's fall. In 1640 his diversified services were rewarded by an appointment to the clerkship of the Council at Whitehall; but the breaking out of the civil war soon made his place dangerous, and in no long time deprived him of it. In 1643 he was committed to the Fleet, where he was detained till after the king's death. He was penniless, and even in debt; but, with his characteristic versatility and spirit, he set about writing for the press, by which he contrived to maintain himself, both during his imprisonment and afterwards under the Protectorate. A little flattery which he had found it convenient to administer to Cromwell was forgiven at the Restoration, when the place of historiographer-royal was created as a means of providing for him. He retained this office till his death, which happened in November 1666. He was buried in the Temple church.

Howell's writings are very numerous. A few of them are in verse, the principal being his '*Dodona's Grove*, or the *Vocal Forest*,' 1640, which he himself translated into French. But his prose works alone deserve remembrance; and of these there are not a few which either were pamphlets of temporary interest or translations of historical pieces from the French and Italian, and were forgotten even in his own time. Howell's name is preserved by the good sense, sagacity, and liveliness of his letters, which were the earliest collection of the kind published in our country. They were whimsically called '*Epistolæ Ho-Elizianæ*': familiar Letters, domestic and foreign, partly historical, partly political, and partly philosophical.' The first volume appeared in 1645, the fourth and last in 1655, and they have since gone through many editions.

* HOWITT, WILLIAM AND MARY, are names associated in English literary history, and therefore to be treated together.

William Howitt was born in 1795 at Heanor in Derbyshire, of a family long settled in that county as proprietors of land. His father

on his marriage had joined the Society of Friends, to which his wife belonged, and his children were brought up in the principles of that religious body. William Howitt was one of six brothers. He was educated at various schools in the connection of the Society of Friends, supplementing the knowledge there obtained however by studies of his own ranging over a wider field, and including natural science, modern languages, and English literature generally. In his boyhood and youth he was also particularly fond of open-air sports, such as shooting and fishing; and thus he acquired much of that intimate knowledge of English rural nature and life which he has exhibited in his writings. He was already a writer of poems when his marriage in 1823, at the age of twenty-eight, with a lady of similar tastes, who had also become known in the circle of her friends as a poetess, helped to determine him to a life of authorship. The lady who then became Mrs. Howitt was Miss Mary Botham of Uttoxeter, of a family whose attachment to the principles of Quakerism reached back to the old times, when those who held those principles were proscribed and persecuted. Like her future husband, Miss Botham had by her own efforts in self-education, as supplementary to the instruction provided for her at home and at school, enlarged the range of her knowledge and her accomplishments far beyond what was then common in her circumstances. At the time of their marriage she and her husband were precisely in the same position—both were writers, and writers too of similar tastes and faculties; but neither of them had published. From the year 1823 commences the literary career of both. In that year appeared the '*Forest-Minstral and other Poems*,' which bore their joint names on its title-page. They were then residing in Staffordshire, where however they remained but for a year, removing afterwards to other places of residence in the midland counties, including Nottingham, and only occasionally paying visits to London. During these three or four years their literary productions consisted almost exclusively of poetical and other contributions to annuals and periodicals. A selection of these contributions, with new additional poems, was published in 1827, under the title of '*The Desolation of Eyam, the Emigrant, and other Poems*.' During the next ten years their pens were occupied separately in works chiefly in prose, Mr. Howitt publishing successively his '*Book of the Seasons*' (1831), his '*Popular History of Priestcraft*' (1833), and his '*Tales of the Pantika, or Traditions of the most Ancient Times*,' and Mrs. Howitt at the same time publishing two works of fiction, namely, a collection of dramatic stories called '*The Seven Temptations*,' and a novel of English country life called '*Wood-Leighton*.' Mr. Howitt's '*History of Priestcraft*,' written as it was in a spirit of very pronounced political liberalism, led to his election as one of the aldermen of Nottingham, and to other connections with the active politics of the time. In 1837 he and Mrs. Howitt, with their family, removed to Esher in Surrey, in order to be nearer to London, and more out of politics; and here Mr. Howitt wrote in succession his '*Rural Life of England*' (1838); his '*Colonisation and Christianity*,' giving an account of the treatment of aborigines by European colonists (1838); his '*Boy's Country Book*' (1839); and the first series of his '*Visits to Remarkable Places—Old Halls, Battle-Fields, &c.*' (1840). Mrs. Howitt at the same time wrote some of her well-known tales for children, which form in themselves a series too long to be individually enumerated.

In 1840 the Howitts removed to Heidelberg for the education of their children; and their residence of two years at this place, varied as it was by tours through several parts of Germany, gave a new direction to the literary plans of both. Thus in 1842 Mr. Howitt, besides a second series of his '*Visits to Remarkable Places*,' published his work on the '*Rural and Domestic Life of Germany*,' which was followed in 1844 by his '*German Experiences addressed to the English*.' It was during the same residence in Germany that Mrs. Howitt, while continuing to write stories of her own for the young, was attracted, through a German translation of one of Miss Bremer's Swedish novels, to the rich field of Scandinavian literature generally. Perceiving what a freshness there was in this literature, she set herself to acquire the Swedish and Danish languages; and the results have been her well-known series of translations of Miss Bremer's novels from the one tongue, and of tales of Hans C. Andersen and other writers from the other. These translations were produced at intervals between 1844 and 1852; during which period also Mrs. Howitt, besides continuing her juvenile tales and contributions to periodicals, published her original fiction called '*The Heir of Wast-Waylan*' (1847), a new edition of her '*Ballads and other Poems*' (1847), and her '*Sketches of Natural History in Verse*' (1851). She also edited for three years the '*Drawing-Room Scrap-Book*,' writing for it among other things biographical sketches of the queens of England; she edited the '*Pictorial Calendar of the Seasons*,' published in Bohn's '*Illustrated Library*' in 1850; she translated '*Ennemose's History of Magic*' for Bohn's '*Scientific Library*' (1847); and she wrote, along with her husband, '*Stories of English and Foreign Life*' in Bohn's '*Illustrated Library*' (1850).

Meanwhile Mr. Howitt had been equally indefatigable. In 1843 he translated the story of Peter Schlemihl; in 1846 he published a work of a political character entitled '*The Aristocracy of England*,' in 1847 he published, in two volumes, his '*Haunts and Homes of the most Eminent British Poets*,' in 1848 '*The Hall and the Hamlet*,' or, *Scenes and Characters of Country Life*,' in 1850 '*The Year-Book of the*

Country,' and in 1851 a three-volume novel called 'Madam Dorrington of the Dens.' During a portion of this period he was connected, rather injuriously for his fortune, with the 'People's Journal,' a weekly periodical of literature and social topics. The journal was started in April 1846, and Mr. Howitt became first a contributor and eventually part-proprietor of it. Differences with the editor and co-partner led Mr. Howitt to withdraw, and to set up a rival periodical called 'Howitt's Journal,' of which three volumes were published. Neither periodical proved permanently successful. In June 1852 Mr. Howitt, in a spirit of blended adventure and historical and literary curiosity, set out, with two of his sons, and in company with other friends, for Australia. He remained there for upwards of two years, visiting Melbourne (where he had a brother settled as a physician), Sydney, and several of the 'diggings,' and undergoing many hardships in his practical experience as a digger, and in his journeys through the wilds. He formed very decided opinions as to the vices of the government system of management in the colony, particularly the system of refusing to let out land in moderate quantities. To this he traced many evils attending emigration to Australia as compared with emigration to America. While in Australia Mr. Howitt wrote 'A Boy's Adventures in the Wilds of Australia' (1854); and since his return to England in December 1854, he has given to the world, in a more elaborate form, the results of his observations of the colony, in a work in two volumes, entitled 'Land, Labour, and Gold; or, Two Years in Victoria, with Visits to Sydney and Van Diemen's Land,' 1855. During her husband's absence, Mrs. Howitt continued her 'Library for the Young' and her contributions to periodicals; and in the important work on 'The Literature and Romance of Northern Europe,' published in 1852 in the joint names of herself and her husband, perhaps the most considerable portion is hers.

It was also during Mr. Howitt's absence in Australia that his daughter, MISS ANNE MARY HOWITT, who had by that time, in the course of her education as an artist, given proofs of the possession of an inherited talent likely to display itself in the department of art, proved the same talent likewise in literature by publishing her work entitled 'The Art-Student in Munich' (1853). Miss Howitt has subsequently exhibited one or two paintings, which have attracted much notice.

HUCHTENBURG, JOHAN VAN, a celebrated Dutch battle-painter, was born at Haarlem in 1646. He studied with Vandermeulen at Paris, and etched some of his designs. In 1708 or 1709 he was commissioned by Prince Eugene to paint the series of battles which he and the Duke of Marlborough had gained together. Huchtenburg himself made etchings of these battles in copper: they were published at the Hague in 1725. His pictures are much in the style of Wouwerman, and are scarcely inferior to the works of that master. He lived chiefly at the Hague, but died at Amsterdam in 1738. (Van Gool, *Nieuwe Schouburg*, &c.)

HUDSON, HENRY, is eminent among those early navigators who sought a shorter passage to China than the circuitous route round the Cape of Good Hope. Nothing is known of him before 1607, when he was employed by some London merchants to command a ship fitted out to prosecute that object. In that year he advanced along the eastern coasts of Greenland beyond the 80th degree of latitude before he was stopped by the ice. In 1608 he kept more to the east, and in a lower latitude; but he was unable to get to the eastward of Nova Zembla. In 1609 he tried again the north-eastern route; and being again unsuccessful, bore away for America, along the coast of which he ran down as far as Chesapeake Bay, whence he returned to England. Not yet discouraged, and still finding persons willing to adventure their money in the lottery of maritime discovery, he undertook a fourth voyage, in hopes of discovering a north-western passage, in April 1610. In the course of June and July he sailed through the Strait, and discovered the Bay, both of which have since been called after his name, and hoped for a time that the much coveted object was attained; but finding that great inland sea to be but a bay, he resolved to winter in the southern part of it, hoping to pursue his discoveries in the spring. The insufficiency of provisions however exposed him and his companions to great hardship, and at last proved fatal to his scheme. The men became discontented and insubordinate; Hudson on the other hand seems to have lost his temper; and at last, while they were in the Strait on the voyage home, some of the boldest of the mutineers seized the captain and eight of his staunchest followers, and sent them adrift in an open boat, and they were never afterwards heard of. It may give a juster notion of the hardship of these old sailors, to know that in his first voyage his crew consisted of ten men and a boy; his last and largest ship's complement was only twenty-three men. For an account of his adventures, see Purchas's 'Pilgrims,' and Harris's 'Voyages.' He has a full article in the 'Biog. Britann.'

HUDSON, JOHN, D.D., was born at Wedehop in Cumberland, about the year 1662. He entered the University of Oxford in 1676, took the degree of M.A. in 1684, and was soon afterwards elected a Fellow of University College, of which he was tutor for many years. In 1701 he was appointed principal librarian of the Bodleian Library; and in 1712, principal of St. Mary's Hall. He died on the 27th of November 1719.

Hudson published editions, with critical notes, of several of the

classical authors, namely, Velleius Paterculus, 1693, 1711; Thucydides, 1696; 'Geographia Veteris Scriptores Græci Minores,' with notes and dissertations by Dodwell, 4 vols. 8vo, 1698-1712; Dionysius of Halicarnassus, 2 vols. fol., 1704; Longinus, 1710, 1718; 'Mæris Atticista,' 1712; Æsop's 'Fables,' 1718; Josephus, 2 vols. fol., 1720, which was printed as far as the fourth index under the author's own superintendence; the last few pages were edited by his friend Hall, who has prefixed to the work a short account of the life and writings of Hudson.

HUDSON, THOMAS, was born in Devonshire in 1701. He came to London and became the pupil of Richardson the painter, and married his daughter. After the death of Gervas and Richardson, Hudson was the most successful portrait-painter in London, and, notwithstanding the rivalry of Vanloo and Liotard, he enjoyed the chief business in portrait-painting until the return of his pupil Reynolds from Italy, when, though he professed not to admire his pupil's innovation in portraiture, he gave up business and retired to his villa at Twickenham. Northcote describes an interview between Hudson and Reynolds in 1752, soon after the return of the latter from Italy, though he does not vouch for the fact: Hudson called on Reynolds to see a much-talked-of head of a boy with a Turkish head-dress—it was the portrait of the Italian boy Marchi, whom Reynolds had brought with him from Italy; "perceiving," says Northcote, "no trace of his own manner left, Hudson exclaimed, 'By God, Reynolds, you don't paint so well as when you left England!'" Hudson himself had also just returned from Italy: he visited Rome, together with Roubiliac. He entered Italy as Reynolds was leaving it, and the rising and setting stars of portraiture in England met on Mount Cenis in their passage over the Alps.

There is little to be said in commendation of Hudson's style: he was of the Kneller school; he made fair transcripts of his models, with little variety of posture, and not much more of costume. His masterpiece is the family piece of Charles duke of Marlborough, now in the hall at Blenheim. Many of his works were engraved in mezzotint by the younger John Faber. A portrait of Handel by Hudson in the Picture Gallery at Oxford is said to be the only portrait that the great composer ever sat for. There is a portrait by Hudson of Archbishop Potter in the same collection. Hudson was rich and contented. He had at his villa at Twickenham a good collection of cabinet pictures and drawings by great masters; many of the latter were purchased at the sale of Richardson's excellent collection. He survived Richardson's daughter, and married Mrs. Fiennes, a lady of fortune, and to her he bequeathed his villa. He died in January 1779.

HUERTA, VICENTE GARCIA, DE LA, was born in 1729, at Zafrá in Estremadura. Actuated both by national and academic pride, he became, through his numerous poetical effusions, the successful leader of that reaction which in the middle of the last century took place in Spain against the exotic Gallic school, which had been imported with its new dynasty, and was headed by his able adversary Lusan. The reputation of his fine tragedy, 'La Raquel,' which is a far superior composition to the short poem of the preceding century, with the same title, by Ulloa Pereyra, soon extended even to Italy, into which language it was translated, and where it was performed in 1780 at the theatre Zannoni of Bologna. It has however undergone the severest criticism of Bouterwek and others, who in other respects highly commend the author. Huerta died at Madrid in 1797. Besides another inferior tragedy, partly taken from the 'Electra' of Sophocles, 'Agamemnon vengado,' he published 'Vocabulario Militar Español,' which portrays the great Spanish captains; 'Obras Poéticas,' 2 vols. 8vo; and a classical selection out of the amazing store of Spanish dramas, which he entitled 'Theatro Heespañol,' 16 vols. 8vo.

Huerta must not be confounded with his brother Pedro, the laborious author of the 'Comentarios de la Pintura Encástica del Pincel,' and of 'De las Líneas de Apoles y Protogenes;' nor with another academician, Francisco Manuel de Huerta, one of the three editors of the 'Diario de los Literatos de España;' nor with Lopez de la Huerta, who wrote the 'Examen de la Posibilidad de Fijar los Sinónimos de la Lengua Castellana.'

HUET, PETER DANIEL, Bishop of Avranches, was born at Caen on the 8th of February 1630. He was originally intended for the profession of the law; but he is said to have been induced to devote his attention to subjects of general literature by the perusal of the 'Principles' of Des Cartes, and Bochart's 'Sacred Geography.' In 1652 he accompanied Bochart to Sweden, and was solicited by the queen to settle in her dominions. This offer however he refused, and returned to France, where he acquired so great a reputation that he was appointed in 1670 sub-tutor to the Dauphin. During the next twenty years he was principally engaged in superintending the publication of the edition of the classics which is usually known by the name of 'In usum Delphini.' The first idea of this edition was started by the Duc de Montausier; but we are indebted to Huet for the plan and arrangement of the work. In 1674 he was elected a member of the French academy; and having taken orders in 1676, at the age of forty-six years, he was appointed to the abbey of Aunay near Caen, where he composed the greater part of his works. In 1685 he was made Bishop of Avranches, but was not consecrated till 1692, in consequence of some disputes between the pope and the French govern-

ment. He resigned his bishopric in 1699, in order to enjoy more time for study; and he obtained in exchange the abbey of Fontenay near the gates of Caen. During the latter years of his life he lived principally at Paris in the Maison Professe of the Jesuits. He died on the 26th of January 1721, at the age of ninety-one.

The best known of Huet's works is his 'Demonstratio Evangelica,' which was published originally at Paris in 1679, and has since been frequently reprinted. This book, like most of Huet's other works, is written with more learning than judgment. The most important of Huet's other works are:—'De Interpretatione libri duo,' Paris, 1661; 'Origenis Commentarii in Sacram Scripturam,' Rouen, 1668, 2 vols. fol., reprinted at Cologne, 1695, 3 vols. fol.; 'Censura Philosophiæ Cartesianæ,' Paris, 1689, 1694, 12mo; 'Quæstiones Alnetanæ de Concordia Rationis et Fidei,' Caen, 1690; 'De la Situation du Paradis Terrestre,' Paris, 1691, 12mo; 'Huetii Commentarius de Rebus ad eum pertinentibus,' Amst., 1718, 12mo, of which the title-page contains a curious instance of bad Latin; 'Traité Philosophique de la Faiblesse de l'Esprit Humain,' published after the author's death, by his friend the Abbé d'Olivet, Amst., 1723, 8vo.

HUGHES, JOHN, the son of a respectable citizen of London, was born in 1677, at Marlborough, in Wiltshire. He was educated in London, chiefly at a dissenting academy, where Isaac Watts was one of his fellow-pupils. His natural turn for study was encouraged by the delicacy of his health, which made his friends well pleased to obtain for him a small income in the public service. He held a clerkship in the Ordnance-office, and was secretary to several commissions issued under the great seal for improving harbours. In 1717, too late to permit him to enjoy affluence long, he was appointed by Earl Cowper to be clerk to the commissions of the peace. At the age of nineteen he had written a tragedy called 'Almasont, Queen of the Goths,' which however was never played or published. Several occasional poems and translations, the earliest of which, in 1697, celebrated the peace of Ryswick, introduced him to the acquaintance of Addison, Pope, and other literary men, whose liking he was well qualified to secure by his good temper and want of pretension. When Addison's critical friends, on reading the first four acts of 'Cato,' had condemned it, Hughes dissented, and insisted on its being completed; and although the author afterwards completed it himself, yet Hughes was in the first instance intrusted with that task. Hughes wrote a tragedy called 'The Siege of Damascus,' which is inserted in several modern collections, and merits its place for the excellence it possesses in language and in lofty and refined feeling. It was acted for the first time on February 17th, 1720, and received much applause. The author that night lay on his death-bed; and he expired before morning. Hughes was skilled also in music, and was frequently employed to write poetical pieces for musical accompaniment. Among his productions of this kind were English operas on the Italian model. But his best claim to remembrance rests on his having been one of the most frequent assistants of Addison and Steele in their periodical essays. He wrote some papers for the 'Tatler' and 'Guardian;' and to the 'Spectator' he contributed eleven numbers and a good many letters, being more than the quantity furnished by any other of the minor writers, except Tickell and Budgell. He edited respectably the works of Edmund Spenser, and translated Molière's 'Misanthrope,' and Fontenelle's 'Dialogues of the Dead.' The 'Letters of John Hughes, Esq.,' were published in 3 vols. 1773, with a preface containing some notice of Mr. Hughes by the editor, William Duncombe, Esq.

HUGO, VICTOR-MARIE, VICOMTE, an eminent French lyrical poet, dramatist, and romance writer, was born at Besançon, Feb. 26, 1802. He was the son of General Hugo, who assisted Augereau in dissolving the legislative body on the 18th fructidor, and whose long defence of Thionville, in 1814, was at the time highly spoken of. The general was the author of several military works; he died on the 30th of January 1828. The early education of the future poet was acquired at home, but that home was very unsettled, the military career of his father having removed the family to the island of Elba, to several of the Italian states, then to Madrid, and back to Paris, before the child was eight years old. In 1818 he went to the college Cordier, to be prepared for the Ecole Polytechnique; in this college he remained five or six years, and completed his education.

In 1817, whilst pursuing his studies at the college Cordier, he sent a poem to the Concours of the French Academy, on the 'Advantages of Study,' which obtained an honourable mention. The same year he wrote his tragedy of 'Irtamène;' it was modelled on the old classic school, and composed in verse. At this period Victor Hugo was a legitimist, and in all his writings warmly advocated the cause of royalty. Three successive prizes carried off at the competitions of the Academy des Jeux Floraux, won for him the title of Master in that institution. In 1822 he established with his two elder brothers the 'Conservateur Littéraire,' to which Victor Hugo contributed a large number of poems, besides his romance of Bug-Jargal. In 1823 he produced another romance, 'Han d'Islande,' in three volumes. His celebrated collection of poems, 'Odes et Ballades,' appeared the same year, and placed him at once in the front line among the living poets of France. All his early odes are replete with loyal and religious sentiments; the spirit of his mother, who was a Vendean, breathes in every one of them. The long drama of 'Cromwell,' 'Les Orientales,' another fine collection of poems; a sombre romance called

'Le Dernier Jour d'un Condamné,' and the drama of 'Hernani,' appeared between 1825 and 1830.

The fall of Charles X., and the agitation which followed the Revolution of July, produced a sudden change in the opinions, in the style, and in the *morale* of this author's works. For several years previously, a body of ardent and impulsive young writers, had been struggling to reanimate the literature of their country, which the reign of Napoleon had enslaved and almost extinguished. This body divided itself into two parties, the Classics, or those who adhered to the rules of the old masters; and the Romantics, or those who advocated a greater freedom and latitude in the art. None but those who were living in France between the years 1828 and 1832, can appreciate the heat and vivacity of this contention. All the most illustrious names in French literature were quoted by the young spirits of the day only to be ridiculed. "Nobody," said the critic Moreau, in the 'Courier Français,' "is now respected if he is above eighteen years of age." The classics of course resisted this opinion; but they consisted chiefly of old or middle-aged men, and for many years were borne down by the new school as by a torrent.

At the head of this school, which adopted the name of *La Jeune France*, Victor Hugo placed himself immediately after the July revolution. He abandoned tragedy, and adopted melo-drama in its place; he set aside the true, the terrible, and the beautiful, and took up with the specious, the horrible, and the monstrous. He denaturalised history, and ransacked its exhaustless stores, not to discover and hold up to admiration the eternal types of wisdom, patriotism, and rectitude, but those of folly, meanness, and indulgence. In this spirit he wrote his 'Marion Delorme,' which appeared in 1831; 'Le Roi s'amuse,' 'Lucrece Borgia,' and 'Mario Tudor,' which were produced in 1832 and 1833; his 'Angelo,' 'Emeralda,' and 'Ruy Blas,' which appeared in 1835, 1837, and 1838. The last of his dramas was 'Les Burgraves,' represented for the first time March 7, 1843, at the Theatre Français.

Whilst these dramatic works were in progress, he brought out his best romance, 'Notre Dame de Paris,' in 1831, and in 1832, his beautiful poems, 'Les Feuilles d'Automne,' usually cited as his best work. His 'Chants du Crepuscule' was published in 1835, his 'Voix Intérieures,' in 1837, 'Les Rayons et les Ombres,' in 1840. His 'Letters on the Rhine,' well translated into English by Mr. Aird, were published in 1841; in which year Victor Hugo, at the age of thirty-nine, became a member of the French Academy. Louis Philippe created him a peer, April 16, 1845.

After the dethronement of the citizen king, in 1848, Victor Hugo was twice returned for the Assemblée Nationale, and mingled in the ranks of the extreme democrat. In December 1852 he was exiled from France. He then took up his abode in the island of Jersey, where he continued three years, occupied in writing violent philippics both in prose and verse against Napoleon III. His recent departure from Jersey, and transference to the adjacent island of Guernsey, were the subjects of much discussion in the papers during the month of January 1856.

HUMAIÛN, NESIR-EDDIN MOHAMMED, the son of Baber, and the second emperor of the Tartar, or as it is more usually called, the Mogul dynasty in Hindustan, was born at Cabul, A.H. 913 (A.D. 1503). He accompanied his father Baber in his invasion of Hindustan, A.H. 932 (A.D. 1525), and commanded the right wing of the army in the decisive battle of Panipat, in which the Afghan Sultan Ibrahim Lodi was entirely defeated. After this battle, Humaiûn was sent against two Afghan chiefs, who had assembled an army of 40,000 or 50,000 men east of the Ganges; and after having defeated them he rejoined the army of Baber, and was present at the battle fought with the native Hindoo princes at Biann near Agra, in which he greatly distinguished himself.

Humaiûn ascended the throne on the death of Baber, A.H. 987 (A.D. 1580). Humaiûn does not appear to have possessed that energy and decision which characterised his father; in consequence of which the native princes of Hindustan quickly renounced their allegiance to the Mogul dynasty. Humaiûn was however at first successful in reducing them to subjection; Bahadur, the powerful monarch of Gujerat, was conquered; and the Hindoo princes were defeated in Bengal. But while he was employed in reducing these provinces, Shir Khan, the Afghan governor of Bahar, revolted against him. A battle was fought between them on the banks of the Ganges A.H. 947 (A.D. 1540); in which Humaiûn was entirely defeated, and obliged to retreat to Lahore. Soon after this he was deserted by his brothers Kamrân and Hindal; and after wandering for a year in the neighbourhood of the Indus, exposed to many hardships and dangers, he at length took refuge in the territories of Tahmâsp Mirza, king of Persia; who received him most hospitably, and assisted him with troops to enable him to recover his dominions. In A.H. 952 (A.D. 1545) he again entered Cabul; and was engaged for several years in a contest with Kamrân, who, though repeatedly conquered and as often pardoned by Humaiûn, did not cease making war against his brother till he was deprived of his eyes. In A.H. 962 (A.D. 1554-5) Humaiûn marched against Sekunder, the Afghan emperor of Delhi; and after defeating his forces near the river Sutlej, and at Sirhind (28th of June 1555), he again obtained possession of that part of Hindustan, which had been conquered by Baber. Humaiûn died on the 11th of

the month Rubby al Avul, A.H. 983 (21st of January 1556), in his forty-eighth year, in consequence of a fall from the terrace of his palace. He was succeeded by his son Akbar.

Humáidn was distinguished by a greater love of justice and humanity than we usually meet with in Oriental sovereigns. He frequently pardoned his brothers who rebelled against him, and was with great difficulty persuaded to consent to the punishment of Kamrán. We are informed by Ferishta, that "he devoted himself to the sciences of astronomy and geography, and not only wrote dissertations on the nature of the elements, but had terrestrial and celestial globes constructed for his use." He also wrote several poems, which were extant in the time of Ferishta.

An interesting account of the life of Humáidn is given in the 'Tezkereh al Vakiát, or Private Memoirs of the Mogul Emperor Humáidn, written in the Persian language by Jouher, a confidential domestic of His Majesty;' of which an English translation was published by Major C. Stewart, London, 1832. See also Ferishta's 'History,' translated by Lieutenant-Colonel Briggs, vol. ii. pp. 70-97; 154-180.

HUMBERT, JOSEPH AMABLE, a French general, was born at Rouvray, near Remiremont, November 25, 1767. Deprived of both his parents in childhood, he was indebted for his imperfect education to an aunt, from whose house he ran away at sixteen. From this time he led a vagrant life for nearly nine years; at one time a servant to a tradesman at Nancy; then a common workman at Lyon, and for several years a hawk of rabbit-skins in his own neighbourhood. In this situation the Revolution found him, when he enlisted as a volunteer, in June 1792. Being one of the finest men in the French army, extremely brave, ready witted, and presumptuous, his natural gifts suited the times, so that he rose very rapidly, and within six months became a lieutenant, a captain, and a colonel. In April 1793 he was made a general of brigade; and during the invasion of Trèves, in August 1794, he gave proofs of reckless daring as a soldier. But his spirit of insubordination, at this period, drew upon him a severe rebuke from his commander, General Bournonville, in consequence of which he was removed to the army of the west, operating against the insurgents of La Vendée. Here he distinguished himself on several occasions under General Hoche, whose confidence he acquired; but having been employed to superintend the slaughter of the Royalist prisoners at Quiberon, whom he had induced to capitulate on the promise of honourable treatment, he bore for several years the stigma, which belonged rather to Tallien and the government. Nearly a thousand men were shot in this massacre, among whom were M. de Sombreuil, and several royalist officers of rank. In 1796 General Hoche, after great efforts to stimulate the Directory, was sent with an army of 9000 men to invade Ireland: he took with him General Humbert, who was made a general of division. But this expedition came to nothing, a violent storm having scattered the several ships of the squadron, and obliged Hoche to regain the French coast. At length, about the middle of August 1798, General Humbert was led to undertake a landing in Ireland, with a single division, consisting of 1500 troops. With this small force he landed at Killala, August 23, and took possession of the town. Three days after he marched from Killala to meet General Lake, who had with him a force superior in numbers, but consisting chiefly of yeomanry and militia. The forces encountered near Castlebar, and Lake was defeated. Humbert now took possession of Castlebar, which became his head-quarters. He and his lieutenant, Sarrazen, made the greatest efforts to induce the Irish to join his standard, in which he was assisted by one or two rebels of note belonging to the country. But the recent disastrous battle of Vinegar Hill (May 23, 1798); the weakness of his army, reduced to less than a thousand men; and his want of money even to pay his own troops, proved unfavourable to his views, and rendered his object abortive. In this forlorn condition he was met by the advanced guard of Lord Cornwallis and beaten; and soon after was obliged to capitulate, September 8, 1798. He was exchanged in March 1799, and returned to France.

In 1802 he was ordered to join the expedition of General Leclerc, destined against the blacks of St. Domingo, whom he repeatedly defeated. After the death of Leclerc he returned to France in the same ship with the widow of his leader, the beautiful Pauline, who is said to have promised him her hand when the term of her mourning had arrived. This presumption proved the ruin of Humbert; the indignant First Consul at once ordered him to leave Paris, and would have proceeded to harsher measures, had not the unfortunate general made his escape to America in 1804. He never afterwards appeared in his native country, but led for many years a new course of adventure among the Spanish settlements. Humbert died at New Orleans, February 27, 1823.

* HUMBOLDT, FRIEDRICH-HEINRICH-ALEXANDER, BARON VON, was born at Berlin September 14, 1769, two years after his brother, the celebrated philologist, Wilhelm. His father, Major Von Humboldt, had been in the service of Frederick the Great, and was a man of some distinction in Prussia, and possessed of considerable property: he died in 1779, but his widow survived till 1796. After having been carefully educated at home under tutors, Alexander von Humboldt went, in 1786, along with his elder brother, to the University of Frankfurt-on-the-Oder, where he studied natural science and political

economy, while his brother studied law. Already the two brothers had revealed the difference of their tastes—William devoting himself chiefly to philology, history, and art, while the passion of Alexander was for all studies referring to physical nature. In 1788 Alexander transferred himself to Göttingen, the university of which was then adorned by Blumenbach, Heyne, and Eichhorn. Here both brothers formed an intimate acquaintance with George Forster, Heyne's son-in-law, who had been the companion of Captain Cook in his voyage to the South seas. Forster's enthusiastic disposition made a strong impression on both the brothers, but especially on Alexander, whose eagerness for foreign travel, as well as the liberal and patriotic character of his political opinions, may be traced in part to this early friendship. In 1790 he made his first tour in Forster's company, visiting the Rhine countries, Holland, and England; and the result was his first work as a naturalist, entitled 'Mineralogische Betrachtungen über einige Basalte am Rhein' ('Mineralogical Considerations on certain Basaltic Formations on the Rhine'), Brunswick, 1790. As Humboldt had destined himself for official employment under the Prussian government, he went, on his return from this tour, to Hamburg, to learn book-keeping and the like at a commercial academy there; after which, as the particular employment for which he had devoted himself was one in connection with mining and metallurgical works, he betook himself, for special instruction in this department, to Freiberg, where Werner was then director of a mining academy (1791). In 1792 he was appointed to a post in the mining and smelting department of the Prussian public works, and was located at Bayreuth as mining superintendent. He remained in this situation till 1795, contributing during these years scientific articles on various subjects to German periodicals, besides writing and publishing by itself, in Latin, a botanical work of some importance, entitled 'Specimen of the Flora of Freiberg, exhibiting the Cryptogamic and especially the Subterranean Plants of the district; to which are added Aphorisms on the Chemical Physiology of Plants,' 4to, Berlin, 1793. In 1795 he resigned his mining appointment, having set his heart on travelling over some little-explored part of the globe as a naturalist. "I had from my earliest youth," he says, "felt a burning desire to travel in distant lands unexplored by Europeans." Owing to the state of the continent however, involved at that time in the general war consequent on the French revolution, it was not easy for the young naturalist to carry out his project. For a year or two he resided in various parts of Germany, more particularly at Jena, where he and his brother became intimately acquainted with Göthe and Schiller, and where high expectations were formed by these and other great Germans of the future career of a naturalist possessing so conspicuously as Alexander von Humboldt did, a keen spirit of generalisation, combined with a knowledge of all that had yet been done by his predecessors in every department of physical and physiological inquiry. His reputation in these respects was increased by two treatises published about this time—the one entitled 'Investigations on the Muscles and Nerve-Fibres, with Conjectures on the Chemical Process of Life in the Animal and Vegetable World,' Posen and Berlin, 1797; the other, 'On Subterranean kinds of Gas, and the Means of Lessening their Bad Effects,' Brunswick, 1799. At length, after whetting rather than abating his appetite for travel by a short tour in some parts of Italy, and finding it impossible to carry out a plan for visiting Egypt, Humboldt removed to Paris, in order to become acquainted with the distinguished savans then resident in that capital, and to make arrangements for accompanying, if even at his own expense, an expedition of exploration in the Southern hemisphere, then being fitted out under the auspices of the French government. This expedition was abandoned, but Humboldt had formed an acquaintance with a congenial spirit in Bonpland, who was to have been the naturalist of the expedition, and the two friends resolved to direct their joint energies towards some equivalent enterprise. They schemed a journey in Northern Africa; but that failing, they visited Spain, the government of which country gave their sanction to a plan of the two naturalists for an exploration of the Spanish dominions in South America. On the 4th of June 1799, Humboldt and Bonpland sailed from Corunna, escaped the English cruisers, and, after visiting Tenerife, where they ascended the Peak and collected some interesting observations on the natural history of the island, landed at Cumana, on the South American coast, on the 16th of July. The travellers were now in their element; and for five years they occupied themselves incessantly in travelling through tracts of the earth rich in all that could interest the scientific observer, and till then never scientifically described. Their journeyings during these five years form a story of personal adventure and scientific research, to which there are few parallels. They explored the regions of South America watered by the Orinoco and the upper part of the Rio Negro, fully tracing the connection between the Orinoco and the Amazon; they returned to the coast and sailed for Cuba, where they remained some months; leaving Cuba in March 1801, they returned to the South American continent, sailed up the Magdalena as far as they could—pursued their route by land to Popayan and Quito, and thence as far south as Lima, crossing the Cordilleras of the Andes no fewer than five times in the course of their journey, and, besides other mountain-ascents, climbing Chimborazo (June 23, 1802) to an elevation of 19,300 feet, being the highest point of the Andes ever reached by man; from Lima they sailed to Guayaquil, and thence to Acapulco on the western coast of Mexico

(January 1803); some months were spent in examining the city of Mexico and other parts of the country round, and in a visit to the United States; and in January 1804 the travellers set sail for Europe, taking Cuba again on their way. They travelled to Europe in August 1804, bringing with them, as the result of their five years' absence, an immense mass of new knowledge in geography, geology, climatology, meteorology, botany, zoology, and every other branch of natural science, as well as in ethnology, and political statistics.

The task of digesting and systematising this knowledge and presenting it to the scientific world still remained to be accomplished; and to this task Humboldt, taking up his residence in Paris, where Bonpland also resided, devoted almost exclusively the next twelve years of his life. Under the general title of 'Voyage de Humboldt et Bonpland dans l'intérieur de l'Amérique dans les années 1799-1804,' a succession of six or seven works of large dimension, with illustrative plates and atlases, was issued between 1807 and 1817, each work being devoted to observations in a particular department; and even those left the total mass of results unexhausted. The first part of the general work, published in 1807, was by Humboldt himself, and was on the geography and distribution of plants in the equinoctial regions; the second, by Humboldt and Bonpland jointly, was on the zoology and comparative anatomy of the expedition; the third, by Humboldt, was a political essay on the kingdom of New Spain, in two quarto volumes; the fourth, edited by Oltmanns, contained a digest of observations in astronomy and magnetism; and the fifth, forming a huge work by itself, was specially botanical, and was entitled 'Plantes Equinoxiales recueillies au Mexique, dans l'Isle de Cuba, dans les provinces des Caraïbes, de Cumana, et de Barcelone, aux Andes de la Nouvelle Grenade, de Quito, et de Perou, et sur les bords du Rio Negro, de l'Orénoque, et de la Rivière des Amazons.' All these instalments of the main work appeared originally in Paris; where also appeared in six volumes folio (1815-18), a separate work in Latin by C. S. Kunth, 'On the New Genera and Orders of Plants collected in their Exploration of the New World by Aimé Bonpland and A. de Humboldt, and by them described and partly sketched.' Works also appeared in Germany and England, giving in a more popular form the results of the great American exploration; the most notable of which in England were—'Researches concerning the Inhabitants of America, with descriptions and views of Scenes in the Cordilleras,' 2 vols. 1814; and 'Personal Narrative of Travels in the Equinoctial Regions of the New Continent during the years 1799-1804, by Alexander de Humboldt and Aimé Bonpland,' 5 vols. 1814-21—both translated and edited by Helen Maria Williams. It was not till about the year 1817 (if we except an 'Inquiry concerning Electrical Fishes,' published at Erfurt in 1806) that Humboldt had leisure for works not immediately growing out of his American travels. In that year he published a general essay entitled 'De Distributione geographica plantarum secundum coeli temperiem et altitudinem montium prolegomena.' In 1818 he revisited Italy with Gay Lussac, and afterwards spent some time in England; in 1823 he published 'A Geographical Essay on the Superposition of Rocks in both Hemispheres;' and in 1826 he took up his residence in his native Berlin—where he has for the most part lived since, honoured with every mark of esteem both by Frederick William III. and by the present sovereign, and more and more beloved by the Berliners as age added its venerable dignity to his face and mien. In 1829, when in his sixty-first year, he accepted a pressing invitation of the Russian Emperor Nicholas to accompany Messrs. Rose and Ehrenberg in their travels into the Asiatic regions of the Russian empire. In the company of these gentlemen he visited Siberia and the shores of the Caspian, and advanced as far east as the frontiers of the Chinese empire, returning by Moscow and St. Petersburg. Among various works, issued by him or under his superintendence, giving the scientific results of this expedition, may be mentioned 'Fragments de Géologie et de Climatologie Asiatiques,' 2 vols., Paris, 1831. Of Humboldt's subsequent works, the chief (omitting memoirs and essays scattered through scientific journals) are his 'Critical Examination of the History of the Geography of the New World, and of the progress of Astronomy in the 15th and 16th centuries,' 5 vols., Paris, 1836-39; and his famous 'Kosmos: a general survey of the physical phenomena of the Universe,' begun in 1845, and continued since. In this great work, of which there are several English translations, the naturalist passes into the sage, and communicates, as it were, the essence of all the accumulated knowledge of his life, in the form of a connected system of science pervaded by a philosophic meaning. The spirit of contemplation is here seen brooding, as it were, over the results of life-long acquisition, and imparting to them a poetic unity. Something of the same sublime tone of mind which is visible in this work is said to characterise the personal conversation of the man, as he moves about in the society of Berlin, a Nestor of eighty-seven, surrounded by men and women of two younger generations. With the present King of Prussia his intercourse is constant and familiar. His last visit to England was in 1842, when he came over to be present at the christening of the Prince of Wales. He will be remembered in future times as perhaps all in all the greatest descriptive naturalist of his age, the man whose observations have been most numerous and of the widest range, and the actual creator of several new branches of natural science.

HUMBOLDT, KARL WILHELM, BARON VON, one of the most

distinguished linguists of his time, was born at Potsdam, near Berlin, on the 22nd of June 1767, and after having received a careful education, together with his celebrated younger brother, the Baron Alexander von Humboldt, the subject of the preceding article, studied law in the universities of Göttingen and Jena. At Jena he formed an intimate and lasting friendship with the poet Schiller, who had great influence over him, and early turned his attention towards those studies in which he afterwards rose to great eminence,—philology, philosophy, and æsthetics. Humboldt wrote at an early age several essays and memoirs, and made translations from the Greek philosophers and poets, which appeared in different reviews in Germany; but though he was distinguished by his talents from most of his equals in age, he examined himself carefully before he entered upon any subject with a view to publish his ideas. He was thirty-three when he published his first great production, a critical essay on Goëthe's poem 'Hermann and Dorothea;' but this work at once established his fame, and is in its way a model of æsthetical criticism. After Humboldt had left Jena (1793) he carried on a correspondence with Schiller, which was published at Stuttgart in 1830, and which is one of the most remarkable collections of private letters that have ever been printed. They exchanged their ideas on various topics, especially on metaphysics, poetry, and history; the letters are extremely clear and well written, and those of Humboldt are quite as interesting as those of Schiller. It is pleasant to see that these two eminent men were just towards each other with regard to their respective accomplishments and deficiencies, as will be seen from Schiller's judgment of Humboldt in another part of this article. In 1802 Humboldt was appointed resident, and a few years afterwards minister plenipotentiary at the Holy See. After his return from Rome, in 1808, he was made chief of the departments of religion and public instruction in the home ministry, but tendered his resignation two years afterwards, and for some time retired to his seat at Tegel, near Berlin, where he devoted his time exclusively to literature, till, in 1812, he was sent as ambassador to Vienna. In this capacity he took part at the Conference of Prague in the summer of 1813, where, after long negotiations, Austria gave up her neutral position and espoused the cause of Prussia and Russia. During the campaigns of 1813 and 1814 he was in the head-quarters of the King of Prussia, Frederick William III.; assisted at the conferences of Châtillon; signed with Hardenberg the Treaty of Paris; and after the peace returned to Vienna, where he discharged the functions of minister plenipotentiary of Prussia, together with Hardenberg, at the Congress of Vienna. The treaty of 1815, through which the King of Saxony lost one-half of his kingdom, which was given to Prussia, was contrived and signed by Humboldt. He continued his diplomatic career at Frankfurt, where he made himself conspicuous through his conciliatory eloquence in the delicate business of dividing Germany among its princes, and afterwards as ambassador at the court of St. James, which he left during a short time in order to assist at the Congress of Aix-la-Chapelle. In 1819 he was appointed minister and a privy councillor at Berlin. The retrograde policy of the King of Prussia was supported by the state-canceller, Prince Hardenberg; but Humboldt and the ministers Von Beyme and Von Boyen tried to persuade the king to be faithful to those liberal principles which he had proclaimed in 1813, and especially advised him to keep the solemn promise he had given to introduce a general national representation. Unable to oppose a barrier to the king's policy, Humboldt, Beyme, and Boyen tendered their resignation, and Humboldt again retired to Tegel, where he henceforth devoted all his time to literature. He died on the 8th of April 1835.

During forty years he had enjoyed the well-deserved reputation of one of the greatest philosophers and linguists of Europe, and he was certainly an extraordinary man. The number of languages, most of them barbarous or half-civilised, which he had thoroughly studied, besides the classical languages, was very great. He acquired the most difficult languages, as, for instance, the Basque, in fewer months than others would have spent years in learning them. He was equally distinguished for the views he took in comparing the development of languages with the development of the human mind, as well as in comparative grammar; and as a critic of the ideal in poetry, philosophy, and the fine arts, he had few equals in Germany. Humboldt was mediocre as a poet, and it seems he felt his inferiority in this respect, for after having published a few poems, he stopped. He left a great number of poems in manuscript, chiefly sonnets, most of which were afterwards published by his brother Alexander; but though they are beautifully written and of a most elegant and delicate versification, they are vague and sentimental. Schiller, in a letter which was written when Humboldt first attempted authorship, speaks thus to his friend:—"I am convinced that the principal cause which seems to prevent your success as an author is the predominance of the reasoning faculties of your mind over the creating faculties, and consequently the preventive influence of criticism over invention, which always proves destructive to mental production. Your 'subject' becomes immediately an 'object' to you, although even in abstract sciences nothing can be created but by 'subjective' activity. In many concerns I cannot call you a genius; yet I must avow that you are a genius in others. For your mind is of so particular a description that you are sometimes exactly the contrary of all those

who are merely conspicuous through their reasoning faculties, through learning, or through abstract speculation. You will of course not attain perfection within the sphere of mental creation, but within the sphere of reasoning." Schiller's judgment was at once frank and correct: the spirit of universal criticism was embodied in Humboldt, who, with the exception of one large work which he left unfinished in manuscript, composed only minor works, most of them critical essays, which he published at different periods. The greater part of them was collected by his brother Alexander, and published under the title, 'Wilhelm von Humboldt's Gesammelte Werke,' Berlin, 1841, 4 vols. 8vo.

The principal productions contained in the first volume are—Two Memoirs on the 'Bhagavadgita,' a Sanscrit poem, the first of which was first printed in the 'Memoirs of the Royal Academy of Berlin,' and in Schlegel's 'Indische Bibliothek;' 'A Critique on F. A. Wolf's second edition of Homer's Odyssey,' previously printed in the 'Jenaische Literatur-Zeitung' (1795); 'Rom,' a poem, first published at Berlin, 1806; 'Die Sonne' (the Sun), a poem, first published at Berlin, 1820; Twenty-five Sonnets, not printed during the author's lifetime. Those of the second volume are—'Prüfung der Untersuchungen über die Urbewohner Hispaniens vermittelst der Vaskischen Sprache' ('Examination of the Researches on the Aborigines of Spain, by means of the Basque Language'), first published at Berlin, 1821, 4to. This is a celebrated work, and has become the type on which many similar investigations have been modelled. Humboldt purposely went to the Basque provinces in order to learn the Basque language, and he confounded for ever the absurd theories of Laramendi and many other Basque and Spanish scholars on the origin of the Basque language, which most of them endeavoured to establish as the primitive language of mankind, and consequently of paradise. Humboldt's opinion is that the present Basques are the only unmixed descendants of the ancient Iberians, and he shows that in remote times the Iberians inhabited the whole peninsula south of the Pyrenees, the southernmost part of France (Aquitania included), Liguria in Italy, and the islands of Sardinia, Corsica, part of Sicily, and the Balears. In the time of the Romans the central part of Spain was inhabited by Celtiberians, a mixture of Celts and Iberians: the limits assigned by Humboldt to this mixed race, that is, the extent of country where the ancient local names were not purely Iberian or Celtic, but mostly Celtic and Iberian compounds, correspond with those assigned to the Celtiberians by Cæsar, Strabo, and other ancient writers. In the countries inhabited by the Celtici (the southernmost part of Portugal) and the Tamarici (Galicia), the ancient names are so exclusively Celtic that the author concludes that both those nations were pure Celts. The Iberians, according to Humboldt, were of North African origin, and 'Berber' and 'Iber' are probably the same. The second volume also contains a 'Memoir on the Limits within which Governments ought to confine themselves in their care for the welfare of their Subjects;' A metrical German translation of the 1st-6th, the 12th and 14th of Pindar's Olympic Odes; the 1st, 2nd, and 4th-9th of the Pythian Odes, among which No. 4 appeared first, with a commentary, in the 'Neue Deutsche Monatschrift' (1795), and No. 9, with a commentary, in Schiller's 'Horen' (1797); the 4th, 6th, and 10th of the 'Nemean Odes;' Forty-one Sonnets printed from manuscript, &c. The contents of the third volume are:—A metrical German translation of the Agamemnon of Æschylus, first published, Leipzig, 1816, 4to, considered to be a masterpiece; A metrical German translation of the Choruses of the Eumenides; An Essay on the Drama in France, first printed in Göthe's 'Propylæen;' Travelling Sketches from Biscay; A most interesting Memoir on Comparative Linguistic, treated historically, and first printed in the 'Memoirs of the Royal Academy of Berlin;' Forty-two Sonnets from manuscript, &c. The fourth volume contains—the celebrated critical essay on Göthe's 'Hermann and Dorothea' (268 pages), which the author first published in the first volume of his 'Ästhetische Versuche,' Brunswick, 1799, 2 vols. 8vo; An Essay on the influence of different Sexes on Organic Nature; Fifty-seven Sonnets from manuscript, &c. Humboldt's 'Essay on the Dual' ('Ueber den Dualis'), Berlin, 1828, 4to, is not in this collection.

During the last ten years of his life Humboldt was actively engaged in investigating the Malay and American languages; but finding the task above his strength, he abandoned the American languages to his friend Dr. Buschmann, for whom he afterwards obtained the place of chief librarian of the Royal Library at Berlin, and he devoted his time exclusively to the Malay languages, on which he intended to write an extensive work. When he died, the first volume was nearly finished, and it was prepared for the press by Dr. Buschmann and Alexander von Humboldt, who published it, with a preface of his own, under the title, 'Ueber die Kawi Sprache auf der Insel Java,' Berlin, 1836, 8vo, which attracted the attention of all Europe. The greater portion of this work comprehends investigations of the progress of civilisation from the continent of India towards the large islands in the Indian Sea, which he traces in the monuments, the languages, and the literature of the different Malay nations; and only a small portion is devoted to the examination of the Kawi language. Humboldt bequeathed the store of valuable materials he had got together with so much labour, as well as a collection of rare manuscripts and books, chiefly on linguistic subjects, to the Royal Library at Berlin.

HUME, DAVID, was born at Edinburgh on the 26th of April 1711. His father's family was a branch of that of the Earl of Home, or Hume; but it was not a wealthy family, and Hume, being besides a younger brother, inherited but a slender patrimony. He was destined by his mother (his father had died when he was very young), for the profession of the law, but for this he showed no inclination, and it was eventually given up. The following is his own account of the matter:—"I passed through the ordinary course of education with success, and was seized very early with a passion for literature, which has been the ruling passion of my life, and the great source of my enjoyments. My studious disposition, my sobriety, and my industry gave my family a notion that the law was a proper profession for me; but I found an insurmountable aversion to everything but the pursuits of philosophy and general learning; and while they fancied I was poring upon Voet and Vinnius, Cicero and Virgil were the authors which I was secretly devouring."

We proceed with quotations from his autobiography:—"My very slender fortune however being unsuitable to this plan of life, and my health being a little broken by my ardent application, I was tempted, or rather forced, to make a very feeble trial for entering into a more active scene of life. In 1734 I went to Bristol, with some recommendations to eminent merchants, but in a few months found that scene totally unsuitable to me. I went over to France with a view of prosecuting my studies in a country retreat, and I then laid that plan of life which I have steadily and successfully pursued. I resolved to make a very rigid frugality supply my deficiency of fortune, to maintain unimpaired my independency, and to regard every object as contemptible except the improvement of my talents in literature." He first went to Rheims, and thence to La Flèche in Anjou; and at these two places, but chiefly at the latter, he composed his 'Treatise of Human Nature.' He returned to London in 1737, and published his 'Treatise' the year after. "Never," he observes, "was literary attempt more unfortunate than my 'Treatise of Human Nature.' It fell dead-born from the press, without reaching such distinction as even to excite a murmur among the zealots." But the disappointment did not affect him much or long; and going to Scotland to his brother's house, he there prosecuted his studies with vigour. In 1742 he published at Edinburgh the first part of his 'Essays,' which was on the whole favourably received, and the success of which consoled him in some measure for the failure of his first literary attempt.

In 1745 Hume went to live with the Marquis of Annandale, whose state of mind and health was such as to require a companion. He lived with him a twelvemonth, and received, it appears, a handsome salary. He had immediately after an invitation from General St. Clair to attend him as secretary to his expedition, which was at first intended against Canada, but ended in an incursion on the coast of France. Hume took the appointment, and the next year (1747) went as secretary to the same general in his military embassy to the courts of Vienna and Turin. "These two years were almost the only interruptions which my studies have received during the course of my life; I passed them agreeably and in good company; and my appointments, with my frugality, had made me reach a fortune, which I called independent, though most of my friends were inclined to smile when I said so; in short, I was now master of near a thousand pounds."

On his return to England he went again to his brother's house, and living there two years, composed his 'Political Discourses,' which formed the second part of his 'Essays,' and his 'Enquiry concerning the Principles of Morals.' These two works were published in 1752, the first in Edinburgh, and the second in London. Of the first he tells us that it was "well received abroad and at home;" but the other "came unnoticed and unobserved into the world." In the same year he was appointed librarian to the Faculty of Advocates, an office which was unattended with emolument, but which, as he tells us, gave him the command of a large library. He now formed the plan of writing the 'History of England.' "Being frightened," he says, "with the notion of continuing a narrative through a period of 1700 years, I commenced with the accession of the House of Stuart, an epoch when, I thought, the misrepresentations of faction began chiefly to take place." Priding himself much on his own impartiality, he was bitterly disappointed when, on the appearance of the first volume, he was accused on all hands of oneness. "I was assailed by one cry of reproach, disapprobation, and even detestation; English, Scotch, and Irish, Whig and Tory, churchman and sectary, freethinker and religionist, patriot, and courtier, united in their rage against the man who had presumed to shed a generous tear for the fate of Charles I. and the Earl of Strafford; and after the first ebullitions of their fury were over, what was still more mortifying, the book seemed to sink into oblivion. Mr. Millar told me that in a twelvemonth he sold only forty-five copies of it. . . . I was, I confess, discouraged; and had not the war been at that time breaking out between France and England, I had certainly retired to some provincial town of the former kingdom, have changed my name, and never more have returned to my native country. But as this scheme was not now practicable, and the subsequent volume was considerably advanced, I resolved to pick up courage and persevere."

In the interval between the appearance of the first and that of the second volume of his 'History,' he published his 'Natural History of Religion,' against which a violent pamphlet was written by Dr. Hurd.

The second volume of the 'History of England,' which embraced the period from the death of Charles I. to the Revolution, was published in 1756. "This performance," he says, "happened to give less displeasure to the Whigs, and was better received. It not only rose itself, but helped to buoy up its unfortunate brother." 'The History of the House of Tudor' was published in 1759; and the two volumes, containing the earlier English history, which completed the work, in 1761.

At this point in his autobiography, he remarks: "Notwithstanding the variety of winds and seasons to which my writings had been exposed, they had still been making such advances, that the copy-money given me by the booksellers much exceeded anything formerly known in England; I was become not only independent, but opulent. I retired to my native country of Scotland, determined never more to set my foot out of it; and retaining the satisfaction of never having preferred a request to one great man, or even making advances of friendship to any of them." His determination was not long adhered to. He received in 1763 an invitation from the Earl of Hertford to accompany him on his embassy to Paris, with a near prospect of being appointed secretary to the embassy, and, in the meanwhile, of performing the functions of that office. He at first declined the offer, but, on its being repeated, he availed himself of it. At Paris, as was to be expected, his literary fame brought him much attention; and he was greatly delighted with his residence there. When Lord Hertford was, in 1765, appointed Lord Lieutenant of Ireland, Hume remained at Paris as *chargé d'affaires* till the arrival of the Duke of Richmond. He returned to England in the beginning of 1766, and the year after was appointed Under-Secretary of State. He held this appointment about two years, and then returned to Edinburgh. "I returned to Edinburgh," he says, "in 1769, very opulent (for I possessed a revenue of 1000*l.* a year), healthy, and though somewhat stricken in years, with the prospect of enjoying long my ease, and of seeing the increase of my reputation."

In the spring of 1775 he was attacked by a disorder in his bowels, which at first caused him no alarm, but which ultimately carried him off. In the spring of 1776 he was recommended to go to Bath, to try the effect of the waters; and just before making the journey he wrote this autobiography from which we have quoted so largely. The waters were of no avail, and he shortly returned to Edinburgh, thoroughly resigned to his fate. He died on the 25th of August 1776, in his 66th year.

Together with Hume's autobiography was published, shortly after his decease, a letter from Dr. Adam Smith to Mr. Strachan, giving an account of his last days and of his death, and containing a lofty and glowing panegyric on his personal character.

As an author, Hume is to be viewed principally in two ways, as an historian and as a philosopher. The merits and the demerits of his history are generally very well known. It is written in a very easy and animated as well as thoughtful and philosophic style; but on the other hand it is disfigured by partiality, misrepresentation, and want of accuracy. He could not tolerate the labour of research into original documents, and he had not sufficient knowledge of the subject to indicate the steps by which the constitution has attained its present form, and the effect which successive enactments have had on the fundamental laws of property. As a philosopher, it has been observed that Hume is acute and ingenious, but not profound; and the remark is just, if applied to what he has done, rather than to what he perhaps might have accomplished. His treatises contain no complete system of any branch of philosophy; and the separate essays are chiefly valuable for acute observations and just deductions expressed in clear, concise, and appropriate words. Many of them will suggest further matter for reflection, though we think that few can be viewed as possessing the character of completeness. As a political writer, Hume cannot be ranked in the first class. To many of the literary essays of Hume we should assign a higher degree of merit than perhaps, at the present day, most people are disposed to give them. They appear to us to contain many most important truths expressed with great felicity; and if they seldom or never exhaust the subject, they perhaps always dispose the reader to further investigation. In his 'Enquiry concerning the Principles of Morals' he has made many ingenious elucidations of the principle of utility, as the fundamental principle of morals, but he has at the same time admitted a principle of conscience, independent of that principle of utility.

The editions of Hume's History are innumerable; and, as is well known, it now always goes along with that of Smollett, and to some recent editions is added a carefully written continuation, in which the narrative is carried on to the present time, from where Smollett left it, by the Rev. T. S. Hughes. The best edition of Hume's philosophical works is one published in Edinburgh, in 1826, in 4 vols. 8vo. A 'Life and Correspondence of David Hume,' by Mr. John Hill Burton, appeared in 1847, in 2 vols. 8vo.

HUME, JAMES DEACON, born 28th of April 1774, at Newington in the county of Surrey, was the son of Mr. James Hume, sometime secretary and afterwards a commissioner of the customs, and who was nephew of Dr. Hume, bishop of Salisbury. He was sent when very young to Westminster School, and in that establishment received during the head masterships of Dr. Smith and Dr. Vincent the whole of his school education. In 1790 Mr. Hume was appointed to a

clerkship in the Custom House, where he soon became conspicuous for that energy of character which accompanied him through life, so that at an unusually early age he was appointed to fill an office of much responsibility in the department. In 1798 Mr. Hume married, and shortly after fixed his residence at Pinner, near Harrow, where he rented a considerable extent of land, and commenced practical farmer upon a large scale, not however neglecting his official duties. He was always deeply interested in the science of agriculture in all its branches, and frequently in after-life referred to his practical experience as a farmer in support of those doctrines of political economy of which he became a zealous and enlightened advocate.

In 1822 he was induced to relinquish his rural pursuits and again to take up his residence in London. By this time his value had come to be highly appreciated by the government by means of reports which it became his duty to prepare upon subjects connected with the revenue, and in the following year he was appointed to reduce into one simple code the many hundred statutes (upwards of 1500), often contradictory of each other and not unfrequently unintelligible, which at that time formed "the intricate and labyrinthine chaos" of our custom-house legislation. This work had become one of necessity for the guidance as well of the government as of the commercial world. To no other man probably could its performance have been intrusted with anything like the same propriety. Three of the most valuable years of his life were devoted to the task, and to the unremitting labour which he applied to its accomplishment his friends attributed that inroad upon his bodily powers which was visible in the latter years of his life, and which too probably brought him to the grave sooner than with his originally excellent constitution was to be expected. The labour of the task was intense. During its progress he allowed himself no relaxation, and acquired the habit, which he afterwards continued, of working through the hours of the night and far into the morning. Of the value of the work thus performed it is hardly possible for any one to form an adequate estimate who should not have been practically acquainted with the condition of disorder that previously accompanied an important branch of the public business, and into which the acts prepared by Mr. Hume introduced clearness, harmony, and regularity. In the eleven intelligible acts of parliament prepared under Mr. Hume's direction, and passed in 1825, everything was preserved that it was desirable to retain, while all that had become worthless in the many hundreds of repealed statutes was discarded. So intricate and confused had the laws indeed been rendered by successive patch-work pieces of legislation, that even those persons who had made it the study of their lives were often at fault in its application, and the practice of our tribunals upon this branch was frequently contradictory.

So sensible were the ministers by whom this work was intrusted to Mr. Hume of the ability with which it was performed, that he was presented by the treasury on its completion with the sum of 5000*l.* over and above the salary of his office, from the duties of which he had been relieved during the period devoted to the task; and thereafter scarcely any question of importance was decided, having reference to the trade of the country, without his opinion concerning it having first been obtained. So frequent did these consultations become, that a room was fitted up for his use in the office of the Board of Trade; and at length, in July 1829, his services were wholly transferred to that department, where an office was created for him as joint-assistant-secretary. In the performance of the important duties thus intrusted to him, Mr. Hume used the same degree of zeal and intelligence which had marked his previous course, and which secured for him the respect and confidence of the successive chiefs of the department.

At the beginning of 1840 the inroads upon his health, caused by a long life of unremitting labour, were so apparent, that Mr. Hume's retirement from the public service became in a manner necessary. By this time he had completed forty-nine years of active service, forty-four of those years having been passed in situations of responsibility; and he was allowed to retire on a pension of the same amount as the salary attached to his office, which appears by a treasury minute presented to parliament, in which was expressed their lordships' "full approval of his long and faithful services, accompanied by their regret that the public service would be deprived by his retirement of his great experience and of his profound and intimate acquaintance with the mercantile system of this country." The regret thus expressed was in effect uncalled for, as on all occasions, up to the close of his life, on which his advice and experience were desirable, they were freely sought and communicated; and it is probable that at no time during his active career was he able to render more essential services to the best interests of commerce, than by the suggestions made by him after his nominal retirement, and especially by the evidence given by him before the Import Duties Committee of 1840; evidence which, having been frequently quoted with commendation by all parties in the House of Commons, has been brought forward to support measures of reform in our fiscal system proposed and carried in conformity with his recommendations.

After an illness of some weeks' duration, but from which no serious result was apprehended, Mr. Hume was seized with a stupor of an apoplectic character, and two days after died, on the 12th of January, 1842, in the sixty-eighth year of his age.

Although Mr. Hume may almost be said to have lived with the pen in his hand, he published but little, the object of his labours being for

the most part confined to the preparation of official papers, which may nevertheless have exercised a greater influence upon society than could have followed from the publication of his opinions. He wrote however several valuable papers upon subjects connected with commerce, which appeared from time to time in the 'British and Foreign Review.' One of these papers, on the timber trade and duties, may be said to have exhausted the subject. He is better known as the author of a series of letters which, under the signature 'H.B.T.', appeared first in the 'Morning Chronicle,' and have since been collected, and more than once reprinted. These letters contain, within a very small compass, the most admirable and unanswerable arguments for those changes in our fiscal system which have since been carried out, and for which his labours essentially cleared the way. Mr. Hume's style partook of the characteristics of his mind, which was vigorous and original.

HUME, JOSEPH, was born at Montrose in the year 1777. His father was the master of a small coasting-vessel, and after his death his widow supported herself by keeping a shop in Montrose. Having received the merest rudiments of education, including Latin and a smattering of accounts, at a school in his native town, he was apprenticed in his fourteenth year to a surgeon. In 1793 he entered the University of Edinburgh for the purpose of prosecuting his medical studies; and having taken a medical degree, and passed the London College of Surgeons, he was appointed surgeon to an East Indian in 1797. He distinguished himself not only in his medical capacity, but also by acting as purser on his voyage out, and conducting a most complicated business in a very successful manner. On reaching India he mastered the native languages, and, in addition to his functions as an army surgeon, he became Persian interpreter, commissary-general, and pay-master and post-master of the forces in the prize agencies. It is said that he owed the first step of his promotion to his knowledge of chemistry, which enabled him to detect the presence of damp in the government stores of gunpowder on the eve of Lord Lake's Mahratta war. Nothing is more surprising than the amount of hard work performed by the young civilian at this time, and its success enabled him to return to England in the prime of life with a fortune of about 30,000*l*. On returning to England he commenced studying the history and resources of Great Britain, and acquired that insight into the condition of both the government and people which formed the foundation of his subsequent exertions in the cause of reform. In the same spirit he visited a large portion of the Continent, and made a tour through Spain, Portugal, Turkey, Greece, and Egypt, to increase his stores of political experience.

In 1812 he entered parliament under the auspices of the late Sir J. Lowther Johnstone, Bart., as member for Melcombe Regis, which now forms part of the borough of Weymouth, but failed to secure his re-election in the autumn of the same year. In the interval between this date and 1818 he became acquainted with Place, Mill, and other disciples of the school of Jeremy Bentham; and devoted considerable time and energy to the foundation of savings banks and of schools on the Lancastrian system. He was also a candidate—though an unsuccessful one—for a seat at the Board of East India Directors. In 1818 he re-entered parliament as member for the Montrose burghs, for which he continued to sit without interruption until 1830, when he was chosen by the constituency of Middlesex. He represented that county during all the period of agitation which preceded the passing of the Reform Act down to 1837, when he was defeated, but returned through the influence of Mr. O'Connell for Kilkenny. In 1841 he contested Leeds without success; but in the following year was re-elected for his native Montrose burghs, which he represented down to his death, a period of thirteen years.

For many years Mr. Hume stood nearly alone in the House of Commons as the advocate of Financial Reform: indeed in the cause of reduction of taxation and public expenditure no man ever did so much practical good as Joseph Hume, through a long career of perseverance and industry. Disregarding the fashion of the age and the opinions of the world, he adhered in the smallest matters to what he thought just and right. In most of the political and social movements of the last quarter of a century he was an important actor: the working man eats bread which he helped to cheapen, walks through parks which he helped to procure for him, and is in a fair way to attain farther educational advantages in consequence of his exertions. He more than once refused to accept office under Liberal governments, and he devoted a part of his own wealth to the social and political objects which he had in view. His speeches delivered in parliament occupy in bulk several volumes of 'Hansard's Debates.' He incessantly advocated reforms of our army, navy, and ordnance departments, of the Established Church and Ecclesiastical courts, and of the general system of taxation and the public accounts. He early advocated the abolition of military flogging, naval imprisonment, and imprisonment for debt. With little active assistance, he carried the repeal of the old combination laws, the laws prohibiting the export of machinery, and the act for preventing mechanics from going abroad. He was unceasing in his attacks on colonial and municipal abuses, election expenses, the licensing systems, the duties on paper and printing, and on articles of household consumption. He took an active part in carrying Roman Catholic emancipation, the repeal of the Test and Corporation Acts, and in the passing of the Reform Act of 1832. A remarkable passage in his life was his discovery, in 1835,

of an extensive Orange plot, commencing before the accession of William IV. An account of this transaction, in all the minuteness of detail, will be found in Miss Harriet Martineau's 'History of the Thirty Years' Peace.'

The health of Mr. Hume began to break soon after the parliamentary session of 1854, and he died at Burnley Hall, his seat in Norfolk, on the 20th of February 1855. At the time of his death he was a magistrate for Norfolk, Westminster, and Middlesex, and a deputy lieutenant for the latter county. As a proof of the general esteem in which he was held, we may add, that in the House of Commons speakers of all parties took occasion to pay a tribute to his character. He married a daughter of the late Mr. Burnley, by whom he left a family of several sons and daughters. His eldest son is Mr. Joseph Burnley Hume, barrister-at-law.

HUMMEL, JOHANN-NEPOMUK, a composer and performer on the pianoforte highly distinguished during the present century, was born at Presburg in 1778. At a very early age he received instructions in music from his father, a master at the military institution of Wartberg, and evinced so decided a talent that, when he had scarcely completed his seventh year, he was sent to Vienna, and placed under Mozart, who, though he had a natural repugnance to teaching, took so promising a genius into his house as a pupil, where he remained two years, and imbibed much of the knowledge and laid the foundation of that fine taste which at a later period of life were developed in so striking and profitable a manner. In his tenth year he set out on a visit to the principal cities of Germany, Denmark, and Holland, and reached London in 1791, where he was much noticed, and had the honour to perform at Buckingham House before the royal family.

At the expiration of six years Hummel returned to Vienna, pursued the study of composition under Albrechtsberger, and further improved himself by friendly intercourse with Salieri. In 1803 he engaged in the service of Prince Esterhazy; and a few years after, when the Imperial Theatre fell into the hands of some noblemen, with that wealthy and powerful prince at their head, Hummel took an active part in the management, and produced several successful operas. In 1811 he withdrew from the prince's establishment, and wholly dedicated the next five years to the lucrative branches of his profession.

In 1816 he became Kapellmeister to the King of Württemberg, in whose service he remained till the year 1818, when he engaged himself in the same capacity to the Grand-Duke of Weimar, which appointment he retained to the close of his life. But his duties at the court of Weimar were not of a nature to prevent his frequent journeys to other countries. In 1821 he made a very profitable visit to St. Petersburg and Moscow, and two years after to Amsterdam. In April 1830 M. Hummel arrived in London, and immediately gave a concert at the Hanover-Square Room, which was so crowded, and his performance of his own compositions made so great a sensation, that it was followed by two other concerts in May and June, which were as fully attended as the first. This success induced him to return in the spring of the following year, when he also gave three concerts; but trusting too much to his individual exertions, they proved rather less attractive than those of the preceding season. In 1833 he repeated his visit to London, and a single concert convinced him that his popularity had deserted him: he was no longer new, and had no connection to supply the want of that novelty for which in our fashionable circles there is so insatiable a thirst. M. Hummel returned to Weimar, and had the order of the White Eagle conferred on him. He died of water on the chest, in October 1837, leaving a widow and two sons amply provided for by a good fortune acquired by his talents and accumulated by his prudence. M. Hummel's compositions are very numerous. Of his operas, 'Mathilde von Guise' is the best; and in his two masses—in D minor and E flat—are clever and charming movements. But his reputation will rest on his pianoforte works: some of these will not soon be forgotten, particularly his beautiful and masterly concerto in a minor.

* HUNT, JAMES HENRY LEIGH, was born at Southgate in Middlesex, October 19, 1784. His father, by birth a West Indian, had married an American lady, and was residing in North America when the war of Independence broke out. Taking the loyalist side in the strife, he was obliged to flee to England, where he took orders in the English Church, and was for some time tutor to Mr. Leigh, nephew of the Duke of Chandos. Of several sons Leigh became the most distinguished: he was educated, as his friends Coleridge, Charles Lamb, and Barnes, afterwards well known as editor of the 'Times,' had been, at Christ's Hospital, London; and even while there he revealed his natural genius for literature by numerous attempts in verse, some of which were published in 1802 by his father, under the title of 'Juvenilia, or a Collection of Poems written between the ages of twelve and sixteen.' After leaving Christ's Hospital, at the age of fifteen, he was for some time in the office of one of his brothers, who had become an attorney, and afterwards he had a situation in the War-office. While in these employments he contributed to various periodicals; writing, more especially, theatrical criticisms and literary articles for a weekly newspaper which had been started in 1805 by his elder brother, John Hunt. Of his theatrical criticisms, which were in a style then quite new, a selection was published in 1807 in a more lasting form, in a volume of 'Critical Essays on the Performers of the London Theatres.'

In 1808 Mr. Hunt left the War-office, at the age of twenty-four, to become joint-editor and joint-proprietor of the 'Examiner' newspaper—a journal, the high reputation of which, both for liberal politics and for literary ability, was first acquired under the management of the Hunts. The reputation however was not acquired, in those days of political persecution, without some serious personal consequences to the partners. Although more literary than political in his tastes, the articles of Leigh Hunt, as well as those of his brother, were of a kind to give offence to the ruling powers of the day; and on three several occasions the 'Examiner' had to stand a government prosecution. On the first occasion, in 1810, when the cause of offence was an article on the Regency, reflecting on the rule of George III., the prosecution was abandoned; on the second, which was caused in 1811 by an article on Flogging in the Army, the brothers were tried before Lord Ellenborough, but being defended by Mr. Brougham, were acquitted by the jury; on the third however, when the cause was an article referring to the Prince Regent in rather severe terms, and calling him "An Adonis of fifty," the brothers were sentenced to pay a fine of 500*l.* each, and to two years' imprisonment. The imprisonment, though actually undergone, was lightened by the public sympathy with the captives; and Leigh Hunt describes the two years as being spent very pleasantly amid flowers and books, with occasional visits from friends, such as Byron, Moore, Charles Lamb, Shelley, and Keats, some of whom he then became acquainted with for the first time. Keats's sonnet, 'Written on the day that Mr. Leigh Hunt left Prison,' is a fine poetical expression of the affection with which Mr. Hunt was regarded at that time by a wide circle of literary friends. Among the literary fruits of his leisure in prison, published after his release, were 'The Descent of Liberty, a masque,' 1815; 'The Feast of the Poets, with notes, and other pieces, in verse,' 1815; and the well-known 'Story of Rimini,' 1816—the last of which gave the author at once a place among the poets of the day. In 1818 appeared 'Foliage, or Poema, original, and translated from the Greek of Homer, Theocritus, Bion and Moschus, and Anacreon, and from the Latin of Catullus.' About the same time Mr. Hunt started the 'Indicator,' a small weekly paper, on the model of the Queen Anne Essayists. In 1823 he published 'Ultra-Crepidarius, a Satire on William Gifford'—a retaliation on the 'Quarterly Review' for its severe treatment of the school of poetry to which Mr. Hunt was most closely related. Before this satire was published however, Mr. Hunt, whose circumstances had not recovered from the confusion into which they were thrown by his imprisonment and by the expenses of the 'Examiner,' had accepted an invitation from Shelley and Lord Byron, and gone over to Italy (1822) to assist them in carrying on 'The Liberal,' a journal the opinions of which were to be of an extreme kind both in politics and literature. The death of his kindest friend, Shelley, at the very moment of his arrival (July 1822), was a heavy blow to his fortunes; and, though Mr. Hunt lived for a time under the same roof with Lord Byron, the connection was not of a kind to last. 'The Liberal' was discontinued—Byron and Hunt parted, less mutually friends than when they had met. Byron died in 1824; and after living with his family some time in Italy, Mr. Hunt returned to England. The publication in 1823 of 'Lord Byron and some of his Contemporaries, with Recollections of the Author's Life and his Visit to Italy,' gave much offence to Lord Byron's admirers, and especially to Moore; and Mr. Hunt has himself subsequently declared the criticisms of Byron's personal character and behaviour there contained to be unnecessarily harsh and bitter. In 1828 Mr. Hunt (who had meanwhile been contributing largely, together with Lamb, Hazlitt, &c., to various periodicals, including the 'London Magazine') started 'The Companion,' a kind of sequel to the 'Indicator;' and the 'Indicator and Companion,' republished together in 1834, has been deservedly among the most popular of modern collections of light and fanciful essays. In 1833 was published a collected edition of Leigh Hunt's poetical works, since superseded by later editions, which include, in addition to other later poems, his celebrated 'Captain Sword and Captain Pen,' first published separately in 1835. In 1834 he started a new serial, 'The London Journal,' which he continued to edit during that and the following year; he then wrote for periodicals till 1840, when he published 'A Legend of Florence, a play' (acted with some success at Covent-Garden), and several parts of a new serial, called 'The Seer, or Commonplaces Reported,' and also edited the 'Dramatic Works of Wycherley, Congreve, Vanbrugh, and Farquhar.' These works were followed in 1842 by 'The Palfrey, a Love Story of Old Times,' and 'One Hundred Romances of Real Life, selected and translated,' 1843. A larger work of fiction was 'Sir Ralph Esher, or Memoirs of a Gentleman of the Court of Charles II.,' a new edition of which appeared in 1850. Of Mr. Hunt's later works the following are the chief:—'Imagination and Fancy' (a series of extracts from the English Poets, with five critical elucidations and a preliminary essay on poetry), 1844; 'Wit and Humour' (a similar collection), 1846; 'Stories from the Italian Poets, with Lives' (a collection of admirably translated pieces), 1846; an edition of the 'Dramatic Works of Sheridan,' with biography and notes, 1846; 'Men, Women, and Books, a selection of Sketches, Essays, and Critical Memoirs,' 1847; 'A Jar of Honey from Mount Hybla' (a collection in prose and verse), 1848; 'A Book for a Corner' (also a collection of pieces in prose and verse), 1849; the author's 'Autobiography,' in 3 vols., 1850; a volume of 'Table-Talk, with Imaginary Conversations of Pope and

Swift,' 1851; 'The Town, its remarkable Characters and Events' (a delightful book of gossip about London streets), 2 vols., 1848; 'The Religion of the Heart, a Manual of Faith and Duty,' 1863; a collection of 'Stories in Verse,' from the author's earlier writings, 1856; and 'The Old Court Suburb, or Memorials of Kensington, regal, critical, and anecdotical,' 2 vols., 1855. In 1847 Mr. Hunt received from the crown a literary pension of 200*l.* per annum, which he still enjoys, with the goodwill of thousands whom his numerous writings, both in prose and in verse, have instructed and charmed, and among whom he is the representative of an age of poets now all but vanished.

* HUNT, ROBERT, a writer and popular lecturer on the physical sciences, was born September 6th, 1807, at Devonport, in Devonshire. He was brought up to business, and owes his scientific position to his own unaided efforts. In the earlier part of his career his knowledge of chemistry and fondness for science recommended him to the Cornwall Polytechnic Society, of which he was secretary for five years. In this position he devoted considerable time and attention to the study of mineral veins and metalliferous deposits. He was thus recommended to the attention of Sir Henry de la Beche, and shortly after the opening of the Museum of Economic Geology, Mr. Hunt was appointed Keeper of the Mining Records. When this institution was removed to Jermyn-street, Mr. Hunt was appointed professor of mechanical philosophy, an office which he has since resigned.

Mr. Hunt first became known as an author by his 'Researches on Light,' published in 1844. In this work he gave a general account of the physical phenomena of light, and drew more particular attention to the chemical action exerted by some of the rays, which he first named 'actinic.' In 1848 he published a work called the 'Poetry of Science,' in which he drew attention more especially to the action of the great forces in nature—heat, light, and electricity. This was succeeded by a work of a more imaginative character, entitled 'Panthea, or the Spirit of Nature.' On obtaining the position of professor of mechanics at the Museum of Practical Science, he published an elementary treatise on physics, which has since been published in a cheap form. From the time of the discoveries of Daguerre and Fox Talbot, Mr. Hunt has taken great interest in the art of photography, and has written a manual for the guidance of those who would practise it. He has also contributed a report to the 'Transactions' of the British Association on the influence of the rays of light on the growth of plants. Besides this, he has been a frequent contributor to many of the literary and scientific journals. He took an active part in the arrangements of the Great Exhibition in 1851, and wrote an essay upon the science involved in that great display of human industry. Mr. Hunt is well known throughout the country as an able and eloquent lecturer on the various departments of science to which he has turned his attention.

* HUNT, WILLIAM, one of the most original of the English school of painters in water-colours, was born in London in 1790. Of his early studies we have no information, but there can be little doubt that, as an artist, his style was formed on the Dutch and Flemish painters of homely, and what is termed 'still' life. Mr. Hunt became a member of the Society of Painters in Water-Colours in 1824, and from that year to the present his works have formed an unfailing source of attraction at the annual exhibitions of that society. Offering but a confined range of subjects, and utterly devoid of all imaginative or poetic flights, his pictures, in their downright matter-of-fact fidelity to nature, and their entire freedom from pretence and affectation, have won the suffrages of all classes of visitors and critics. In looking over the long file of exhibition catalogues, and drawing upon the stores of memory, we are almost astonished to find with how little deviation Mr. Hunt has for more than forty years trod and retrod his chosen path, and at the same time how we have continued to receive, not only without wearisomeness but with ever new pleasure, the specimens he has picked up in his way. And these specimens are just such "common things" as a more profound or scientific collector would be most likely to look down upon as beneath his notice. For year after year he has shown us some healthy, ruddy, broad-faced, ugly and stolid, but thoroughly good-tempered 'peasant boy,' in green smock-frock and battered felt, either (as the 'Catalogue' carefully informs us) 'laughing' or 'crying;' 'idle,' 'tired,' 'sleeping,' or 'fast-asleep;' 'scared,' 'astonished,' or downright 'panic-struck;' 'catching flies' or 'blowing bubbles,' or 'giving himself (h)airs;' 'going to bed,' or 'doing penance' on a stool; 'puzzling over a sum,' or some 'long word' in 'a spelling lesson;' 'amusing himself and terrifying his juniors with a 'paper lantern,' or 'a turnip bogie;' or else contemplating the charms of some 'sleeping beauty,' and affording our painter a new reading of 'Cymon and Iphigenia.' Or he has presented a nearly parallel series of portraits of his favourite 'peasant girl,' showing her either as 'the village pet' or 'farm-house beauty;' as 'nursing a pig;' in her best frock as a 'Sunday scholar,' or perchance as he caught her 'fast asleep' when she ought to have been busy at work. Of course he loitered awhile now and then with an adult 'hermit,' an 'old pilot,' or a 'fisherman,' or occasionally amused himself by sketching a mulatto girl or a negro boy (whom he names 'Maesa Sambo'); but he has shown decisively that his delight has all along been in watching the growth and noting the doings of the many generations of young urchins whom he has seen in turn succeed to each other's tricks as well as places. At the same time he has never neglected to observe

and commemorate the bounties of nature as shown in the hedgerow or the orchard, or even refused to stoop and admire what an art-critic in high repute when Mr. Hunt commenced his career termed 'ditch trumpery.' Like a thorough Londoner he scarce ever lets a season pass without going into the fields to gather a 'bunch of May' (as he always affectionately names the hawthorn-blossom), and never before was the 'May' so exquisitely painted, as probably it never again will be. But 'apple-blossoms,' 'plums,' 'grapes,' 'birds'-nests and eggs, 'primroses,' even 'mossy stones' have engaged equally careful if not quite such frequent notice, and each in its turn has formed the subject of a charming little picture. Belonging to a more exotic class are 'grapes and quinces,' 'pine-apples,' and 'preserved ginger.' Then again we have in-door themes, generally designated as 'interiors,' whether of 'cottage' or 'church,' 'wood-house' or 'laboratory,' kitchen or drawing-room; and all painted with the same rigorous fidelity. If we add a few simple figure-pieces of a loftier aim, as 'Devotion,' 'The Oratory,' 'Asking a Blessing,' &c., and a few studies of 'oak-trees' and the like, we shall have pretty well exhausted the titles of Mr. Hunt's almost unlimited number of pictures. Their character is even more uniform than their subjects. No one lays claim to be more than an accurate representation of a simple object; but whatever that object be, it is evident that nothing less than that claim will be admitted. Everything is painted with the most scrupulous attention to truth of form, local colour, and natural light and shadow, exactness and variety of texture, and statement of details; yet the painter-like breadth of effect is never disturbed. In his peasant boys and girls, with the least possible exaggeration, there is ever the most unmistakable rusticity of character and expression, and the idea is conveyed at once broadly and lucidly, yet not seldom with a keen dry touch of genuine humour. His manipulative dexterity could only have been acquired in the comparatively intractable materials he employs (though he makes free use of body colour) by long years of incessant practice and diligent observation, followed out with that thorough enjoyment in his occupation which all his works evince; but the spirit which animates them can only be ascribed to native genius.

* HUNT, WILLIAM HOLMAN. About 1849 or 1850, when mediævalism in theology and architecture was at its height, a few painters, all very young and mostly fellow-students in the Royal Academy, became converts to the prevalent fashion. They had before them the example of the great restorers of historical and religious art in Germany, who some forty years previously had associated themselves together in the hope, by devoted and exclusive study of the early 'Christian' painters—Giotto, Francia, Masaccio, Perugino, &c.—to restore to art the religious depth, earnestness, truth and simplicity, which had characterised it at the date of those masters, and which it had, as they averred, lost under the dominion of their successors, Raffæle, Michel Angelo, Titian, and Correggio, who had drawn their inspiration rather from classical and Pagan than Christian and ecclesiastical sources. Adopting somewhat similar views, though only adopting them in part, and in practice carrying them out on an infinitely smaller scale, our young English painters resolved in like manner to cast off the trammels of modern examples; and as a pledge of their purpose, announced themselves to the world as the 'Pre-Raphaelite Brethren.' Among these from the first Mr. Hunt took a foremost place, and while others of the fraternity have grown lukewarm, or apostatised, he has hitherto continued steadfast in the faith.

Prior to this period he had been for three or four years a contributor to the exhibitions of the Royal Academy, but his works had all been of the usual character. His first picture, sent in 1846, was entitled 'Hark;' then followed 'A Scene from Woodstock,' another from Keats's 'Eve of St. Agnes;' and then, in 1849, one from Bulwer Lytton's 'Rienzi.'

In 1850 appeared the first of the Pre-Raphaelite series, 'A Converted British Family sheltering a Christian Missionary from the Persecution of the Druids;' in 1851 there followed a Pre-Raphaelite reading of 'Valentine rescuing Sylvia from Proteus;' in 1852 the 'Hiring of the Shepherd;' in 1853 'Claudio and Isabella,' and a remarkable bit of landscape, 'Our English Coasts;' in 1854 the 'Light of the World' and the 'Awakened Conscience;' and in 1856—Mr. Hunt having in the interval gone to the Holy Land with a view to make studies for scriptural designs—'The Scapegoat.'

That these pictures exhibited very considerable and every year increasing artistic power there could be no question. But the application of that power has called forth considerable difference of opinion. Briefly it may be said, that Mr. Hunt's pictures are characterised not by an imitation of the manner, or an attempt to catch the tone of thought which distinguishes the works of Raphael's predecessors, but (along with a little perhaps that might be regarded as approximating to the mediæval misal spirit) by a studious observation of the minutiae of nature, and the most accurate and specific imitation of details. To the ordinary observer however it appears as though for the most part this minute accuracy is obtained by the neglect of a broad or comprehensive survey. Each portion of the picture seems to be painted as though the eye were engaged in making a picture of it alone. The flower in the foreground, or the lichen on the distant wall, is painted as though for the illustration of a botanical description, while the influence of intervening atmosphere, the proximity of more attractive

objects, or the occurrence of some absorbing event is overlooked or disregarded. A peculiarity in the skin of the model, the exact marking of a piece of lace, is elaborately rendered, but mental expression appears uncared for, and the countenance is a blank. Thus it happens that while from the extraordinary faithfulness of the details the painting appears admirable when examined bit by bit, it becomes to an eye not schooled in the new philosophy of art, painful when regarded as a whole, from what would seem to be the absence of all comprehensiveness of grasp, largeness of conception, or breadth of thought. Still this truthfulness in detail, even when unaccompanied by unity of view and grandeur of composition, is, as a matter of executive art, better than the vague conventional generalizations which had for some time too commonly prevailed, and against which it was the perhaps overstrained reaction; and to Mr. Hunt and his compatriots is due the credit of acting to a certain extent as pioneers in the truer way towards which it may be hoped the English historical school of art is approaching.

But there is no sufficient reason why Mr. Hunt should not himself be a leader in that better way. He is still very young—little we believe above thirty—he possesses a very unusual amount of technical knowledge and manipulative skill, and he has shown that he can think and act for himself. To become a truly great painter however—in the sense in which the eminent men of old were great as painters or poets—it will be necessary for him to reflect more deeply on the purpose and the limits of his art, to learn that he must appeal to the common heart and common sense of mankind, rather than to a sectional sentiment and an exoteric understanding, and gain comprehensiveness of vision by larger intercourse with nature and deeper study of the human mind, as shown in the works of great poets and imaginative writers, as well as painters. As yet the grand mistake of Mr. Hunt (as of the Pre-Raphaelites generally), apart from the question of minute imitation, has been in his choice of subjects, and the point of view from which he has regarded them. Too often he selects a theme which might make an angel pause, and at once brings it down to the commonest realities of life. The picture is worked out with the utmost practicable realism of style, and yet a profound religious purpose is claimed for it. Thus Mr. Hunt's last two pictures have been symbolical representations—so his admirers say, and his notes on the frames and in the catalogues intimate—of the second person in the Trinity: a subject it is needless to observe which every right-minded person will approach with the profoundest reverence. The first of these pictures (1854) was entitled the 'Light of the World,' and in it the glorified Redeemer is depicted in the gawdy vestments of a Romish priest, bedizened all over with gilt embroidery and jewellery, and bearing in his hand a lantern of indubitable modern manufacture. Again in his last picture, 'The Scapegoat' (1856), we have a representation of the Dead Sea and the hills of Edom, painted on the spot, with a most minutely careful rendering of the present appearance of every part of the scene, while occupying the foreground is a large and ugly goat, which has been hunted almost to death, and with all the symptoms of exhaustion faithfully copied; and this is we are informed to be regarded as the symbolic representation of Him who bore the sins of the world. It may well be doubted whether any artistic skill or devotional treatment could render such subjects other than repugnant to the feelings of the larger portion of the painter's countrymen, or indeed whether they are not altogether beyond the limits of the painter's art.

HUNTER, JOHN, was born in 1723, at Long Calderwood, in Kilbride, a village near Glasgow, where his father possessed a small farm. Being the youngest of ten children, and his father dying when he was very young, his education was almost entirely neglected. His whole time was devoted to the amusements of the country till he was seventeen years old, when he went to stay with his brother-in-law Mr. Buchanan, who was a cabinet-maker at Glasgow, and who needed his assistance to extricate him from some pecuniary difficulties. Hunter worked at the trade for nearly three years, and probably thus acquired much of his manual dexterity. At the end of that time, hearing of the great success which his brother [HUNTER, WILLIAM] had met with in London as an anatomical and surgical lecturer, he wrote to offer him his services as assistant in the dissecting-rooms. His offer was accepted, and in 1748 he commenced his anatomical studies, in which he at once distinguished himself both by his arduous and his skill. In 1749 Hunter became the pupil of Cheselden, then surgeon to Chelsea Hospital, where he attended for nearly two years, and in 1751 he went to St. Bartholomew's Hospital, and attended the practice of Mr. Pott. In 1753 he entered as a gentleman-commoner at St. Mary's Hall, Oxford, intending to practise as a physician; but he seems soon after to have given up this idea, for in 1754 he entered as a surgeon's pupil at St. George's Hospital, in the hope of becoming at some future time a surgeon to that institution. In the same year his brother made him his partner in the school, and he delivered a part of each annual course of lectures till 1759, when his constant and severe labours in anatomy, to which he had lately added comparative anatomy and physiology, began to affect his health so seriously that it became advisable for him to resort to some milder climate. With this view he obtained an appointment as staff-surgeon, and early in 1761 proceeded to Belle-Isle with the armament ordered to lay siege to that town. He afterwards went to the

Peninsula, and remained in active duty till the end of 1763, when a peace was negotiated, and, his health being completely restored, he returned to London, and commenced practice.

At first Hunter met with little success in his profession; the roughness of his manners, the consequence in part of his hasty disposition, but more of his deficient education, prevented him from rising in public estimation. Besides, he paid but little attention to his practice, regarding it, as he always did, only as a source from which he might obtain the means of carrying on the scientific investigations to which he was far more attached, and which he had steadily pursued while in the army. To defray the expenses which these entailed, he again commenced lecturing on anatomy and surgery; but notwithstanding the talent and extensive knowledge which his lectures evince, they were little appreciated, and he never had a class of more than twenty pupils, so that he was constantly obliged to borrow money for the purchase of animals and other similar purposes, after he had spent on them all that he did not require for the actual necessities of life. Every year however added to his reputation, and in 1767 he was elected a Fellow of the Royal Society, and in 1768 surgeon to St. George's Hospital. The latter appointment was of the greatest value to him; it increased his income, both by adding to his surgical reputation, and by enabling him to take pupils, from whom he received large fees. Among his pupils were Jenner, with whom he remained throughout his life on terms of the closest intimacy, and Sir Everard Home, whose sister he afterwards married. From the time of his appointment to St. George's, Hunter's life was occupied with a constant and laborious investigation of every branch of natural history and comparative anatomy, physiology, and pathology, to all of which he devoted every hour that he could snatch from the requirements of an increasing surgical practice. In 1773 he suffered from the first attack of the disease of the heart, of which he ultimately died. He had a severe spasm of the chest, and remained pulseless and cold, though perfectly sensible, for three-quarters of an hour. For many years after however his health seemed pretty good, and he was subject to slighter returns of the disease only when much excited or fatigued; but in 1785 the attacks became more frequent, and he was obliged to leave London. In the following years he became gradually more debilitated, and the slightest fit of anger, to which he was unfortunately prone, was sufficient to induce severe spasms. In October 1793 he was engaged in warm disputes with his colleagues at the hospital; and a remark being made by one of them at a meeting of the governors, which Hunter regarded as an insult, he left the room that he might repress or at least conceal his rage, and had scarcely entered the adjoining apartment, when he fell dead in the arms of Dr. Robertson, one of the physicians of the hospital.

The extent and importance of John Hunter's works will be best shown by a brief account of his museum and his chief publications. The museum consisted, at the time of his death, of upwards of 10,000 preparations, illustrative of human and comparative anatomy, physiology and pathology, and natural history. The main object which he had in view in forming it was to illustrate as far as possible the whole subject of life by preparations of the bodies in which its phenomena are presented. The principal and most valuable part of the collection, forming the physiological series, consisted of dissections of the organs of plants and animals, classed according to their different vital functions, and in each class arranged so as to present every variety of form, beginning from the most simple, and passing upwards to the most complex. They were disposed in two main divisions: the first, illustrative of the functions which minister to the necessities of the individual; the second, of those which provide for the continuance of the species. The first division commenced with a few examples of the component parts of organic bodies, as sap, blood, &c.; and then exhibited the organs of support and motion, presenting a most interesting view of the various materials and apparatus for affording the locomotive power necessary to the various classes of beings. It was succeeded by a series illustrating the function of digestion (which Hunter placed first because he regarded the stomach as the organ most peculiarly characteristic of animals), and those of nutrition, circulation, respiration, &c. These were followed by the organs which place each being in relation with the surrounding world, as the nervous system, the organs of sense, the external coverings, &c. The other chief division of the physiological part of the collection contained the sexual organs of plants and animals in their barren and impregnated states; the preparations illustrative of the gradual development of the young, and of the organs temporarily subservient to their existence before and after birth. Parts of the same general division, though arranged separately for the sake of convenience, were the very beautiful collections of nearly 1000 skeletons; of objects illustrative of natural history, consisting of animals and plants preserved in spirit or stuffed, of which he left nearly 3000; of upwards of 1200 fossils; and of monsters.

The pathological part of the museum contained about 2500 specimens, arranged in three principal departments: the first illustrating the processes of common diseases and the actions of restoration; the second the effects of specific diseases; and the third the effects of various diseases arranged according to their locality in the body. Appended to these was a collection of about 700 calculi and other norganic concretions.

These few words may give some idea of Hunter's prodigious labour and industry as a collector. But his museum contains sufficient proof that he was no mere collector; it was formed with a design the most admirable, and arranged in a manner the most philosophic; and when it is remembered that it was all the work of one man, labouring under every disadvantage of deficient education, and of limited and often embarrassed pecuniary resources, it affords perhaps better evidence of the strength and originality of Hunter's mind than any of his written works, where he speaks of the facts which in his museum are made to speak for themselves. Nor should it be omitted that the manual dexterity exhibited in displaying the various objects is fully equal to the intellectual power which determined their arrangement. The museum was sold after Hunter's death to pay the debts which he had incurred in its formation, and to afford the means of support to his family, to whom it was almost all that he had to leave, although for many years before his death he had been earning a very large income. The government gave 15,000*l.* for it, and presented it to the College of Surgeons, London, by whom it has been greatly augmented.

For several years before his death Hunter had been anxious to form a complete catalogue of his collection, and to embody in one large work the results of all his labours and observations. He died when he had completed but a small portion of his design, and left only the materials, with which his successors might have completed a work which would undoubtedly have been the most valuable of its kind ever published. These materials were contained in nineteen folio manuscript volumes written under Hunter's dictation, and the ten most valuable of them contained records of his dissections, of all of which he had made copious notes. The formation of the catalogue was intrusted to Sir Everard Home, the brother-in-law and only surviving executor of Hunter; but from year to year he deferred his task, and after supplying only two small portions of his undertaking, he at length announced that, in accordance with a wish which he had heard Mr. Hunter express, he had burned the manuscripts which he had taken without leave from the College of Surgeons, and among which were the ten volumes of dissections, and numerous other original papers. Thus nearly the whole labours of Hunter's life seemed lost: a few only of the least important of his writings remained, unless indeed we reckon as his the numerous essays which Sir E. Home published as his own in the 'Philosophical Transactions,' and subsequently collected in 6 vols. 4to of 'Lectures on Comparative Anatomy.' Many of these give strong evidence of his having used Hunter's writings in their composition; and the fear lest his plagiarism should be detected is the only probable reason that can be assigned for so disgraceful an act. The papers being thus lost, the formation of the catalogue was necessarily dependent on the arrangement of the preparations themselves, the published works, and the few scattered manuscripts that remained, and such information as those who had associated with Hunter could give. By these means however, and by making numerous fresh dissections, and comparing them with the original preparations, the catalogue was eventually formed in a manner which, although it could not compensate for the loss of the other, conferred the highest credit on those by whom it was made.

Hunter's principal published works were the 'Treatise on the Natural History of the Human Teeth,' 2 vols. 4to, 1771-78; 'Treatise on the Venereal Disease,' 4to, 1786; 'Observations on Certain Parts of the Animal Economy,' 4to, 1786; and 'Treatise on the Blood, Inflammation, and Gun-Shot Wounds,' 2 vols. 8vo, 1794. Of these the two last afford the best proofs of his genius. The 'Animal Economy' consists of a republication of several papers from the 'Philosophical Transactions,' and of nine others relating to various anatomical and physiological discoveries which Hunter had made. It is difficult to say which deserves the most admiration, the faultless accuracy of the observations themselves, or the clearness and simplicity of the deductions drawn from them. His 'Treatise on the Blood,' &c., although he had been collecting materials for it from the time of his entrance into the army, was not written till late in his life, when he was worn down by disease; and it was rather carelessly completed after his death by his executors, Sir E. Home and Dr. Baillie. It contains his opinions on disease in general, the results of his long experience, illustrated by numerous physiological investigations. As a collection of observations these volumes are invaluable; but it is unfortunate that Hunter's reputation has been based upon them rather than upon his museum or his strictly physiological writings, for in the former his mode of reasoning is often obscure and hasty, and his conclusions far more general than the evidence warranted. His doctrines were purely vital. The 'materia vite diffusa,' a term which he says was recommended to him by his friends to express the power, or, as he supposed, the subtle matter, which he believed to be contained in the blood and all the tissues, and to govern all the functions of the living body, was to him the sole agent in the phenomena of life. But his errors were those of ignorance of collateral subjects, rather than of a deficient acquaintance with that which he made the object of his study; and when we consider that he was so little educated, that he was not even well acquainted with his own language, and was ignorant of all others, and that he had only the most superficial knowledge of the physical sciences, which every year now shows to have more applications in the study of the living body, we can only wonder the more at the genius which could surmount such difficulties.

Hunter is, by the common consent of all his successors, the greatest man that ever practised surgery. Considered merely as a surgeon, and with reference only to the direct improvements which he effected in its practice, he stands inferior to few: his improvement of the operation for aneurism was undoubtedly the most brilliant discovery in surgery of his century. He first described the important disease of inflammation of the veins; he first published lucid views on the venereal disease; and by his work on inflammation improved the modes of practice applicable to nine-tenths of the diseases which fall within the province of the surgeon. But it was less by individual discoveries than by the general tone of scientific investigation which he gave to surgical practice that he improved it. Before his time surgery had been little more than a mechanical art, somewhat dignified by the material on which it was employed. Hunter first made it a science, and by pointing out its peculiar excellence as affording visible examples of the effects and progress of disease, induced men of far higher attainments than those who had before practised it to make it their study.

As an anatomist and physiologist, his museum alone is sufficient to show that he has had no superior; and while his published works confirm this opinion, and exhibit what he knew, they add to the regret that so much more should have been lost. Every year, as his museum is more closely studied, proves that Hunter had been well aware of facts for the discovery of which other observers have since his death received the honour. His remarks on fossil bones, for example, evince his knowledge of the principle carried out by Cuvier, by which their investigation might be made the clue to the history of a former world. His notices, though short, of monstrosities prove that he knew the fact that they are, as it were, representations of the natural form of animals lower in the scale of creation, and possess the form natural to themselves at an earlier period of development, a law since more fully demonstrated by Geoffroy St. Hilaire, Meckel, Von Baer, &c.; and it is now certain, from the drawings which he had made from his preparations, that he was well acquainted with nearly the whole of that most interesting department of physiology which relates to the development of the embryo. The number of individual facts, for the discovery of which he has lost his due honour by the destruction of his manuscripts, cannot now be calculated.

As a natural historian, Hunter's merits were of no ordinary character, as is sufficiently shown by his descriptions of various animals from New South Wales, published in Mr. White's 'Voyage' to that country, and by his papers on the wolf, &c. He seems however to have regarded the study of zoology as very inferior to that of physiology, and it is probable that the large collection of animals which he left preserved in spirit was only intended as a store of subjects for future dissection.

The whole of John Hunter's works have been edited in 4 vols. 8vo by Mr. James F. Palmer, who has added to those published by himself numerous papers from different periodicals, his surgical lectures, from notes taken by some of his pupils, and his Croonian Lectures. Biographies of Hunter have been written by Sir Everard Home, Mr. Jesse Foote, and Dr. Adams. A life by Mr. Drewry Ottley is prefixed to Mr. Palmer's edition of his works.

*HUNTER, REV. JOSEPH, son of Mr. Michael Hunter, was born at Sheffield, and educated at York for the ministry among the English Presbyterian Dissenters, and was for twenty-four years their minister at Bath, where he collected materials for an interesting work, 'The connection of Bath with the Literature and Science of England.' He also published, besides other works, his 'History of Hallamshire,' in one vol. fol., the 'Hallamshire Glossary,' 'English Monastic Libraries,' and his great work on the 'History and Topography of the Deanery of Doncaster, South Yorkshire.' He likewise edited several works for the Record Commission. In 1833 he accepted the post of sub-commissioner of the Public Records, and from that time he has been industriously occupied in that department. His indefatigable zeal has lately been directed to the arranging of the records of her Majesty's Remembrancer of the Exchequer in Carlton Ride, thus rendering accessible a large amount of Record Evidence previously useless. Since the commencement of his official career he has found time even amid his laborious toils to produce 'Illustrations of the Life, Studies, and Writings of Shakespeare,' a 'Disquisition on the Scene, Origin, and Date of the Tempest,' as also various other works on Archæology and Ecclesiastical history. He has been a liberal contributor to the 'Archæologia,' the 'Retrospective Review,' and the Archæological Institute. He is also well known as a staunch upholder of Lady Hewley's Foundations, and of the claims upon them by the Presbyterian ministry of England, and has rendered America his debtor by pointing out the precise localities in the mother country from which the earliest families settled in New England took their origin.

HUNTER, WILLIAM, was born in 1718 at Long Calderwood, near Glasgow. He was entered at the University of Glasgow in 1732, and remained there for five years studying for the church; but while hesitating whether he should pursue that profession he met with Cullen, who was at that time practising as a surgeon and apothecary at Hamilton. An intimate friendship was soon formed between them, the result of which was that Hunter determined to study medicine, and to practise in partnership with Cullen. Part of the agreement into which they mutually entered was, that each of them should alternately pass a winter at some large medical school, while the other remained

in charge of the business in the country. The success of Cullen, and his exaltation to the highest celebrity in Scotland, has been already mentioned [CULLEN, WILLIAM], and Hunter was destined to attain a reputation scarcely inferior in England. In 1741 he visited London, where he resided with Smellie, the celebrated accoucheur, and studied anatomy under Dr. Nicholls, and surgery at St. George's Hospital. Dr. Douglas, to whom he brought a letter of introduction, engaged him soon after his arrival to assist him in completing an anatomical work which he was publishing, and to educate his son. He resided in the family till 1744, when Mr. Sharpe having resigned a lectureship on surgery to a Society of Naval Surgeons, Hunter was elected to fill his place, and at once met with the most marked success. In 1746 he commenced lecturing on anatomy, and in 1747 became a member of the Corporation of Surgeons. But he had always preferred the practice of midwifery to that of surgery; and several circumstances coinciding to give a favourable prospect of success, he determined in 1749 to confine himself exclusively to the former subject. In 1750 he took a Doctor's degree at Glasgow; in 1764 was appointed physician extraordinary to the queen; in 1767 he became a Fellow of the Royal Society. His time was now so completely occupied in the practice of his profession, that he was obliged to give up a part of his lectures, and his brother John, Hewson, and Cruickshank, were successively his partners. He amassed a large fortune, and died in 1783, with a reputation inferior only to that of his brother, of whom it was not his least honour that he had been the preceptor and first patron. They had been unhappily estranged for many years before Dr. Hunter's death, in consequence of a dispute relative to their mutual claims to the discovery of the structure of the placenta: which was most in fault is still unknown; but their hostility, which was at first very warm, did not cease till William was on his death-bed. Even then the reconciliation was only partial, for he left nearly the whole of his large property to those who were distantly connected with him, although his brother was at the time in embarrassed circumstances.

William Hunter's principal work was the 'Anatomy of the Gravid Uterus,' on which he was engaged for nearly thirty years. It contains thirty-four folio plates, most accurately and beautifully engraved from dissections by himself and his brother, illustrative of the most important subjects in obstetrics. A work descriptive of these plates, and containing several other points of great interest collated from the original manuscript, was published after Dr. Hunter's death by his nephew Dr. Baillie. He was also the author of numerous essays in the 'Philosophical Transactions,' and the 'Medical Observations,' of which the most important are those relating to his discoveries of the varicose aneurism, of the origin and use of the lymphatics, the retroversion of the uterus, and the membrana decidua reflexa. William Hunter had long wished to found an anatomical school in London, and in 1765 he offered to expend 7000*l.* on a building fit for that purpose, to endow a professorship, and to give his museum and library, if the government would grant him a piece of ground to build upon. This munificent offer was refused, and he therefore bought some ground in Windmill Street, where he built a private house, with a museum and dissecting-rooms adjacent to it. He at the same time added to his museum, which already contained a large number of very valuable anatomical and pathological preparations, a choice library of Greek and Latin works, a cabinet of the rarest ancient medals, which cost him 20,000*l.*, and numerous objects of natural history. He bequeathed all these to Dr. Baillie, who was to hold them for thirty years, and then to transmit them to the University of Glasgow, to which he had also left 8000*l.*, for their maintenance and increase.

If William Hunter was inferior in intellect to his brother John, he was free from many of his faults; he was a good scholar, a clear and elegant writer, and an accomplished gentleman. He was the most scientific man that had ever practised as an accoucheur; and midwifery is as much indebted to him as surgery is to his brother. Each not only improved the practice of his profession, but conferred a far greater benefit by introducing the scientific principles of physiology into what had, before their time, been little more than mechanical arts.

HUNTINGDON, SELINA, COUNTESS OF, a lady distinguished in the religious history of the century to which she belonged, was born in 1707, and was one of the three daughters and co-heirs of Washington Shirley, earl Ferrers, the other two being Lady Kilmoray and Lady Elizabeth Nightingale, the lady for whom there is the well-known monument in Westminster Abbey. Selina, the second daughter, married, in 1728, Theophilus Hastings, earl of Huntingdon, a nobleman of retired habits, with whom she appears to have had a very happy life till his sudden death, on the 13th of October 1746, of a fit of apoplexy. She had many children, four of whom died in youth or early manhood.

It was probably these domestic afflictions which disposed this lady to take the course so opposite to that which is generally pursued by the noble and the great. She became deeply religious. It was at the time when the preachers and founders of Methodism, Wesley and Whitefield, were rousing in the country, by their exciting ministry, a spirit of more intense devotion than was generally prevalent, and leading men to look more to what are called the distinguishing truths of the Gospel than to its moral teachings, to which the clergy had for

some time chiefly attended in their public ministrations. She found in these doctrines matter of consolation and delight, and she sought to make others participate with her in the advantages they were supposed by her to afford.

The doctrine to which she most inclined was that of Whitefield, whom she appointed her chaplain, and who adopted the tenets of Calvinism rather than the doctrine of Wesley, which was Arminian. Whitefield made no attempt to found a separate sect, but when the countess chose to assume a sort of leadership among his followers, and to act herself as the founder of a sect, those who might properly have been called Whitefieldian Methodists came to be known as 'the Countess of Huntington's Connexion.' The countess had the command of a considerable income during the forty-four years of her widowhood, and as her own personal expenses were few, and she engaged the assistance of other opulent persons, members of her own family or other persons who were wrought upon as she was, she was enabled to establish and support a college, at Trevecca in Wales, for the education of ministers; to build numerous chapels, and to assist in the support of the ministers in them. She died in 1791, and the number of her chapels at the time of her death is stated to have been sixty-four, the principal of which was that at Bath, where she herself frequently attended. She created a trust for the management of her college and chapels after her death. The college was soon after removed to Cheshunt, Herts, where it still flourishes; but her chapels have for the most part become in doctrine and practice almost identical with those of the Congregational or Independent body, the chief distinction being in the use of a portion at least of the 'Book of Common Prayer,' though where not expressly directed in the trust-deed that practice has in many instances been abandoned. In 1851 there were, according to the Census, 109 chapels belonging to the Countess of Huntington's Connexion in England and Wales.

Other ladies of the family of Hastings were distinguished for their piety and zeal. Lady Elizabeth Hastings, half-sister to her lord, died in 1739, when Methodism was first beginning to attract very much of the public attention. She made large gifts to religious objects, but she confined them to the Church, and subjected them to the general regulations of the affairs of that community. Lady Margaret, the own sister of the earl, gave herself in marriage to one of the Methodist preachers, Mr. Ingham. Lady Catherine, another sister, married a clergyman, the Rev. Granville Wheeler. Of Ferdinando Hastings, a brother of the earl, who died in 1726, at the age of twenty-seven, there is an agreeable picture of a pious and amiable person in Wilford's 'Memorials.'

HUNTINGTON, ROBERT, D.D., was born in February 1636, at Deorhyrst in Gloucestershire, where his father, of the same names, was parish clergyman. After having received the rudiments of a classical education at the free-school of Bristol, he was admitted in 1652 a portionist of Merton College, Oxford; and, having taken his Bachelor's degree in 1658, he was soon after elected to a fellowship in that college. He took his degree of Master of Arts in 1663; and, having then applied himself with great success to the study of the oriental languages, he was in 1670 appointed to the situation of chaplain to the English factory at Aleppo. This post he held for above eleven years, during which time he visited Jerusalem, Galilee, Samaria, Cyprus in 1677, and Egypt in 1680, and again in 1681, besides making an unsuccessful attempt in 1678 to reach Palmyra. He returned home in 1682, through Italy and France, and, resuming his college life, accumulated the degrees of Bachelor and Doctor in Divinity in June of the following year. In the latter part of that year he was prevailed upon with much reluctance to accept the place of provost or master of Trinity College, Dublin; but after first taking flight on the invasion of Ireland by the deposed king after the revolution, and then returning to that country for a short time, he resigned in 1691, and once more came over to England. In August 1692 he was presented by Sir Edward Turner to the rectory of Great Hallingbury, in Essex; and while there he married a sister of Sir John Powell, one of the justices of the King's Bench. He seems still however to have felt uncomfortable in what he describes in some of his printed letters as a rustic solitude, where he was banished alike from books and friends, from the living and the dead; and, although he had some years before refused the bishopric of Kilmore in Ireland, his aversion to that country gave way so far that in 1701 he consented to accept that of Raphoe. But he died there on the 2nd of September in the same year, twelve days after his consecration.

The only literary performance that Bishop Huntington published was a short paper in the 'Philosophical Transactions' (No. 161), entitled 'A Letter from Dublin concerning the Porphyry Pillars in Egypt.' The writer of his Life in the 'Biographia Britannica' states that some of his observations are printed in Ray's 'Collection of Curious Travels and Voyages,' 2 vols. 8vo, 1693; but all which that work contains is the 'Letter on the Porphyry Pillars,' which is in vol. ii., pp. 149-155. At the end of the reprint is a notice extracted from the 'Journal des Savans' (No. 25, 1692), of a letter from M. Cuper to the Abbé Nicaire, intimating that he had just heard from Aleppo "that some English gentlemen, out of curiosity going to visit the ruins of Palmyra, had found 400 marble columns, of a sort of porphyry, and also observed some temples yet entire, with tombs, monuments, Greek and Latin inscriptions," of all of which he hoped

to get copies. This would probably be the earliest information received by the English public of the successful accomplishment of the first modern journey to Palmyra, which was achieved by some gentlemen of the factory at Aleppo in 1691, and of which a full account was given in the 'Philosophical Transactions' for 1695. Ray's book may have been printed in the latter part of 1692, though not published till May 1693, on the 3rd of which month the imprimatur is dated.

Dr. Huntington is principally remembered for the numerous oriental manuscripts which he procured while in the east and brought with him to this country. Besides those which he purchased for Archbishop Marsh and Bishop Fell, he obtained between six and seven hundred for himself, which are now in the Bodleian Library, to which he first presented thirty-five of them, and then sold the rest in 1691 for the small sum of 700*l.* Huntington however missed what was the principal object of his search, the very important Syrian version of the epistles of St. Ignatius, a large portion of which was at length recovered in 1843 by Mr. Tattam from one of the very monasteries in Nitria which Huntington had visited in the course of his inquiries, and having been deposited by him in the British Museum, was published under the care of the Rev. William Cureton, keeper of the oriental manuscripts in that establishment. Several of Huntington's letters, which are addressed to the Archbishop of Mount Sinai, contain inquiries about the manuscript of St. Ignatius; and the same earnest inquiries are made in his letters to the Patriarch of Antioch.

There is a 'Life of Bishop Huntington,' in Latin, by Dr. Thomas Smith, at the end of which are thirty-nine of his letters, all in Latin, published in 8vo, at London, in 1704; and he is the subject of an article in the 'Biographia Britannica.'

HURD, RICHARD, D.D., Bishop of Worcester, was born in 1720. Bishop Hurd is eminent rather as an elegant scholar than a divine, and is more spoken of on account of his connection with Warburton than for his own merits, which were however of no mean order. He was born in Staffordshire, the son of John and Hannah Hurd, "plain, honest, and good people," as he himself has described them, renting a considerable farm in that county. It was the good fortune of Hurd to live in his childhood near a well conducted grammar-school, that of Brewood, where he had an excellent master, who prepared him well for the university. He went to Cambridge at a much earlier age than is now the custom, about fifteen; and his history from that time is that of a scholar, university man, author, and divine, taking his degrees, being ordained, gaining some little preferment, which is followed by greater, and publishing sundry sermons, tracts, and books. An ample detail of all this may be read in the sixth volume of Nichols's 'Literary Anecdotes of the Eighteenth Century.'

Dr. Hurd continued to reside at Cambridge as a Fellow of Emmanuel till 1757, when he became rector of Thurcaston in Leicestershire, where he went to reside. In 1765 he was made preacher of Lincoln's Inn, and in 1767, archdeacon of Gloucester, by his friend Bishop Warburton. In 1775 he was made bishop of Lichfield and Coventry, whence, in 1781, he was translated to Worcester, where he continued till his death, declining the offer which was made him of becoming archbishop of Canterbury on the death of Archbishop Cornwallis in 1783. He died in 1808. The writings of Bishop Hurd are too many to be particularly named. The most remarkable are his 'Dialogues,' his 'Letters on Romance and Chivalry,' his 'English Commentary on the Epistle of Horace on the Art of Poetry,' and the ingenious Essays published with it, his 'Twelve Discourses on the Prophecies,' his Sermons, and his Life of his friend Bishop Warburton. There is also an octavo volume of the correspondence between Warburton and Hurd, a very pleasing book, and calculated to remove some portion of the ill opinion which many persons have formed of the real character of Warburton, and of the nature of that friendship which so long subsisted between "Warburton and a Warburtonian."

HURDIS, JAMES, was born at Bishopstone, in Sussex, in the year 1768, and brought up at Chichester school, where he early showed a taste for poetry and music. In 1780 he entered at St. Mary Hall, Oxford, and was subsequently elected demy and fellow of Magdalen College, in that university, and took orders. In 1788 he published 'The Village Curate,' which seems to have been first produced anonymously. This work was followed by a tragedy, called 'Sir Thomas More,' and some other poetical works, as well as by two theological critiques on Genesis, and 'Remarks on the Arrangement of the Plays of Shakspeare.' In 1793 he was elected professor of poetry in the university of Oxford, and in 1801 he died.

Hurd is now remembered chiefly for his friendship with Cowper, which began about the beginning of the year 1791, and several of Cowper's letters are addressed to him. But we wish also to point attention to him as one of those who awakened or attempted to awaken interest on the subject of Shakspeare criticism, as it is most desirable that all who study Shakspeare should be made acquainted with the several steps which have been made both here and elsewhere, in the critical investigation of his writings.

* HURLSTONE, FREDERICK YEATES, president of the Society of British Artists, was born in London in 1801. Mr. Hurlstone began to exhibit at the Royal Academy about 1820, and for some ten years his name appears regularly in the catalogue; but becoming dissatisfied with the place assigned to his pictures he ceased to send his works to

the annual exhibition, and consequently cut himself off from all chance of the coveted academic distinctions. Soon after his secession from the academy Mr. Hurlstone joined the Society of British Artists, and for a long series of years his pictures have formed one of the leading features of the annual exhibition in Suffolk-street. In the movement which resulted in obtaining a charter of incorporation for that society, Mr. Hurlstone took an active part; and he has borne in the society most of the posts of responsibility and honour which it can confer. As a portrait painter Mr. Hurlstone is a disciple of the school of Sir Joshua Reynolds, and his heads possess often much of the vigour, breadth of effect, and fine colour of that great master. But Mr. Hurlstone has acquired also considerable reputation as a painter of historical and fancy subjects, his inclination leading him to select scenes of southern life, chiefly either Spanish, Moorish, and Italian peasants, or episodes from the history or poetry of those people; and they are treated with a breadth of handling and style of composition and colour which appear intended to remind the observer sometimes of Murillo and the Spanish, sometimes of one or other of the great Italian colourists. His works are not however merely imitative exercises. Mr. Hurlstone has been a frequent visitant to Spain and Italy, and if he has acquired much from the study of the works of the great masters in those countries, he has been a still more diligent student of the people, and it may fairly be presumed that much of the resemblance which his works sometimes bear to those of the old masters is due to his having followed in their steps, and studied and painted the same people under the same climate and subject to similar influences.

HUSKISSON, WILLIAM, was born March 11, 1770, at Birch Moreton Court, Worcestershire, where his father occupied an extensive farm. The family had long been settled in Staffordshire, and for several generations had been in the possession of a moderate landed estate on which they resided. On the death of his mother in 1774, his father removed into Staffordshire, married a second wife, and resided upon his patrimony until his death in 1790. He had alienated a considerable portion of his property in order to make provision for his younger children. The entailed property descended to the subject of the present notice, who cut off the entail and disposed of the landed property altogether.

In 1788, when in his fourteenth year, William Huskisson was sent to Paris, at the request of his maternal uncle, Dr. Gem, physician to the English Embassy. Dr. Gem was on terms of intimacy with Franklin and Jefferson, and the party known as the 'Encyclopædists.' William Huskisson, as was natural to a young man, became an enthusiast in the cause of the French Revolution. He was present at the taking of the Bastille in 1789, and became a member of the 'Société de 1789,' established in 1790. The object of this club was to sustain the new constitutional principles. His connection with it led to the charge which was often brought against him of having been a member of the Jacobin Club. In August 1790, he pronounced a 'Discours' at the 'Société de 1789' against the proposed creation of paper-money to a large extent, which obtained for him at the time considerable celebrity in the French capital. He withdrew from the 'Société' after the legislature had determined upon the issue of assignats. In the same year (1790) he became private secretary to Lord Gower (afterwards the Marquis of Stafford), who was then the English ambassador. A letter dated a few days after the attack on the Tuileries on the 20th of June 1792, shows that Mr. Huskisson's views respecting the Revolution had undergone a change. After the events of the 10th of August 1792, the English ambassador was recalled, and Mr. Huskisson returned with him to England. He continued to pass the greater part of his time with Lord Gower at Wimbledon, where he often met Mr. Pitt and Mr. Dundas. In January 1793, by desire of Mr. Dundas, he undertook the duties of a small office which had just been created for investigating the claims of French emigrants who were then thronging in crowds to England. Early in 1795 he was appointed under-secretary of state in the department of War and Colonies under Mr. Dundas. In this situation he soon became distinguished by his talents for business. In the 'Biographical Memoirs,' attached to the edition of his 'Speeches,' it is stated that he was often called to the private councils of Mr. Pitt. He conducted the equipment of Sir Charles (afterwards Earl) Grey's expedition to the West Indies. Towards the end of 1796 he was brought into parliament as member for Morpeth, by the Earl of Carlisle; but he does not appear as a speaker before February 1798. On the retirement of Mr. Pitt he resigned his official situation. He was unsuccessful in procuring a seat at the general election in 1802, and did not appear again in parliament until 1804, when he sat for Liskeard. Under the administration formed by Mr. Pitt in 1804, he was Secretary of the Treasury; and after the death of that minister, and during the Whig administration of 1806-7, he was an active member of the opposition. At the general election in 1806 he was re-elected for Liskeard; and after the dissolution of parliament in 1807 he sat for Harwich, and continued to do so until 1812. From this period until 1823 he represented Chichester, in which neighbourhood he had, in 1801, purchased a small estate. From 1823 until his death he represented Liverpool. On the retirement of the Whigs from office, in 1807, Mr. Huskisson resumed his former post as Secretary of the Treasury. In 1807 he was strongly invited by the Duke

of Richmond, then viceroy of Ireland, to become chief secretary; but his services could not at the time be dispensed with in the office he already filled. He resigned office in 1809, along with Mr. Canning, when the latter left the ministry on account of differences with Lord Castlereagh.

From motives of friendship and personal attachment Mr. Huskisson refused to accept any official appointment during Mr. Canning's exclusion from power; and it was not until Mr. Canning accepted the post of ambassador at Lisbon, that he again entered the public service. In August 1814 he was appointed Chief Commissioner of Woods and Forests. In 1823 he became President of the Board of Trade, and Treasurer of the Navy. His predecessor had been a cabinet minister, and Mr. Huskisson considered that his position entitled him to the same distinction, and after some delay, occasioned by the cabinet already consisting of a larger number than usual, he became one of its members. After the death of Mr. Canning, in 1827, Mr. Huskisson held the office of Secretary for the Colonies in Lord Goderich's cabinet; and he retained his post when this cabinet was broken up and the Duke of Wellington became the head of a new ministry. He had to defend himself for remaining in office after his friends in the former cabinet were excluded from power; and he did so on the ground that the measures to which he was more particularly pledged would be followed up by the then existing administration. On the 19th of May 1829, the debate on the East Retford Disfranchisement took an unexpected turn, and Mr. Huskisson was called upon to redeem a pledge which he had given in a former discussion on the question; and he accordingly voted in favour of the bill and in opposition to his colleagues. This led to his placing his resignation in the hands of the Duke of Wellington, and after some correspondence it was accepted. The resignation of Mr. Huskisson was followed by that of Lord Palmerston, Mr. Grant, and several others who had belonged to what was called 'Mr. Canning's party.' In the session of 1830 he appeared on several occasions as a formidable opponent of some of the measures of the government, and, but for his death so soon afterwards, there is every probability that he would have become a member of the Whig cabinet. His commercial principles were held by him in common with them, and in his general views he was approximating towards the Whig party. He had always been in favour of the Roman Catholic claims, and in opposing the repeal of the Corporation and Test Acts, he did so on the ground of its being a partial measure, and likely to retard Roman Catholic emancipation. He supported in May 1829, Mr. Grant's bill for relieving the Jews of their disabilities. He had left the ministry for having supported a measure of reform, and in the same session he had voted in favour of giving representatives to Manchester, Leeds, and Birmingham.

In parliament Mr. Huskisson seldom spoke except upon financial or commercial subjects. He was an active member of the Bullion Committee, and defended the principles in the Report of that committee in a pamphlet entitled 'The Question concerning the Depreciation of our Currency stated and examined,' which was published in 1810. In the debates on the corn-laws, in 1814, he supported the system of protecting agriculture by high duties, on the ground that commerce and manufactures were similarly protected, and that our whole system was one of artificial restraints. He was at that time merely for free-trade in the abstract. The question was postponed to the following year, and he supported the corn-bill of 1815, and thought that less than 80s. a quarter, a fixed duty of 15s. should be permanently charged on the importation of foreign wheat. In 1827 however he acknowledged that the policy of the corn-laws must be viewed in relation to the changes in the growth and price of corn abroad as well as at home; and he abandoned the corn-bill which had been brought in by the government, after the Duke of Wellington had carried an amendment, the effect of which would have been to prohibit the release of bonded wheat so long as the price should be less than 63s. the quarter. In 1819 he was appointed a member of the Committee of Finance. It is understood that he was principally concerned in drawing up the long Report of the Committee of Agriculture which sat in 1821. It advocated a relaxation of the corn-laws, for which he was never forgiven by the landed interest.

In 1822 Mr. Wallace and Mr. Robinson (now Earl of Ripon) had taken some preliminary steps for relaxing restrictions on commerce; and these efforts were carried on more actively and on a larger scale by Mr. Huskisson. In 1823 he carried through parliament an act for enabling the king in council to place the shipping of foreign states on the same footing with British shipping, provided that similar privileges were given to British ships in the ports of such states. He abandoned the old restrictive system of colonial trade, and, under certain regulations, threw open the commerce of the colonies to other countries. He reduced a great number of duties which had been imposed for the protection of the home produce. The shipowners, and the silk manufacturers, and a host of other interests were now in arms against him. They represented him as a cold and heartless theorist, and he was attacked very generally, both in and out of parliament, for his departure from the ancient commercial policy of the country. His speeches in parliament in defence of his measures

are his best; and his expositions of the commercial condition of the country always excited great interest. He was far from adopting in anything like their fulness the principles of free trade which have since been adopted, but he was the great pioneer of the crusade; and it must be borne in mind that even the reforms which he did effect excited great clamour and opposition, in many instances from the very parties who afterwards saw cause to advocate a far more extensive change; while the advantages of the changes he did effect were not recognised until some time afterwards. Mr. Huskisson was likewise active in procuring the repeal of the combination laws; and he relaxed the restrictions on the exportation of machinery.

At the close of the session of 1830 Mr. Huskisson left London to be present at the opening of the Liverpool and Manchester railway, on the 15th of September. When the train reached Parkside, near Newton, he got out of the carriage with many others, and had just been speaking to the Duke of Wellington, when an alarm was raised on the approach of an engine on the other line. Mr. Huskisson attempted to regain his seat, but fell to the ground at the moment the engine passed, and was dreadfully injured. He was conveyed to the house of the Rev. Mr. Blackburne, of Eccles, but the shock to the system was so great, that after enduring great agony with much fortitude and resignation, he died at nine o'clock the same evening. At the request of a large and influential portion of the mercantile classes of Liverpool his remains were interred in the new cemetery, where a handsome monument with a statue by Gibson was erected to his memory by his constituents. A second statue has since been erected in the Exchange of Liverpool, and another, also by Gibson, in Lloyd's Rooms, London.

Mr. Huskisson was married in 1799 to the youngest daughter of Admiral Milbanke, but had no family. On retiring from office in 1828 he entered upon the receipt of one of six pensions of 3000*l.* a year, which the Crown was empowered to grant for long public services. He was nominated for this pension by Lord Liverpool shortly before his political demise. He was for many years Agent for Ceylon, the salary of which was increased from 300*l.* to 1200*l.* a year: he resigned this post when appointed to the Board of Trade in 1823.

(*Speeches of the Right Hon. W. Huskisson, with a Biographical Memoir*, 3 vols. 8vo, London, 1831.)

HUSS, JOHN, was born at Hussinatz, a village of Bohemia, of humble parents, about the year 1370. He studied in the University of Prague, where he distinguished himself by his assiduity and talents. Being ordained priest in 1400, he soon after adopted the opinions of Wycliffe, which he proclaimed loudly from the pulpit, and by so doing gave offence to the Archbishop of Prague, who denounced his tenets as heretical. But Huss was confessor to Sophia, queen of Bohemia, and was favoured by King Wenceslaus himself, and thus he was able to maintain his ground for several years. In 1408 the heads of the university declared that whoever taught the opinions of Wycliffe should be expelled from that body. Huss identified his cause with that of his Bohemian countrymen, over jealous of German influence, and the consequence was that the German students withdrew from the university and the city of Prague, and repaired to Leipzig, where the elector of Saxony founded a university for them. Huss being now installed rector of the University of Prague, inculcated the doctrines of Wycliffe, whose works he caused to be translated into Bohemian. The Archbishop of Prague ordered these works to be publicly burned, and excommunicated those who still adhered to the opinions contained in them. He also suspended Huss from his sacerdotal functions, who however assembled the people, either in private houses or in the fields, where he preached against the pope, against purgatory, and above all against indulgences. The people were thus invited and encouraged to examine doctrines, which till then had been considered the sole province of the clergy; and the humblest among them, women as well as men, began to discuss the mysteries of grace, predestination, and justification. The Archbishop of Prague took the alarm, and Huss was summoned by the Pope, John XXIII., to appear in person at Bologna to answer the charges against him, which neglecting to do, he was excommunicated. Huss however had a strong party in his favour, and the consequence was that frequent tumults occurred in the streets of Prague between his partisans and those who supported the papal authority. Unwilling to appear as encouraging these disorders, Huss retired to his native village, and there both by his tongue and pen he defended the propositions of Wycliffe, rejecting at the same time all human authority in matters of faith, and exhorting the multitudes who flocked to hear him to make the Scriptures alone their rule of faith. Some time after, on the death of the archbishop Huss returned to Prague, and there publicly opposed a papal bull which had been just issued by the court of Rome against Ladislaus, king of Naples, and which invited all Christians to a crusade against him. In the University of Prague Huss stood on vantage ground, and being assisted by his clever disciple Jerome, he began to denounce the sale of indulgences in the strongest terms.

Fresh tumults took place; and after more citations from the pope which Huss declined to obey, the council of Constance at last assembled. Huss was cited to appear before the council, and he obeyed in 1414, after receiving a safe conduct from the Emperor

Sigismund. On arriving at Constance however he was arrested; his doctrines were condemned as heretical, and as he would not retract, he was publicly degraded from his priestly office, and then consigned to the civil magistrate, who by order of the emperor had him burnt. Huss died with a fortitude which was admired even by his antagonists: while the infamous conduct of the emperor has branded the name of Sigismund with an indelible stigma. (Braociolini, Poggio, 'Epiistle' to Leonardo Aretino; and *Æneas Sylvius*, 'Historia Bohemica.') The morals of Huss were irreproachable; his opinions, whether right or wrong, were conscientiously entertained; and it is but a poor excuse for the members of the council to say that they did not condemn him to death, but consigned him to the secular arm, as they were perfectly well aware of the meaning of that expression. The council thus gave a fatal example, which was followed over all Europe for centuries after, and almost to our own days. Jerome of Prague soon after met with the same fate as his master. The death of these two distinguished men created a revolt in Bohemia. The Hussites began a furious war against the Roman Catholics; they burned churches and monasteries, they overawed King Wenceslaus, and after his death his brother, the Emperor Sigismund, found himself opposed by the Hussite leader Ziska, a man of extraordinary powers, who had taken possession of Prague. Sigismund, after a great loss of men in the field, was glad to come to an accommodation upon the following terms:—1. That the church-service should be celebrated in the vulgar tongue; 2. That the communion should be administered in both kinds; 3. That clergymen should be deprived of all temporal jurisdiction; 4. That moral crimes should be punished with the same severity as violations of the criminal laws of the country. This truce however was of no long duration, and Ziska carried on the war with success against the emperor. The Hussites now divided into several branches, some very fanatical and cruel, such as the Taborites, the Horebites, and the Adamites, of whom strange but not well authenticated stories are told; and others more moderate and rational, such as the Callixtines. After the death of Ziska the warfare between the Bohemian Hussites and the Imperial troops continued until the convocation of the council of Basel, in 1431. After long and tedious conferences the council conceded to the Bohemian laity the use of the cup in the communion, and the Emperor Sigismund on his side agreed that the Hussite priests should be tolerated, even at court, that no more monasteries should be built, that the University of Prague should be reinstated in all its former privileges, and a general amnesty granted for all past disturbances. Thus peace was concluded in 1437. Bohemia however remained still in a feverish state until about a century after, when the reform of Luther revived old feelings and antipathies, of which the Thirty Years' War, which another century later desolated all Germany, may be said to have been the remote consequence.

There are a few Hussites now in Bohemia; the rest have merged into Calvinists, Lutherans, Moravians, and other sects.

HUTCHESON, FRANCIS, the reviver of speculative philosophy in Scotland, was born in Ireland, August 8th, 1694. His father was minister to a Presbyterian congregation. After completing his studies at Glasgow, Hutcheson officiated for some time in a similar capacity in the north of Ireland. In 1720 he first became known to the literary world by the publication of his 'Inquiry into the Original of our Ideas of Beauty and Virtue, &c., with an Attempt to introduce a Mathematical Calculation in Subjects of Morality,' and acquired by it the friendship of Archbishop King, author of the treatises on the 'Origin of Evil' and 'Predestination,' &c. His essay 'On the Nature and Conduct of the Passions and Affections' appeared in 1723, and in the following year he was appointed professor of moral philosophy in the University of Glasgow, where he was admitted to the degree of Doctor of Laws. He published, as manuals for his class, 'Synopsis Metaphysicæ Ontologiam et Pneumatologiam complectens,' and 'Philosophiæ Moralis institutum compendiaria Ethicæ et Jurisprudentiæ Naturalis Principia complectens.' His great work, in 2 vols. 4to, entitled 'System of Moral Philosophy,' did not appear until after his death, which took place at Glasgow in 1747. It was published by his son, Dr. F. Hutcheson, with a life of the author, by Dr. Leechman.

In his metaphysical system Hutcheson rejected the theory of innate ideas and principles, but insisted upon the admission of certain universal propositions, or, as he terms them, metaphysical axioms, which are self-evident and immutable. These axioms are primary and original, and do not derive their authority from any simpler and antecedent principle. Consequently it is idle to seek a criterion of truth, for this is none other than reason itself, or, in the words of Hutcheson, "menti congenita intelligendi vis." Of his ontological axioms two are important:—Everything exists really; and no quality, affection, or action is real, except in so far as it exists in some object or thing. From the latter proposition it follows that all abstract affirmative propositions are hypothetical, that is, they invariably suppose the existence of some object without which they cannot be true.

Truth is divided into logical, moral, and metaphysical. Logical truth is the agreement of a proposition with the object it relates to; moral truth is the harmony of the outward act with the inward sentiments; lastly, metaphysical truth is that nature of a thing wherein it is known to God as that which actually it is, or it is its absolute reality. Perfect truth is in the infinite alone. The truth of finite

things is imperfect, inasmuch as they are limited. It is however from the finite that the mind rises to the idea of absolute truth, and so forms to itself a belief that an absolute and perfect nature exists, which in regard to duration and space is infinite and eternal. The soul, as the thinking essence, is spiritual and incorporeal. Of its nature we have, it is true, but little knowledge; nevertheless its specific difference from body is at once attested by the consciousness. It is simple and active; body is composite and passive. From the spiritual nature however of the soul Hutcheson does not derive its immortality, but makes this to rest upon the goodness and wisdom of God.

In his moral philosophy Hutcheson adopted the views of Lord Shaftesbury. Accordingly his first endeavour is to show that man desires the happiness of others not less than his own, and that benevolence can no more be explained by selfishness than selfishness by benevolence. In proof of this he examines successively the several solutions of benevolence, and shows of all that they are contrary to facts. He then concludes that man desires the good of his fellows in consequence of having within him an original inclination which aspires to secure the good of others as its final cause. Benevolence therefore is primary and irreducible. There are then two classes of human affections; the one impels man to his own happiness, the other to the well-being of his fellows. But alongside of these two there exists a third, incapable of being reduced to either of them; the end it has in view is moral good, of which the idea is primary, simple, and irreducible.

In order to establish this proposition, Hutcheson successfully demonstrates that by moral good is understood neither that which pleases ourselves by gratifying our benevolent affections, nor that which is good to others, nor any conformity to the will of God, or to order, or law, or truth, nor any other idea distinct from that which the word itself expresses, and which is as simple and primary and incapable of being expressed by any other word as are taste and smell. From this simplicity and originality of the notion Hutcheson infers that the quality about which it is concerned can only be perceived by a sense, and that this sense must be special, because the quality it perceives is distinct from all others. In further confirmation of this conclusion he observes that the perception of this quality, like all other sensuous perceptions, is accompanied with pleasure, and that moral good is an end and a motive, but that the understanding is incapable of discovering any of the ends of human conduct, or of exercising any influence on the will.

Moral good then is perceived by a sense, and the perception of it or its contrary is accompanied with an agreeable or disagreeable feeling. Now this feeling being a consequent of the perception of the quality, it is impossible to resolve into it either moral good or the approbation we award to moral virtue; for this would be to resolve the cause into the effect, and the principle into the consequence. This sense Hutcheson denominates, after Shaftesbury, the moral sense. Now as the quality of which it is percipient exists only in certain mental dispositions and the acts to which these give rise, it is necessarily internal. According to Hutcheson there are several internal senses; among others the sense of beauty, whose office is to perceive the primary and irreducible quality of beauty. This character of inwardness is all that distinguishes the inner from the outer senses. Although indeed they are not of the same gross nature, they are nevertheless subject to the same laws and conditions. The moral sense therefore, as a sensuous quality, is affected by its objects immediately, and according as the sensations it experiences are agreeable or disagreeable, they are accompanied by desire or repugnance, that is, by approbation or disapprobation.

The moral sense moreover is capable of regulating all the other faculties of our nature. Whence it derives this authority Hutcheson does not attempt to show, and is content with observing that we are directly conscious of its rule.

As to the question, what are the mental dispositions which this sense approves as good and moral, he at once excludes all those whose end lies in the attainment of man's personal happiness. No action the end of which is the profit of the agent can be accounted virtuous; it may be blameless, it cannot be moral. Nevertheless the neglect of one's own interests becomes culpable whenever the advancement of them will enlarge the sphere and the means of beneficence. Benevolent dispositions and acts alone are the objects of moral approbation. Universal beneficence constitutes moral excellence, and the degrees of morality coincide with those of benevolence.

In this system the part of reason is very subordinate. Excluded from the privilege of determining the proper objects of human conduct and of acting directly on the will, it is a mere servant, whose task is to discover and to digest the proper means for the attainment of those ends which the moral sense proposes. As to the 'motive' to virtuous determinations, Hutcheson is not more explicit than Shaftesbury, but as he makes the moral sense to be something more than a simply perceptive faculty, and, like all other senses, to influence the will, it would appear that he regarded it as the moral motive also.

As a writer Hutcheson is remarkable for chasteness and simplicity of style, with great clearness of expression and happy fullness of illustration.

HUTCHINSON, JOHN, author of a mystical and cabalistic inter-

pretation of the Hebrew scriptures, was born in 1674, at Spennithorne in Yorkshire. Having received an excellent private education he became at the age of nineteen steward to Mr. Bathurst, in which capacity he afterwards served the Duke of Somerset, who bestowed upon him many marks of confidence and esteem, and when master of the horse appointed Mr. Hutchinson his riding purveyor. Availing himself of the opportunities which his situation afforded him for cultivating his favourite pursuit of mineralogy and natural history, he made a large and valuable collection of fossils, which, with his own observations, he consigned to the care of Dr. Woodward to digest and publish. This duty Woodward failed to discharge, but bequeathed the task and the collection to the University of Cambridge. In 1724, Hutchinson published the first part of a curious work entitled 'Moses's Principia,' in which he attempted to refute the doctrine of gravitation as taught in the 'Principia' of Newton. In the second part of this work, which appeared in 1727, he continued his attack upon the Newtonian philosophy, and maintained, on the authority of scripture, the existence of a plenum. From this time to his death, he published yearly one or two volumes in further elucidation of his views, which are written in a rambling and uncouth style, but evince a profound and extensive knowledge of the Hebrew scriptures. He died on the 28th of August, 1737.

According to Hutchinson, the Old Testament contains a complete system of natural history, theology, and religion. The Hebrew language was the medium of God's communication with man; it is therefore perfect, and consequently as a perfect language it must be coextensive with all the objects of knowledge, and its several terms are truly significant of the objects which they indicate, and not so many arbitrary signs to represent them. Accordingly Hutchinson, after Origen and others, laid great stress on the evidence of Hebrew etymology, and asserted that the Scriptures are not to be understood and interpreted in a literal, but in a typical sense, and according to the radical import of the Hebrew expressions. By this plan of interpretation, he maintained that the Old Testament would be found not only to testify fully to the nature and offices of Christ, but also to contain a perfect system of natural philosophy. His editors give the following compendium of the Hutchinsonian theory: "The Hebrew scriptures nowhere ascribe motion to the body of the sun, nor fixedness to the earth; they describe the created system to be a *plenum* without any *vacuum*, and reject the assistance of gravitation, attraction, or any such occult qualities, for performing the stated operations of nature, which are carried on by the mechanism of the heavens in their threefold condition of fire, light, and spirit, or air, the material agents set to work at the beginning:—the heavens thus framed by Almighty wisdom are an instituted emblem and visible substitute of Jehovah Aleim, the eternal three, the co-equal and co-adorable Trinity in Unity:—the unity of substance in the heavens points out the unity of essence, and the distinction of conditions the triune personality in Deity, without confounding the persons, or dividing the substance. And from their being made emblems they are called in Hebrew *Shemim*, the names, representatives, or substitutes, expressing by their names that they are emblems, and by their conditions or offices what it is they are emblems of." As an instance of his etymological interpretation, the word 'Berith,' which our translation renders Covenant, Hutchinson construes to signify "he or that which purifies," and so the purifier or purification 'for,' not 'with,' man. From similar etymologies he drew the conclusion "that all the rites and ceremonies of the Jewish dispensation were so many delineations of Christ, in what he was to be, to do, and to suffer, and that the early Jews knew them to be types of his actions and sufferings, and that by performing them as such were in so far Christians both in faith and practice."

A complete edition of the works of Hutchinson was published in 1748, entitled 'The Philosophical and Theological Works of the late truly learned John Hutchinson, Esq.,' 12 vols. 8vo.

Hutchinson's philological and exegetical views found numerous followers, who without constituting a doctrinal sect came to be distinguished as 'Hutchinsonians.' In their number they reckoned several distinguished divines in England and Scotland, both of the Established churches and of Dissenting communities. Among the most eminent of these were Bishop Horne and his biographer Mr. William Jones Mr. Romaine, and Mr. Julius Bates, to whom the Duke of Somerset on the nomination of Mr. Hutchinson, presented the living of Sutton in Sussex; Mr. Parkhurst, the lexicographer; Dr. Hodges, provost of Oriel; and Dr. Wetherell, Master of University College, Oxford; Mr. Holloway, author of 'Letter and Spirit;' and Mr. Lee, author of 'Sophron, or Nature's Characteristics of Truth.' The principles of Mr. Hutchinson are still entertained by many divines without their professing to be followers of Mr. Hutchinson, but the number of professing Hutchinsonians is now very small.

HUTTON, CHARLES, was born at Newcastle-upon-Tyne on the 14th of August 1737. He was descended from a family in Westmorland which had the honour of being connected by marriage with that of Sir Isaac Newton. His father, who was a superintendent of mines gave his children such education as his circumstances would permit, which did not extend beyond the ordinary branches. Charles, the youngest of the sons, manifested at an early period an extraordinary predilection for mathematical studies, and while yet at school he is said to have made considerable progress with little or no aid from his

master. Upon the death of his father, which happened before he had completed his eighteenth year, he became teacher in a school at the neighbouring village of Jeamond; and some years afterwards his master, who was a clergyman, having been presented to a living, resigned the school in his favour. In 1760 Hutton married, and removed his establishment to Newcastle, where he met with considerable encouragement. While engaged in tuition he wrote his first work, entitled 'A Practical Treatise on Arithmetic and Book-Keeping,' which appeared in 1764, and soon passed through several editions. In 1771 he published his 'Treatise on Mensuration,' 4to, London; and the same year the bridge of Newcastle having been nearly destroyed by a great flood, he drew up a paper upon the best means of securing its future stability, which was afterwards published under the title of 'Principles of Bridges, and the Mathematical Demonstration of the Laws of Arches,' 8vo, Newcastle, 1772. In 1773 he became a candidate for the professorship of mathematics at the Royal Military Academy of Woolwich. The examination was conducted with exemplary impartiality by four eminent mathematicians—Dr. Horsley, afterwards bishop of Rochester; Dr. Maskelyne, the astronomer-royal; Colonel Watson, the chief engineer to the East India Company; and Mr. Landen. After its termination the examiners expressed high approbation of all the candidates, who were eight in number, but gave a decided preference in favour of Mr. Hutton, and he was accordingly appointed to the professorship. On the 10th of November 1774 (Thomson's 'History of the Royal Society') Hutton was elected a Fellow of the Royal Society, and upon the accession of Sir John Pringle to the presidency he was appointed foreign secretary to that body, which office he continued to hold with the greatest credit until he was displaced by Sir Joseph Banks in 1778-79, on the plea that it was requisite the secretary should reside constantly in London. [BANKS, SIR JOSEPH.]

In 1775 the Royal Society instituted a series of experiments on the mountain Schellien in Perthshire, with a view to determine the mean density of the earth. These were conducted principally under the direction of Dr. Maskelyne, and when completed the labour of making the necessary calculations was allotted to Mr. Hutton, who was considered the most competent person for the undertaking. His report is contained in the 'Philosophical Transactions' of the year 1778. In the year 1779 the degree of LL.D. was conferred upon him by the University of Edinburgh. In 1781 he published his 'Tables of the Product and Powers of Numbers,' 8vo, London; and in 1785 his 'Mathematical Tables,' containing the common, hyperbolic, and logistic logarithms, with the sines, tangents, &c., both natural and logarithmic, 8vo, London. To these succeeded his 'Tracts on Mathematical and Philosophical Subjects,' 4to, London, 1786, which were reprinted in 1812, 3 vols. 8vo, London. In 1795 appeared his 'Mathematical and Philosophical Dictionary,' in two large quarto volumes, which has since supplied all subsequent works of that description with valuable information both in the sciences treated of and in scientific biography.

About this time he undertook, in conjunction with Drs. Pearson and Shaw, the arduous task of abridging the 'Philosophical Transactions.' The work was completed in 1809 in 18 vols. 4to, and Dr. Hutton is said to have received for his labour the sum of 6000*l.* In 1806 he was attacked by a pulmonary complaint, which a few years after led to his retirement from the academy, when the Board of Ordnance manifested their approbation of his long and meritorious services by granting him a pension for life of 500*l.* per annum. Dr. Hutton died on the 27th of January 1823 in the eighty-sixth year of his age, and was buried at Charlton in Kent.

Dr. Olinthus Gregory, the successor and biographer of Dr. Hutton, says in his memoir, that as a preceptor he "was characterised by mildness, kindness, promptness in discovering the difficulties which his pupils experienced, patience in labouring to remove those difficulties, unwearied perseverance, and a never-failing love of the art of communicating knowledge by oral instruction." He was equally characterised by an unassuming deportment and general simplicity of manners, by the mildness and equability of his temper, and the permanency and warmth of his personal attachments. His benevolence was great, and he was a kind friend and benefactor to the needy votary of science.

Towards the close of Dr. Hutton's life a subscription was entered into by his friends and pupils for a marble bust, which was admirably executed by Gahagan, and at his death was bequeathed to the Literary and Philosophical Society of Newcastle, where it now is.

Besides the works above mentioned, and the papers in the 'Transactions of the Royal Society,' Dr. Hutton was a constant contributor to the 'Lady's Diary,' of which periodical he was editor for many years. His remaining works consist of—'Elements of Conic Sections,' 8vo, 1787; 'A Course of Mathematics, designed for the Use of Cadets in the Royal Military Academy,' 3 vols., London, 1798-1801, of which several later editions have appeared; 'Recreations in Mathematics and Natural Philosophy, from the French of Montucla,' 4 vols. 8vo, London, 1803; and some others.

HUTTON, WILLIAM, was born at Derby, of poor parents, on the 30th of September 1723. By frugality, industry, and integrity he raised himself to opulence and eminence. It has been said of him that "in many particulars of energy, perseverance, and prudence he deserves to be called the English Franklin." At the age of seven he

was sent by his father to work in the silk-mill at Derby, which occupation he quitted at seventeen, and was bound apprentice to an uncle at Nottingham, who was a stocking-maker. He ran away during his apprenticeship, and wandered as far as Birmingham, the town in which he subsequently acquired a fortune; but distress compelled him to return to his uncle. The poor remuneration which he obtained for his labours at the stocking-frame induced him to look anxiously towards some other means of gaining a livelihood; and in 1746 he bought an old worn-down press, and taught himself the art of book-binding. In 1749 he walked to London and back to purchase a few bookbinders' tools. In the same year he commenced attending Southwell, fourteen miles distant from Nottingham, on the market-day; and there he rented a shop at twenty shillings a year, and opened it for the sale of books. In his autobiography he says: "During this rainy winter I set out at five every Saturday morning, carried a burden of from three pounds' weight to thirty, opened shop at ten, starved in it all day upon bread, cheese, and half a pint of ale, took from one to six shillings, shut up at four, and by trudging through the solitary night and the deep roads five hours more, I arrived at Nottingham by nine, where I always found a mess of milk-porridge by the fire, prepared by my valuable sister." Hutton's sister was a woman of superior mind, and he owed much to her encouragement. His object was to save a small sum to enable him to commence business in a large town; and in 1750, after having twice visited Birmingham in order to see the chances of success which the place offered, he on the third visit took the lesser half of a small shop, at a rent of one shilling per week, and furnished it with a small supply of books. The overseers teased him for two years under the idea that he would become chargeable to the parish. Five shillings a week covered all his expenses, and at the end of the first year he had saved 20*l.* Fortune continued to smile upon him, and in 1755 he married. In 1791 his property was destroyed during the Church and King Riots at Birmingham in that year, but after great difficulty he succeeded in recovering 5390*l.* from the county. He now relinquished business in favour of his son. He had filled successively all the local offices of the town. In 1781 he wrote and published his 'History of Birmingham,' and this was followed by other works in the following order: 'Journey to London,' 1784; 'The Court of Requests,' 1784; 'The Hundred Court,' 1788; 'History of Blackpool,' 1788; 'Battle of Bosworth Field,' 1789; 'History of Derby,' 1790; 'The Barbers, a Poem,' 1793; 'Edgar and Elfrida, a Poem,' 1793; 'The Roman Wall,' 1801; 'Remarks upon North Wales,' 1801; 'Tour to Scarborough,' 1803; 'Poems, chiefly Tales,' 1804; 'Trip to Coatham,' 1808.

Mr. Hutton died September 20th, 1815, a few days before the completion of his ninety-second year. In 1816 his daughter published 'The Life of William Hutton, Stationer, of Birmingham, and the History of his family: Written by Himself.' This work is one of the most entertaining and instructive pieces of autobiography in the language. An edition of this work was published in 1841, in the series of 'Knight's English Miscellanies.' This edition contains some interesting notes by Catherine Hutton, Mr. Hutton's daughter, who was then in her eighty-fifth year; and passages of a personal nature from Hutton's works are added as notes.

HUYGHENS, CHRISTIAN, son of Constantine Huyghens, possessor of Zulichem, Zelhem, &c., in Holland; whence Huyghens (Latinised Hugenius) is often called Zulichemius, though his inheritance was the second-named estate, and the initials C. H. & Z., or C. H. D. Z., often appear on the titles of his works.

For the life of Huyghens our authority is the account prefixed by S'Gravesande to the edition of his works. The éloge by Condorcet is superficial, and appears to us partial. The various historical works on mathematics may of course be consulted on points of scientific character.

Christian Huyghens was born at the Hague, on the 14th of April 1629. His father had been secretary to three princes of Orange, and was advantageously known by some Latin poems and other small works: he died in 1687, at the age of ninety. His eldest son, Constantine, succeeded him in the post of secretary, and accompanied William III. to England in that capacity in 1688. The subject of this article, his second son, from his boyhood showed an aptitude for mathematical and mechanical studies, and in 1645 he prosecuted them at the University of Leyden under the care of Schooten. In 1646-48 he studied civil law at Breda, a course being then and there established, partly under the management of his father. In 1649 he accompanied a count of Nassau to Denmark; and in 1655 he visited France. He then remained in Holland till 1660, when he went again to France, and in 1661 to England, both which voyages he repeated in 1663. In 1665 he was invited to France by Colbert, where he remained from 1666 to 1681, with the exception of two trips to Holland in 1670 and 1675 for health. This consideration prompted his final return to Holland in 1681: he was again in England in 1689, and died at the Hague on the 8th of June 1695. The preceding enumeration of changes of place is almost all that can be said of Huyghens unconnected with his philosophical fame. Condorcet informs us that the edicts against the Protestants occasioned his relinquishment of the honours and emoluments which he held in France; and that he refused to be made a special exception, we suppose to the edict incapacitating Huguenots from office. His family also, according to

Condorcet, were displeased at this step, which may have been the case, since his father was a strong partisan of the French. ('*Biog. Univ.*,' art. 'Const. Huyghens.') The same writer says it was reported at Paris that he wrote verses ('*assez mauvais*') to Ninon de L'Enclos.

The greater part of the works of Huyghens which were published during his lifetime were collected into four volumes by S'Gravesande, under the title of '*Christiani Hugenii Zulichemii dum viveret Zelemii Toparchæ, Opera Varia*,' Lugd. Bat., 1724. But Huyghens left his papers to the University of Leyden, with the request that two professors, De Volder and Fullen, would select and publish what they thought fit. The consequence was a volume entitled '*Christiani Hugenii, &c., Opuscula Posthuma*,' Amsterdam (f), 1700. But in 1728 S'Gravesande completed his edition of the works printed by Huyghens himself, and also re-published the '*Opuscula Posthuma*;' this edition, entitled '*Opera Reliqua*,' was printed at Amsterdam. To these two works, which contain almost all that Huyghens wrote, and all that he published, with the exception of papers in the '*Philosophical Transactions*' and other periodicals, we must add the mention of his correspondence, published under the following title:—'*Christ. Hugenii aliorumque Exercitationes Mathematicæ et Philosophicæ ex MSS. in Bibl. Acad., Lugd. Bat., edente P. J. Uylenbroek*,' Hag. Com., 1833, &c. Weidler also mentions a volume of posthumous works published at Leyden in 1703. We shall presently notice the several writings of Huyghens, first observing that he occupies a most conspicuous place among the immediate precursors of Newton: had it not been known that Newton was in possession of at least the main points of his system before 1674 it would undoubtedly have been fair to suppose that the researches of Huyghens gave most material suggestions to the investigator of the theory of gravitation. His writings seem to form the natural and proper step in the chain between those of Galileo and Newton.

We shall give the list of Huyghen's works in the order of subjects, with a short description of what is now memorable in each.

I. Geometrical Works.

'*Theoremata de Quadraturâ Hyperbolæ, Ellipsis, et Circuli, ex dato portione Gravitate Centro; quibus subjuncta est 'Eξέρσις Cyclometria Cl. Viri Gregorii à S. Vincentio*,' Lugd. Bat., 1651. The theorems have more merit than use: it is to be remembered that they followed the work of Guldinus. [GULDINUS.] The answer to the quadrature of the circle by Gregory of St. Vincent will be further noted in the article on that subject.

'*De Circuli Magnitudine inventâ. Accedunt ejusdem Problematum quorundam illustrium Constructiones*,' Lugd. Bat., 1651. In this work Huyghens gives some new and very close approximations to the quadrature of the circle; he was also engaged in a controversy with James Gregory on this subject, for the details of which see '*Journal des Sçavans*,' July and November 1668, and '*Phil. Trans.*,' Nos. 37 and 44. There are some minor geometrical writings of Huyghens in the '*Divers Ouvrages de Mathématique et de Physique*,' Paris, 1693.

II. Mechanical Works.

'*Horologium*,' Hag. Com., 1658, and '*Horologium Oscillatorium, sive de Motu Pendulorum et Horologia aptato Demonstrationes Geometricæ*,' Parisiis, 1673. In the first of these tracts Huyghens simply describes the application of the pendulum to the clock, of which improvement he is the inventor. The idea came to him in 1656, and the pendulum employed was the common circular one. In the second he describes the well-known but now disused apparatus by which the geometrically isochronous or cycloidal pendulum was obtained. But this is the least part of the celebrated work before us, which contains four distinct and new discoveries of first-rate importance. The first is that of the cycloid being the curve; all whose arcs measured from the lowest point are synchronous. The second is the invention of the involutions and evolution of curves, in which the proposition is established that the cycloid is its own evolute. The third is the method of finding the centre of oscillation, being the first successful solution of a dynamical problem, in which connected material points are supposed to act on one another. The fourth is the announcement (without demonstration) of those relations between the centrifugal force and velocity of a body revolving in a circle, which were afterwards proved in the '*Principia*.' It thus appears that Huyghens was in complete possession of the solution of the problem of circular motion: had his mind not been pre-occupied by the Cartesian system, it is most probable that he would have gone at least to the extent of deducing Kepler's laws from the assumption of gravitation. Demonstrations of the theorems on centrifugal force were found among his papers, and published in the '*Opera Reliqua*.' It is possible that these might have been written after he had seen the '*Principia*' of Newton.

The publication of the treatise above mentioned drew on a controversy with the Abbé Catelan, in which John Bernoulli, De L'Hôpital, and others took part.

In the '*Journal des Sçavans*,' February 1675, Huyghens described the spring pendulum, such as is now used in watches. Though there can be no doubt that this was an independent invention, yet its priority has been questioned.

Huyghens was one of the first who gave the laws of impact; the Royal Society of London had invited attention to the question, and

Huyghens, Wren, and Wallis sent solutions to the Royal Society about the same time (1669). There is an extract from his paper in the '*Phil. Trans.*' for that year; but the whole paper (perhaps enlarged) appears among the posthumous works.

The treatise '*Sur la Cause de la Pésanteur*' was first printed in French (Leyden, 1690), at the end of the '*Traité de la Lumière*.' Both are Latinised in the '*Opera Reliqua*.' There are several minor pieces on different problems of mechanics.

III. Astronomical Works.

'*De Saturni Lunâ Observatio Nova*,' Hag. Com., 1656. This is a tract of two pages printed at the end of Borelli, '*De vero Telescopii Inventore*.' It announces the discovery of a satellite to Saturn, being that which we now call the fourth. This took place on the 25th day of March 1665, and Huyghens immediately (as was then common) communicated the following cipher:—"*Admovere oculis distantia sidera nostris vvvvvvvvccerrrhmbqæ*;" which being transposed will make the following:—"*Saturno luna sua circumducitur diebus sexdecim horis quatuor*." In the present tract he explains this enigma, and adds that he is about to publish on the Saturnian system. In the meanwhile he adds another logograph to substantiate his right to another discovery; it is as follows:—"*aaaaaaccccccddeeeeghhiiiiiiiillllmmnnnnnnnnnnnoooooopprrrrstttttuuuuu*." The explanation of this dark saying was given in the '*Systema Saturnium*,' printed at the Hague in 1759. It should be remembered that Galileo's telescopes showed him nothing more as to Saturn than that it appeared to have some lateral appendages which looked like handles. In 1655, Huyghens had applied himself, in conjunction with his elder brother Constantine, to the manufacture of large telescopes. The meaning of the enigma was, *Annulo cingitur tenui, plano, nusquam coherente, ad eclipticam inclinato*; that is, he had discovered Saturn's ring. The '*Systema Saturnium*' gives an account of the discovery, fixes the position of the ring, and explains the phenomena of its appearance and disappearance, &c. This work also occasioned some controversy, now forgotten. It is worth while to take notice that Huyghens was prevented from looking for any more satellites by the notion, then not uncommon, that the whole number of satellites in the solar system could not exceed that of the planets.

The '*Cosmotheoros*' was passing through the press when Huyghens died. It was printed at the Hague in 1698, and was twice printed in English, first in 1698, and next at Glasgow in 1757; besides several translations into continental languages. It defends the Copernican system, and enters into a large number of speculations on the physical constitution and probable inhabitants of the planets.

IV. Optical Works.

These are—the '*Traité de la Lumière*,' Leyden, 1690, Latinised in the '*Opera Reliqua*,' the '*Dioptrics*,' and the '*Commentarii de Vitris Figurandis*,' both first given in the posthumous works. The first treatise was reprinted by Baron Maseras in his '*Scriptores Optici*,' London, 1823. It was written in 1678, and must now be considered as the '*Principia*' of optics. Huyghens took up the theory of undulations in opposition to that of emanation, which was adopted by Newton. By this theory he gave a sufficient explanation of the phenomena of reflexion and refraction, and also of that of double refraction, in which Newton could not succeed; that is, he gave an explanation of all the prominent phenomena of optics. The undulatory theory is now almost universally received, and Huyghens must be considered as the founder of it; for though Hooke had previously advanced the notion, yet he made no application of it to the explanation of phenomena.

It remains to mention the treatise '*De Ratiociniis in Ludo Aleæ*,' which was printed at the end of Schooten's '*Exercitationes Mathematicæ*,' Leyden, 1657. It is the earliest regular treatise on questions of chances, and first points out the manner in which the expectation of a player is determined. Some minor writings we leave unnoticed.

As a philosopher, Huyghens is distinguished by correctness, penetration, and a freshness of intellect which never left him. Before he was in possession of the formal differential calculus he was able to supply its place. His power of acquisition lasted to the end of his life. He was near sixty when he read the '*Principia*,' and past that age when he began to study the Calculus of Leibnitz. At that time of life persons seldom change old opinions, but Huyghens admitted the theory of Newton instantaneously; and he was probably the first continental philosopher who published his adhesion to the theory of gravitation, not generally, but after minute examination.

HUYSUM, JOHN VAN, born at Amsterdam in 1682, was the most eminent painter of flowers and fruit in the 18th century. His father, a picture-dealer and painter, was the instructor of his son, who at an early period resolved to devote himself entirely to that branch of the art in which he attained such unrivalled eminence. Every term of panegyric that language can furnish has been lavished, and with justice, on his productions; he seems to have dived into the mysteries of nature to represent the loveliest and most brilliant of her creations with all the magic of her own pencil. His flowers however are more beautiful and true to nature than his fruits. He is equally successful in the accessories; the drops of dew, the insects, birds' nests, with their eggs and feathers, are all painted so as almost to deceive the eye. The vases in which he puts his flowers are always from some elegant model, and the bas-reliefs are finished with the same exquisite care. He was the

first that painted flowers on a light ground. He is supposed to have possessed some secret in the mixing of his colours and preserving their lustre. His pictures sold at very high prices during his life, and are still held in the highest estimation. He died in England in 1749. Four of his pictures are in the Dulwich Gallery.

HYDE, EDWARD, EARL OF CLARENDON, the third son of Henry Hyde, of Dinton, in Wiltshire, near Salisbury, and Mary, one of the daughters and co-heiresses of Edward Langford, of Trowbridge, in the same county, was born at Dinton on the 18th of February 1608. He was first instructed by the clergyman of the parish, who was also a schoolmaster, and afterwards at Magdalen College, Oxford, where he was entered in 1621. It was his father's desire to make him a clergyman, but by the death of his two elder sons he was induced to alter his intention: the law, under these circumstances, was thought a more desirable profession; and Edward, under the auspices of his uncle Nicholas Hyde, who was treasurer of the Middle Temple, was entered as a student in that society. Three several impediments obstructed his early legal studies; the weakness of his health, the habits of his companions, and an attachment which he entertained towards the daughter of Sir George Ayliffe, of Grettenham, in Wiltshire, whom he married in 1629. The death of this lady six months after their marriage blighted the happy prospects he had enjoyed. In 1632, having been three years a widower, he was again married. His second wife was Frances, daughter of Sir Thomas Aylesbury.

After his father's death Hyde found himself in possession of such a competent fortune as to render exertion in his profession, in a pecuniary point of view, unnecessary. His studies however were not neglected: he devoted the forenoon to the business of the courts, and the evenings to taking instructions and other legal employment. It was his habit to dine, not in the Temple Hall, as most of the other students were accustomed to do, but with some of the many eminent friends whom his abilities and increasing reputation had attached to him.

In the spring of 1640 he commenced his political career: he was returned to parliament by the constituencies both of Shaftesbury and Wootton Bassett, and made his election to serve for the latter. The question of granting the supply demanded by the king formed the principal subject of discussion. Hyde argued in favour of a grant, but was successfully opposed by Hampden. The king dissolved this moderate and well-inclined parliament twenty-two days after its assembly. Hyde was named upon seven of twenty-one committees that were appointed. The borough of Saltash returned him to the Long Parliament (November 1640), and he laid aside his legal practice in order to devote himself exclusively to parliamentary business. The earl-marshal's oppressive court was abolished through his efforts; he also attacked the despotic 'Court of the North;' he was active in the condemnation of the judges' decision respecting ship-money, and took a share in the proceedings against Strafford. Up to this time he had acted with the more moderate of the popular party; but now he thought fit to detach himself from these friends. Within a week after the fall of Strafford a bill was passed for preventing the dissolution of parliament without its own authority and consent. The knowledge that this encroachment on the constitution would render the parliament more powerful than the crown probably determined him to alter his political course. A conversation with Martin and Fiennes, in which these adherents of the parliamentary party expressed strongly democratic opinions, is thought to have confirmed his determination. He now gave his support to the church, and defended the prerogative of the crown. His votes and speeches soon attracted the attention of the court; he was summoned to a private conference with the king, and received his thanks for the service he had rendered him. He daily increased in favour at court. An answer which he wrote to 'The Remonstrance' was adopted and published by the king in his own name; and so sensible was Charles of the importance of this paper, and its author's utility to his cause, that he offered to make him his solicitor-general. The office was declined, but a request that accompanied the offer of it was complied with, and Hyde consented to meet frequently with Lord Falkland and Sir John Colepepper to consult on the king's affairs, and to conduct them in parliament.

It may be thought that because the king had promised to take no step without the advice of these three counsellors, they are in a great degree responsible for his conduct; but this is not the case: Charles sometimes acted without their consent and without their knowledge on the most important occasions. For instance, in the attempt to seize the five members, his advisers were wholly ignorant of his intention, and so displeased and dejected by its perfidy and rashness, that Clarendon writes ('Hist. Reb.' vol. ii. p. 183), "They were inclined never more to take upon them the care of anything to be transacted in the house; finding already that they could not avoid being looked upon as the authors of those counsels to which they were so absolute strangers, and which they so perfectly detested."

The queen quitted England in 1642, and Charles—as it would seem against Clarendon's advice, who was for the making of moderate compliances with the popular will—left London, not again to reside there until he was a prisoner. But although Hyde was suspected of framing the king's papers and the answers which he sent to the messages of the parliament, and danger was to be apprehended in case of discovery, he continued to write them. He used more moderation than the king would have used, and indeed more than was pleasing to many Royalists.

It will be seen by comparison that his papers were drawn with an ability far superior both in argument and eloquence to that which was evinced in the manifestoes of the parliament. So necessary were his services to the king that he received a summons to repair to York, whither the king had retired (1642), as soon as he could be spared from London. He escaped from the parliament with difficulty, and reached York by circuitous and unusual routes, and continued to act as the king's adviser until the civil war broke out.

In the spring of 1643 a considerable change took place in the fortunes and condition of Hyde; instead of the secret counsellor of the king, he became his avowed and responsible servant. After he had declined the office of secretary of state, the chancellorship of the exchequer was accepted by him, and he was knighted and sworn a member of the privy council. In this disastrous year he vainly endeavoured to compromise the differences of the contending parties: neither the summons of a parliament at Oxford, nor his subsequent negotiations with the parliamentary leaders and commissioners, was of any avail to arrest the rapid decline of the royal cause. In 1645 the king thought fit to send the Prince of Wales into the west, and to name Hyde one of the councillors to attend upon and direct him. On the 5th of March he had an interview with the king, the last time that he ever saw him, and afterwards repaired to Bristol to enter on the functions which he had undertaken. Disputes and difficulties arose; the prince's army was disorganised; and his situation daily became more hazardous, on account of the many defeats which the king sustained during the autumn. In December letters were received from the king urging the prince's speedy removal either to Denmark, France, or Holland. His advisers hesitated about his departure, because there were differences of opinion as to where he should be sent: at length danger compelled his flight; and Hyde and others of his suite sailed with him, first to Seilly, and thence to Jersey, where he landed on the 16th of April 1646. After a short residence in this island, the prince, persuaded by the queen, who desired to have him in her power, joined her in France. Hyde remained in Jersey. His situation at this time was most painful; he could not return to England because of the enmity of the parliament; he even feared an attempt upon Jersey from the parliament; and impressed with a sense of imminent danger on that account, made his will, and wrote letters to be delivered to the king and the prince after his death. It might be expected that under such adverse circumstances his spirits would have failed, but constant occupation sustained them; he collected all the materials that he was able, and commenced his 'History of the Rebellion.'

After the seizure of the king his cause appeared to be desperate; there were however occasionally revulsions in his favour which spread a faint gleam of hope upon the minds of his adherents. Among these was the desertion of 17 ships of war from the parliament to the prince. This event had an influence upon the proceedings of Sir Edward Hyde, who received orders to join Prince Charles. After some fruitless travelling in quest of him, Hyde heard that he had sailed for the Thames, and procured a small vessel in order to join him. Ill-fortune awaited him; he was becalmed, and seized by several pirates from Ostend, who took him prisoner, and plundering him of all his money and goods, landed him at Ostend. In September 1648 Hyde rejoined the prince at the Hague; and there he heard of the execution of the king.

The disposition of the Spanish court towards the youthful Charles II. disposed him to send an embassy to Madrid, and Hyde and Cottington were fixed upon for the ambassadors. In May 1649 the two ambassadors left the Hague: Hyde established his wife and children at Antwerp, and after some delay landed in Spain. During fifteen months negotiations were carried on, until it became evident that none of the desired objects would result from the embassy. At length the ambassadors received the command of the king of Spain to retire, having suffered mortification from neglect, and inconvenience from excessive poverty. Hyde quitted Madrid in 1651, and lived at Antwerp with his family until the autumn, when the king returned to Paris. Here he conducted the principal business of the English court, collecting for their benefit such sums as he could procure to diminish their pecuniary embarrassments. That they were in extreme penury is evident from Hyde's correspondence. He says in 1652, "I have neither clothes nor fire to preserve me from the sharpness of the season;" and in the following year, "I have not had a livre of my own these three months." He had also other evils to contend with; the queen was his open foe, and he had enemies striving to undermine him in the favour of the king; and though the behaviour of the king was friendly, he could not avoid being vexed at his indolence and inordinate dissipation. Thus Hyde followed the fortunes of the king, affording him during his exile all the service that he was able; conducting his affairs, advising his actions, and composing the quarrels of his supporters. He was rewarded with the appointment of lord-chancellor, an empty title, as the king was then situated, powerless and poor, yet, in all respects, the utmost that could be bestowed on him.

The death of Oliver Cromwell revived the hopes of the Royalists. During the short protectorship of his son the restoration of Charles became daily more probable. "Hyde, Ormond, Colepepper, and Nicholas were at this time the four confidential counsellors by whose advice Charles was almost exclusively directed. Of these four Hyde

bore the greatest share of business, and was believed to possess the greatest influence. The measures he recommended were tempered with sagacity, prudence, and moderation." "The chancellor was a witness of the Restoration: he was with Charles at Canterbury in his progress to London, followed his triumphal entry to the capital, and took his seat on the 1st of June (1660) as speaker of the House of Lords: he also sat on the same day in the Court of Chancery." He retained the office of chancellor of the exchequer until the king could find a fit person to succeed him. Thus from a powerless and poverty-stricken guardian of an exiled king he suddenly rose to be the "first in place, favour, and authority, among the ministers of a monarch, who, while invested by the public with sovereign power, still evinced towards him the deference of a pupil."

The part that Hyde took in the principal measures that occupied the parliaments assembled after the Restoration may be learned from Lord Clarendon's 'Life,' written by himself, in Mr. Lister's 'Life of Clarendon,' and 'Burnet's 'History of his own Times.' We pass to the narration of an event of immediate personal importance and interest to the chancellor which occurred in the autumn of 1660. Anne Hyde, his daughter, who was in the household of the Princess of Orange, during a visit to the queen at Paris had contracted an attachment to the Duke of York, the result of which was a secret marriage, solemnised in September, in time to legitimatise their first child, born on the 22nd of the following month. This marriage was offensive, not only at court, but also to the chancellor, "who broke out," as he tells us, "into an immoderate passion against the wickedness of his daughter." It was at first doubtful whether this unpopular marriage might not tend to diminish the favour and power of the chancellor. These doubts however were soon removed. The king entertained no suspicions of artifice or collusion on the part of Hyde, and to prove that he entertained none, created him a baron, under the title of Lord Hyde of Hindon. On the occasion of the coronation, which took place in April 1661, the further dignity of the earldom of Clarendon was conferred on him, and he received from the king a gift of 20,000*l.*

The principal events which now took place were, the king's marriage with Catherine of Portugal, the negotiation of a loan from the King of France, and the sale of Dunkirk. Clarendon took an active part in bringing each of these events to pass: his authority and station required that in all important matters his opinions and decision should be expressed. Whatever may be thought of his share in the promotion of the king's unhappy marriage, or in the sale of Dunkirk, there can be no second opinion as to his deep culpability in sanctioning Charles in becoming a dependent borrower from the king of France.

The opposition of the chancellor to the king's inclination to Roman Catholicism, as well as to other wishes he had formed, diminished his share of royal favour, and gave opportunity to his enemies to cabal against him with a greater probability of accomplishing his overthrow, than had ever been reasonably entertained. Among these enemies was the Earl of Bristol, a bold, ambitious, intriguing man, who sought to aggrandise himself at Clarendon's expense. Bristol, who was politically embarrassed to such an extent that he could only extricate himself by some desperate effort, thinking that Clarendon might be successfully attacked, drew up articles of impeachment, and accused him of high treason, in the House of Lords. "The Lords referred the charges to the Judges; the Judges unanimously returned an answer that the charge had not been regularly and legally brought in, inasmuch as a charge of high treason cannot be originally exhibited to the House of Peers by any one peer against another; and that if the charges were admitted to be true, yet there is not any treason in them." "The Lords resolved unanimously, that they concurred with the Judges. Bristol absconded, and a proclamation was issued for his apprehension; and thus ridiculously and utterly failed this rash attempt to assail the character and power of Clarendon."

Clarendon still continued the principal conductor of the public affairs, and such was the condition of the kingdom in politics both domestic and foreign, the poverty of the exchequer, the difficulty of raising supplies, the profligacy of the court and the king's absolute neglect of business on the one hand, the relation of England to foreign powers and the Dutch war on the other, that he had difficulties of no ordinary magnitude to contend with. Discontent was general throughout the country; the war with Holland was unpopular, and the terms of peace which followed it were still more so. These feelings of irritation and disgust were vented upon Clarendon, and the public, without regard to justice, heaped upon him the odium of every measure and event.

"The war, which he had originally opposed," says Mr. Lister; "the division of the fleet, which he had not suggested; even the want of royal issue, which he could not have foreseen (the queen having lately miscarried), were all laid to his charge. Old topics of complaint were revived by the pressure of a calamity with which those topics had no connection; and in the midst of the panic and rage of the populace, at the alarming news that the Dutch were at Gravesend, they broke the windows of Clarendon's house, and painted a gibbet on his gate, accompanied with this rude rhyme,—

"Three sights to be seen:
Dunkirk, Tangiers, and a barren queen."

The vulgar belief that he had appropriated to his own use the

revenues of the state was fostered by a standing eyesore, a magnificent house that he had built, and which in derision was called Dunkirk House, Tangier Hall, and such significant nicknames. At court the king's profligate associates used all the means in their power to foster and nourish his long-conceived dislike to his principal counsellor; and by the persuasion of Lady Castlemaine, Buckingham, the chancellor's greatest enemy, was restored to office. The influence of Clarendon was successfully undermined: by the king's command he resigned the great seal on the 30th of August 1667; and in such a manner was he held up as an object for persecution, that it became evident that some proceedings would be instituted against him. The Commons, angry with him for many causes, but more especially for his recommendation of their dissolution, met in October, when a resolution was passed, "that it be referred to a committee to reduce into heads the charges against the Earl of Clarendon." Seventeen articles of impeachment were drawn up, and, after some discussion, an accusation was agreed upon and forwarded to the Lords; it was rejected however, "because the House of Commons only accused him of treason in general, and did not assign or specify any particular treason." Upon this refusal to commit, a serious contest arose between the two houses; and great excitement prevailed. To compose these animosities by withdrawing the object of contention, the friends of Clarendon advised him to quit the kingdom. After some hesitation he consented to their proposal; and on the 29th of November 1667, he sailed for Calais, leaving behind him an address written to the Lords, exculpating himself from the charges made against him, of which his flight might otherwise have been thought to be an acknowledgment. "A bill for banishing and disabling Lord Clarendon was passed by the Lords on the 12th of December, and by the Commons on the 18th. By this bill, unless he returned and surrendered himself before the 1st of February, he was to be banished for life; disabled from ever again holding any office; subjected, if he afterwards returned to England, to the penalties of high treason; and rendered incapable of pardon without the consent of the two Houses of Parliament."

The public life of Clarendon was now at an end; he was permitted somewhat reluctantly by the king of France to reside within his kingdom. At Evreux he narrowly escaped assassination at the hands of some English sailors; from Evreux he went to Bourbon, thinking to derive benefit to his health from the mineral waters; from Bourbon he removed to Montpellier; from Montpellier to Moulins, where, in the enjoyment of the society of his children, he commenced the continuation of his 'Life.' In the spring of 1674 he procured a house at Rouen, which was his last residence. Repeated attacks of gout had enfeebled his frame and constitution, and his malady continually increased: at length he expired on the 9th day of December 1674, in the sixty-fifth year of his age. His body was brought to England, and, according to the statement of Anthony Wood, was buried on the north side of Henry VII.'s chapel in Westminster Abbey. No monument has been erected, and no inscription marks the place of interment. A statue of him has however been raised in that part of the new palace at Westminster known as St. Stephen's Hall.

By his second wife, who died in 1667, at the time that difficulties were multiplying around her husband, he had six children, four sons and two daughters. Henry, the second earl of Clarendon, died in 1709; Lawrence, created earl of Rochester, died in 1711; Edward and James died unmarried; Anne married James, duke of York, and was the mother of Queen Mary and Queen Anne; Frances was married to Thomas Keightly, of Hertingfordbury.

Clarendon's abilities were great. As a minister he was wanting more in courage and firmness than in sagacity and foresight: it was his "disposition to be too much contented with temporary expedients and to be too little mindful of remote consequences." He was pure according to the standard of the times. "He had one great merit," says Mr. Lister, in his studied and careful character of this great man, "rare and valuable at all times, but peculiarly so at such a period as the Restoration. He was not disposed (except perhaps when the interests of the church were concerned) to govern in the spirit of a partisan. He aimed at appearing, not the leader of a political faction, but the minister of the nation—a minister to whom royalist and republican might equally look up for justice." His industry was remarkable, and of his oratory Pepys says (*vol. iii., p. 62*), "I am mad in love with my lord chancellor, for he do comprehend and speak out well, and with the greatest easiness and authority that I ever saw a man in my life."

As a judge there are but scanty materials for the estimation of his character: the judicial functions of a chancellor were at this time very subordinate to the political: high legal attainments were not considered essential qualifications. We do not find that he was negligent of the duties and improvement of his court.

In private life he was a warm and constant friend, and strict observer of moral duties, in an age when vice was openly countenanced and preferred. Haughtiness and irritability of temper were his principal failings. In his 'History of the Rebellion,' and in his 'Life' of himself, there are many inaccuracies. In the latter he appears to have trusted chiefly to the recollection of a somewhat fallacious memory. We must refer to Mr. Lister's 'Life of Clarendon' for an account of his writings. (*Lister, Life of Clarendon; Life of Clarendon, by himself; Burnet, Own Times; Diaries of Evelyn and Pepys.*)

HYDE, SIR NICHOLAS, was appointed chief justice of the King's Bench in 1636. He was the uncle and preceptor of the first Earl of Clarendon, whose mind he had great share in forming, by proposing daily to him legal questions for solution. He owed his promotion to the patronage of the Duke of Buckingham, who having employed him to draw his successful answer to the impeachment of the House of Commons, afterwards procured him to be appointed chief justice, when Sir Randolph Crewe was removed from that post in consequence of his lukewarmness in advancing a loan which Charles I. attempted to raise without the authority of parliament. The most important trial upon which Sir Nicholas Hyde presided after his elevation to the bench was the one in which Eliot, Hollis, and Valentine were indicted for forcibly holding down in his chair the speaker of the House of Commons, at the violent close of the parliament of 1627. The court refused to allow to the prisoners their Habeas Corpus, and inflicted fines upon them of considerable amount. This conduct (Sir Nicholas Hyde's curious apology for which may be seen in Rushworth, vol. i. p. 461) was afterwards voted by the long parliament a delay of justice. He died at his seat (Hinton Lodge), in the parish of Catherington, Hampshire, on the 26th of August 1631, aged fifty-nine. Four of his letters are extant in the Bodleian library. A beautiful full-length marble effigy of him still exists in the obscure parish church of Catherington. He was succeeded in his estate by his son,

LAWRENCE HYDE, who became principally remarkable for the personal share which he had in furthering the escape of Charles II. after the battle of Worcester. The king in his memorable wanderings was concealed for a night at the house of one of Mr. Hyde's tenants. But as this tenant was too hot-headed a royalist to be safely intrusted with the secret of his guest's quality, the king was accordingly passed off as a roundhead, and was in that character compelled to drink what must then have appeared hopeless success to the royal cause. After some difficulty Charles was withdrawn from the man's house by Lord Southampton and Mr. Hyde, and by them safely conducted the next day to Shoreham, where they succeeded in procuring a passage for him to Fécamp. The circumstances are told in detail in a manuscript written by Mr. Hyde's cousin Colonel Gounter, himself an actor in the events. This manuscript is now deposited in the British Museum, and contains the only authentic account of the escape of the king. Lawrence Hyde was M.P. for Winchester after the Restoration; he married the only daughter of Sir John Grenville, the negotiator between General Monk and Charles II. for the restoration of the king; and died in 1682.

HYDE, THOMAS, D.D., was born on the 29th of June 1636, at Billingsley, near Bridgenorth, in Yorkshire. He received his first instruction in the oriental languages from his father, and afterwards studied them under Wheelock, professor of Arabic in the University of Cambridge. He only remained at Cambridge about a year; and afterwards went, at the age of seventeen, to London to assist Walton in editing the Polyglott Bible; he transcribed for this work, in Persian letters, the Persian translation of the Pentateuch, which had previously been published at Constantinople in Hebrew characters, and also translated it into Latin; he also assisted in the correction of the Arabic and Syriac versions. In 1658 he entered Queen's College, Oxford; in 1659 was appointed under-librarian of the Bodleian Library, and in 1665 principal librarian. In 1660 he became a prebendary of Salisbury; in 1678 archdeacon of Gloucester; and in 1682 took the degree of D.D. On the death of Pococke, in 1691, Hyde was appointed Laudian professor of Arabic, and not long afterwards Regius professor of Hebrew and canon of Christchurch. He resigned the librarianship of the Bodleian in 1701, and died on the 18th of January 1703, in his sixty-eighth year. He was interpreter of oriental languages during the reigns of Charles II., James II., and William III.

Hyde possessed an accurate knowledge of almost all the Asiatic languages which were at that time accessible to European scholars. In addition to Hebrew, Syriac, Persian, Arabic, &c., he was also acquainted with the Malay and Armenian languages, and was one of the first Europeans who acquired a knowledge of Chinese, which he learned from a young Chinaman called Chinfo-coung, who had been brought to Europe by the Jesuits. His most celebrated work, entitled '*Veterum Persarum et Magorum Religionis Historia*,' Oxford, 1700, reprinted in 1760, displays an extraordinary acquaintance, considering the time in which he lived, with oriental languages and literature. Of his other works, the most important are—'*Tabulis Stellarum Fixarum ex Observatione Ulugh Beighi*,' Oxf., 1665, with a learned commentary on the different names of the stars among the Greeks and orientals; '*Quatuor Evangelia et Acta Apostolorum, Lingua Malacca caracteribus Europæis*,' Oxf., 1677; '*Epistola de Mensuris et Ponderibus Serum sive Sincensium*,' published at the end of Dr. Bernard's book '*De Mensuris et Ponderibus*,' Oxf., 1688; '*De Ludia Orientalibus*,' Oxf., 1694. All the works of Hyde, with the exception of the '*Veterum Persarum et Magorum Religionis Historia*,' were republished by Granville Sharp under the title of '*Syntagma Dissertationum quæ olim Hyde separatim edidit*,' Oxf., 1767, 2 vols. 4to. In this edition Sharp has printed several of Hyde's works which had previously been unpublished, and has also given a list of many other works which have never been published, amongst which he mentions translations in Latin of Abulfeda, Abdallatif, and the history of Tamerlane, and dictionaries of the Turkish and Persian languages.

HYDER ALI is well known as the ablest and most formidable enemy of the British power in the East Indies. He was a soldier of fortune, who began his career in the service of the Raja of Mysore in 1749, and, ascending step by step, reached in 1759 the rank of commander-in-chief of the Mysorean troops. The raja however was but a puppet; and after one or two turns of fortune, Hyder not only established himself firmly as prime minister, but pensioned off his master with three lacs of rupees yearly, and became in 1761 the undisputed ruler of Mysore. From this moment he applied diligently and successfully to the increase of his power. His encroachments led to an offensive alliance between the Mahrattas, the Nizam of the Deccan, and the Company; but he found means not only to break up this confederacy, but to engage the Nizam in war against his late friends the British in 1767. This war was carried on, little to the advantage of the English, for two years, when at last Hyder, by a bold and able stroke, placed himself in a condition to prescribe terms of peace. He drew the British troops to a considerable distance from Madras, and, availing himself of his great superiority in that arm, he put himself at the head of 6000 horse, and marching 120 miles in three days, suddenly appeared at the very gates of the capital. Fort St. George indeed might have defied his cavalry for ever, but the rich villas of the neighbourhood, the town and its mercantile wealth, lay at his mercy; and the presidency felt compelled to negotiate a peace, of which the chief conditions were a mutual restitution of conquests and an alliance in defensive wars.

This treaty was not very well kept by the British. In 1770 the Mahrattas invaded Mysore, and reduced Hyder to great difficulty. He earnestly besought assistance, but obtained nothing beyond neutrality; and in 1772 was obliged to conclude peace on disadvantageous terms. In 1774 the divisions of the Mahrattas gave him an opportunity of recovering his losses, which he diligently improved; and between that time and 1778 he had done much to restore order, improve the revenue, and increase the strength of Mysore.

In 1777-78 fresh disturbance from the Mahrattas led him again to seek help from Madras. Disgust at a second disappointment, stimulated by the influence of the French, of whom he had many in his service, and with whom, so long as they retained possessions in India, he was united by mutual jealousy of the British, with other grounds of discontent and alarm, induced him in 1779 to form a second alliance with the Nizam and the Mahrattas. Little or no preparation had been made by the Madras presidency, when in July 1780 Hyder burst with a vast army into the Carnatic. The open country was ravaged almost to the walls of Madras, and as the peasantry regarded the British as oppressors, he had always minute information as to the motions of the British troops; while they, on the other hand, found great difficulty in gaining trustworthy intelligence. During 1780 and the following year the war on the part of the British was chiefly defensive. Hyder endeavoured to avoid pitched battles, and to surprise and cut off detachments; and meanwhile he succeeded in taking several of the most important towns and fortresses. His enormous superiority in numbers and cavalry gave him the entire command of the country, which after two campaigns was so entirely wasted, that want of provisions in the autumn of 1782 reduced the army, the garrisoned places, and Madras itself, to great distress. Peace was offered by the new governor of Madras, Lord Macartney, but Hyder declined his overtures. The war therefore continued on the same footing during the following year, until in the autumn Madras was reduced to a frightful state of famine; in short, the entire ruin of the presidency seemed at hand, when the death of Hyder, in November 1782, relieved the English from a danger which his talents only had made formidable.

Hyder's son and successor, Tippoo, inherited the resentment but not the ability of his father. He found it expedient to evacuate the Carnatic in 1783, and in March 1784 concluded peace on the terms of a mutual restitution of conquests.

(Mill, *History of British India*.)

HYGINUS, CAIUS JULIUS (written also Higinus, Hygenus, Yginus, or Iginus), a freedman of Augustus Cæsar, a celebrated grammarian, and a friend of Ovid, was, according to some, a native of Spain, but according to others, a native of Alexandria. He was placed by Augustus over the library on the Palatine Hill, and also gave instruction to numerous pupils. His works, which were numerous, are frequently quoted by the ancients with great respect. The principal appear to have been:—'*De Urbibus Italicis*;' '*De Trojanis Familiis*;' '*De Claris Viris*;' '*De Proprietatibus Deorum*;' '*De Diis Penatibus*;' a Commentary on Virgil; and a treatise on agriculture.

The works mentioned above have all been lost; those which are extant, and are ascribed to Hyginus, are more probably the writings of Hyginus Garmmaticus who lived in or shortly after the reign of Trajan. These are:—1, '*Poeticon Astronomicum*,' libri iv., Ferrar, 1475; 2, '*Fabularum Liber*,' Basæ, 1535. Another collection of 234 fables is also attributed to Hyginus; 3, part of a treatise, '*De Castrametatione*,' published by Scriverius at the end of his edition of Vegetius, 1607, and by Scheel together with the treatise of Polybius 'On the Roman Camp,' Aust., 1660; 4, '*De Limitibus Constituentibus*,' edited by Rigaltius, 1618, and by Goosius in the '*Rei Agraricæ Auctores*,' 1674. Some good critics are still inclined to ascribe the '*Poeticon Astronomicum*' to Caius Julius Hyginus. The researches of Cardinal Mai have however shown that there were probably other writers of the same

name, and it is by no means clear to which of them the various works really belong.

HYNDFORD, JOHN CARMICHAEL, Third EARL OF, a Scottish nobleman of some diplomatic celebrity in the reign of George II., was born in 1701, and succeeded to the family honours in 1737. He represented, as one of the Sixteen Peers, the Scottish nobility in several parliaments, acted for two successive years (1739, 1740) as Royal Commissioner to the General Assembly of the Church of Scotland, and held the dignity of lord-lieutenant of the county of Lanark, in the upper district of which the family estates were situated. His diplomatic life began upon the occasion of the seizure of Silesia by Frederick the Great in 1741, when his lordship was deputed envoy extraordinary and plenipotentiary to the Prussian court. In this mission he succeeded in effecting an accommodation between that unscrupulous prince and the Empress-Queen Maria Theresa, by a treaty concluded the following year at Breslau. So sensible were the contracting parties of the value of his lordship's mediation and services, that by a grant from the King of Prussia, ratified subsequently at Vienna by the empress-queen, he was permitted to assume, in addition to the family armorial bearings, the Silesian eagle, with the motto "ex bene merito," and was moreover honoured by his own king with the national decoration of the order of the Thistle. At Berlin he became acquainted, through the introduction of Frederick, with the famous Baron Trenck, who gratefully acknowledges in his 'Memoirs' the "parental trouble" which his lordship took in counselling him and promoting his interests when they met some years after at Moscow. In 1744 Lord Hyndford was sent ambassador to Russia, where he became a great favourite with the Empress Elizabeth, who took an active part in behalf of Maria Theresa; and he was highly instrumental in bringing about, in 1748, the peace of Aix-la-Chapelle, which terminated what is known in history as the war of the Austrian Succession. In this mission his lordship continued till the end of 1749, and on his return was constituted a privy councillor and lord of the bed-chamber. In 1752 he was sent to the court of Vienna on his third embassy, with which, after a few months, his career as a diplomatist terminated, though he did not altogether withdraw from political life. In 1764 he received a further mark of the king's esteem in the appointment of lord vice-admiral of Scotland. After his return from Vienna his time was divided between London and the family seat at Carmichael, in the vicinity of which the memory of the 'ambassador' is still cherished with almost filial regard by the descendants of those who benefited by the munificence and public spirit which he never ceased to manifest in promoting the interests of his country. During his whole lifetime, and particularly his latter years, his attention was unremittingly devoted to his estates, which he enhanced in value by extensive improvements, and enlarged by judicious purchases and advantageous exchanges. He died in 1767, leaving no issue. His official correspondence, extending to twenty-three volumes in manuscript, is now deposited in the British Museum, to which it was secured by purchase in 1838.

HYPATIA of Alexandria was the daughter of Theon the younger, by whom she was instructed in mathematics and philosophy. Like her father, she professed the old heathen doctrines, and she was regarded as one of their most eloquent advocates. So eminent did she become in the ancient philosophy, that in the early part of the 5th century she publicly lectured on Aristotle and Plato, both at Athens and Alexandria, with immense success. At Alexandria she presided over the neo-platonic school of Plotinus, and attracted a large number of students. But it is her miserable fate, far more than her extraordinary ability, which has preserved her memory. We give the narrative of the ecclesiastical historian Socrates (from Wells's translation, 1709, of the Latin of Valerius); and his simple manner of relating, in all its enormity, a circumstance which it was so much the interest of his party to conceal, or at least to soften, might have been a lesson to his successors in the task of writing history: "There was a woman at Alexandria by name Hypatia. She was daughter to Theon the philosopher. She had arrived to so eminent a degree of learning that she excelled all the philosophers of her own times, and succeeded in that Platonic school derived from Plotinus, and expounded all the precepts of philosophy to those who would hear her. Wherefore, all persons who were studious about philosophy flocked to her from all parts. By reason of that eminent confidence and readiness of expression, wherewith she had accomplished herself by her learning, she addressed frequently even to the magistrates with a singular modesty.

Nor was she ashamed of appearing in a public assembly of men, for all persons revered and admired her for her eximious modesty. Envy armed itself against this woman at that time; for, because she had frequent conferences with Orestes [the prefect of Alexandria], for this reason a calumny was framed against her among the Christian populace, as if she hindered Orestes from coming to a reconciliation with the bishop. Certain persons therefore, of fierce and over-hot minds, who were headed by one Peter, a reader, conspired against the woman, and observed her returning home from some place; and having pulled her out of her chariot, they dragged her to the church named Cæsareum, where they stripped her and murdered her. And when they had torn her piecemeal, they carried all her members to a place called Cinaron and consumed them with fire. This fact brought no small disgrace upon Cyrillus and the Alexandrian Church."

Cyril's alleged share in this horrible murder, and some other particulars connected with it, are noticed under CYRIL. The death of Hypatia occurred in 415. Damascius (the author of the 'Life of Isidore,' in Photius) says that Hypatia was the wife of this Isidore, and that Cyril was the instigator of the murderers. Some particulars are added in Suidas (*Ἰσίδωρος*), who states that Hypatia wrote commentaries on Diophantus, and the Conics of Apollonius, and also an astronomical canon. The story of Hypatia, as will be remembered, has been made the subject of a novel by the Rev. Charles Kingsley.

HYPERIDES, or HYPERIDES, an Athenian orator, a contemporary of Demosthenes, and one of the ten from whose writings the Lexicon of Harpocration was formed. According to Arrian, Hyperides was one of the orators whom Alexander demanded of the Athenians after the destruction of Thebes; but the list which the author of the 'Life of Demosthenes' (attributed to Plutarch) gives as the most trustworthy, does not contain the name of Hyperides. He was engaged in the Læmian war, which immediately followed the death of Alexander (B. C. 323), and he spoke a funeral oration over those who fell in the battle, which was highly commended by antiquity. A considerable fragment of this oration is preserved by Stobæus. (Serm. 123.) In B. C. 322, Hyperides, with Demosthenes and others, having fled from Athens, was condemned to death, and the sentence was carried into effect by Antipater. (Arrian, 'History of Alexander's Successors,' Photius, c. 92.) These two great orators, who had been in their lifetime both friends and enemies, died in the same year. There is no extant oration of Hyperides. The critics of antiquity unite in the highest eulogiums of Hyperides as an orator. Dionysius of Halicarnassus, in his remarks on Dinarchus (c. 5, &c.), characterises his style as marked by excellences of the highest order.

HYRCANUS, JOHN, one of the Asmonæan rulers of Judæa, succeeded his father Simon in the high priesthood, B. C. 135. His father and his two elder brothers, Judas and Mattathias, were treacherously murdered at a feast by Ptolemæus the son-in-law of Simon; and it was with great difficulty that Hyrcanus, who was not with them when they were murdered, escaped to Jerusalem. During the first year of his reign (B. C. 134) Jerusalem was besieged by Antiochus Sidetes; and after a long siege Hyrcanus was obliged to submit. The walls of Jerusalem were destroyed, and a tribute imposed upon the city. Hyrcanus afterwards accompanied Antiochus in his expedition against the Parthians; but returned to Jerusalem before the defeat of the Syrian army. After the defeat and death of Antiochus, B. C. 130, Hyrcanus took several cities belonging to the Syrian kingdom, and completely established his own independence. He strengthened his power by an alliance with the Romans; and extended his dominions by the conquest of the Idumæans, whom he compelled to submit to circumcision and to observe the Mosaic law; and also by taking Samaria, which he levelled to the ground, and flooded the spot on which it had stood. The latter part of his reign was troubled by disputes between the Pharisees and Sadducees. Hyrcanus had originally belonged to the Pharisees; but had quitted their party in consequence of an insult he received at an entertainment from Eleazar, a person of importance among the Pharisees. By uniting himself to the Sadducees, Hyrcanus, notwithstanding the benefits he had conferred upon his country by his wise and vigorous government, became very unpopular with the common people, who were for the most attached to the Pharisees. Hyrcanus died B. C. 106, and was succeeded by his son Aristobulus, who was the first of the Asmonæan princes who assumed the royal title.

HYRCANUS II. [ASMONÆANS.]

HYSTASPES. [DARIUS I.]

I

IAMBlichus (IAMBlichus CHALCIDENUS), a celebrated neo-Platonist of the 4th century, was born at Chalcis in Cælo-syria, and is distinguished by his birth-place from another of the same name and of the same school and century, born at Apamea in Syria, of whom however little is known. From his admirers and disciples Iamblichus received the flattering titles of "most divine teacher" and "wonderful," and enjoyed a reputation among his contemporaries which cast

into the shade the fame of his teacher Porphyry, whom nevertheless he was far from equalling either in extent of learning or in powers of mind. The literary career of Iamblichus extends from the reign of Constantine the Great to that of Julian the Apostate, whose esteem and favour he obtained, not only on account of his general adherence to and defence of the old national religion, but particularly for his 'Life of Pythagoras.' (Iamblichus de Vita Pythagoricâ liber, Gr. et

Lat. illustratus a L. Küstero. Accedit Malchus sive Porphyrius de vita Pythag. &c. &c. Amstelodami, 1740, 4to.; the same by Kiessling, Leipzig, 1816, 2, Th. 8vo.) In this work Iamblichus ascribed to the Italian philosopher miraculous powers and acts which might rival, if not surpass, the signs and wonders on which the Christians not only founded the divine authority of their creed, but still laid claim to. ('Habenstreit, Diss. de Iamblichi Philosophi Syri Doctrina Christianam Religionem, quam imitari studet, noxia,' Leipzig, 1704, 4to.) At this period indeed the philosophemes of the East were exerting a corrupt influence not only upon Christianity, but also upon philosophy; and a belief in magic and divination, in miraculous gifts and the operation of celestial agents, was universally prevalent, and found numerous and zealous adherents, as well among heathens as among Christians. An important element in the eclectical, or rather syncretistic, system of the neo-Platonists was the Oriental dogma of emanation, according to which the souls of all creatures, after passing through certain states and periods of purification, return unto God, from whom they originally emanated, and afterwards falling away, contracted a stain and pollution. Of such a doctrine it was a consequence to believe that a life of asceticism and self-denial would enable the sage even in this life to attain to an intimate union with immaculate deity. Consistently with these views Iamblichus made the perfection of man's moral nature to consist in a state of contemplative innocency. ('De Vita Pythagoræ et Protreptico Orationes ad Philosophos,' lib. ii., Gr. et Lat., ed. Joh. Arosius Theodoretus, Franck., 1598, 4to.)

From the same source of mystical and visionary speculation Iamblichus drew his ontological system. He asserted the existence of several classes of spiritual essences, or demons, and attempted to determine the mode and occasions of their manifestation and operations, and lastly, the means by which man may subject them to himself, and employ their influence and agency in the execution of his own designs. Several legends are extant in which Iamblichus is described as actually exercising this power, and compelling the spirits to obedience. The work on the Egyptian mysteries ('De Mysteriis Ægyptiorum libri, seu Responsio ad Porphyrii Epistolam ad Anebonem Prophetam,' Gr. et Lat., præmissa ep. Porph. ad Anebonem; ed. T. H. Gale, Oxford, 1678, fol.) is an attempt to show the possibility of this intimate and actual union (*ἁπλοῦς ἕνωσις*) with the Divine being, which gives a supernatural elevation to the powers of man, which however cannot be gained by the mere cultivation of the rational powers, but by the employment of certain secret symbols and forms, which have been imparted by the gods themselves to their priests, from whom only they are to be learned. The epistle of Porphyry to Anebo the priest contains many doubts concerning the Egyptian mysteries, which Iamblichus refutes by the authority of the writings of Hermes and the philosophy of Plotinus. The genuineness of this work however seems justly doubted. (Meiner, 'Judicium de Libro qui de Myst. Ægypt. inscribitur,' in the fourth volume of the 'Commentat. Soc. Scient.,' Gött., 1782, p. 50.)

Besides the works above noticed of Iamblichus, we have the following fragments from his ten books on the Pythagorean school and doctrines:—Lib. iii., 'De Generali Mathematico Scientia,' Gr., ed. Villouin in 'Anecdott. Gr.,' t. ii. p. 188, &c., coll. Friisii; introd. in lib. iii., 'Iambl. de Gen.' &c.; Kopenh., 1790, 4to; lib. iv., 'In Nicomachi Gerasoni Arithmetica,' introd. ed. 'De Fato,' Gr. et Lat., ed. Sam. Tennulius, Arnheim, 1668, 4to; lib. vii., 'Theologumena Arithmetica,' Par., 1543, 4to, of which the treatise 'De Fato' is a portion.

(Consult *Bunapiti, Vit. Soph.*, pp. 20-32, Heidelberg, 1596-98; Buhle, *Gesch. d. Philos.*, 4er Theil; and Ritter, *History of Philosophy*, vol. iv.)

IGNATIUS, one of the earliest of the apostolic fathers, called also THEOPHILUS. Antioch was a great seat and centre of Christianity from the very earliest times. St. Paul resided there many years, and brought the Christian community into regular church order. Ignatius was one of the earliest successors to St. Paul (if not the next) in the presidency over this church, or in the office of minister, superintendent, bishop, or by whatever name the connection which the Apostles and the more eminent of the early Christians bore to the churches may be designated. His connection with the church at Antioch begun as early as 67, that is, before Jerusalem was destroyed, and while still there were innumerable persons living who remembered our Saviour and the circumstances of his life, teachings, and death. This is inferred from what is related of him, that he had been forty years connected with that church when, in 107, the emperor Trajan visited Antioch, and instituted a violent persecution against the Christians. Of course Ignatius, occupying the most prominent station, would be among the first to suffer from it. They first tried to induce him to abandon his opinions and his charge, but the old man was inflexible. The issue was that he was sent to Rome, and there put to death in a very cruel manner, being thrown to the lions in a public spectacle, on one of the great festival days of the Saturnalia, the 13th of the Kalends of January, or, according to our mode of reckoning, on the 20th of December 107, according to the received opinion, though some writers make the martyrdom of Ignatius to have occurred as late as 116. What little was left of the feeble old man was gathered by a few friends and followers, and, in the spirit which prevailed so generally in the early ages of the church, removed to Antioch, and preserved there as sacred relics. It seems scarcely to have occurred to the Reformers when they set themselves to defame and destroy the relics

of saints and other holy men enshrined in the ancient churches of Christendom, that they were abolishing one of the most valuable evidences of the reality of many facts in the early history of Christianity.

However, better remains of St. Ignatius are preserved to us: four short epistles addressed to the Romans, the Philadelphians, the Smyrnsans, and to Polycarp. There is also a relation of his martyrdom by some who were present. It is this relation from which the facts of his history are chiefly, if not wholly, drawn. An English translation of it, as also of his four epistles, may be found in Archbishop Wake's 'Genuine Epistles of the Apostolic Fathers,' London, 8vo, 1693. The best editions of the Epistles of Ignatius are that contained in Le Clerc's edition of the 'Patres Apostolici' of Cotelerius, 2 vols. fol., Amsterd., 1724; and that included with the epistles of Clement of Rome and Polycarp, by Jacobson, 2 vols. 8vo, Oxford, 1838. But see as to the authenticity of the shorter epistles, and the interpolations in all, the valuable work entitled 'The Ancient Syriac Version of the Epistles of St. Ignatius,' &c., by the Rev. William Cureton of the British Museum, 8vo, Lond., 1845.

IGNATIUS, Patriarch of Constantinople. The schism of the Greek and Roman churches, which began under Photius, who persecuted this prelate, and usurped his see [PHOTIUS], gives importance to the life of Ignatius. He was born in 799, and was the son of the Emperor Michael Curopalates, and his mother Procopia was the daughter of the Emperor Nicephorus. On the revolt of Leo the Armenian, Michael surrendered to him the throne, which he had occupied during only a year and nine months, and embraced the monastic life. His sons followed the example of their father, and the youngest, Nicetas, then aged fourteen, changed his name into that of Ignatius. The new emperor, in order not to be disturbed in the possession of power, separated the several members of the family of Michael, and caused his two sons Eustratius and Nicetas to be made eunuchs.

During the reign of the three emperors Leo, Michael II., and Theophilus, they were allowed to enjoy in tranquillity the monastic life to which they had devoted themselves. Ignatius was admitted into the order of priesthood by Basil, bishop of Paros in the Hellepont, a prelate who had suffered much persecution in opposing the Iconoclasts, and to whom Ignatius was much attached. On the death of Theophilus, the Empress Theodora was declared regent in the name of her son Michael III. Being opposed to the Iconoclasts, she banished John, the Patriarch of Constantinople, and caused Methodius to be elected in his place. Four years after, on the death of Methodius, the patriarchal dignity was bestowed upon Ignatius, who was compelled to leave his monastery, where he had acquired a high reputation for piety and talent, and to accept this perilous honour.

He had not long enjoyed this see when the possession of it was troubled by his contest with Bardas, the brother of the empress, whom he had excommunicated on account of his scandalous excesses. Bardas having obtained considerable influence over the mind of the young Emperor Michael, whose vices he flattered and encouraged, induced him to take the reins of government, and to compel his mother to withdraw to a convent, and to accept the vows. Ignatius, when summoned to lend his authority to this unfilial act, did not content himself with remonstrating against it, but gave them a stern refusal. He was in consequence banished to the Isle of Terebinthos, and deprived of his see, which he had held for eleven years; every means were afterwards employed, but without effect, to induce him to resign. Photius, a eunuch related to Bardas, and a person of considerable learning, who favoured the Iconoclasts, was by the will of the emperor, but without the consent of the church, appointed to the Patriarchate of Constantinople. The controversy of Photius with the Church of Rome, and its issue, are fully detailed in the article PHOTIUS.

In 866 Bardas was put to death; and Basil, the Macedonian, became possessed of the supreme power. One of the first acts of his reign was to banish Photius and to recall Ignatius, who was triumphantly reinstated in his patriarchal dignity on the 3rd of November 867. At his suggestion a Council was assembled at Constantinople, which ranks in the Roman church as the eighth œcumenical. It was presided over by the legate of Pope Adrian II., and in it Photius and his partisans were excommunicated, and their opinions condemned. From this time Ignatius was allowed to rule the Greek Church without opposition, and his episcopacy was adorned by many Christian virtues, and by a piety which long and severe persecution had chastened. He died on the 23rd of October 878, on which day the Greek and Roman Churches still celebrate his memory. He was buried in the church of St. Sophia; but his remains were afterwards transferred to that of St. Michael, near the Bosphorus. The details of his life are chiefly drawn from Nicetas David, who had known him personally.

IGNATIUS LOYOLA. [LOYOLA.]

IHRE, JOHAN, the most eminent of Swedish philologists, and often called the Swedish Varro, was descended from a Scottish family which originally bore the name of Eyre, and settled at Wisby, in the isle of Gothland, before the island passed from the Danes to the Swedes. He was born on the 3rd of March 1707 at Lund, where his father, Thomas Ihre, author of an excellent Latin grammar entitled 'Roma in Nucæ,' was at that time professor of theology in the university. After the

death of his father in 1720, he was brought up by the family of his mother, Brigitta Steuch, whose father became Archbishop of Upsal, and whose brother was chosen archbishop at his father's death—an event to which there is no parallel in the ecclesiastical history of Sweden, or perhaps of any other country. Young Ihre was sent by his grandfather to the University of Upsal, on quitting which at the age of twenty-three with unexampled honours, he travelled abroad for three years to complete his studies, passing most of his time at Oxford, London, and Paris. His return to Upsal was followed by his appointment in succession to the posts of under-librarian, secretary of the Academy of Sciences, professor of poetry, professor of theology, and finally Skyttian professor of polite literature and political science, the latter one of the highest positions in the university, which he held for forty years.

Ihre was remarkable for vivacity as well as learning, and this vivacity led him occasionally into serious difficulties. Some expressions in one of his disputations on the connection of natural and revealed religion gave offence to several of his colleagues, who denounced him to the government as heterodox; but the authorities merely directed that the matters in dispute should be made the subject of a public academical discussion, in which Ihre gained a complete triumph. In one of his political disputations in 1745, 'De Pona Innocentium,' he advanced the singular doctrine that, if a powerful state should demand the surrender to it of one of the subjects of a weaker state, with a threat of hostilities in case of refusal, it would be the duty of the person demanded to give himself up for the good of his country, which would, in the case of his objecting, have a right to sacrifice him for the common welfare. As at the time of the appearance of this disputation the belief was general that Russia was about to demand from the Swedish court the surrender of Count Tessin, who opposed the Russian party, it is not surprising that the count lodged a complaint against the professor, which ended in Ihre's being condemned to pay a fine of 700 dollars. This affair seems not to have diminished the esteem in which Ihre was held so much as might have been expected. It may perhaps have led him to confine his attention more exclusively afterwards to philology. The first occasion of his entering deeply into this study was singular. The queen, Ulrika Eleonora, the sister and, according to some Swedish historians, the murderess of Charles XII., had been so especially charmed with the merits of the 'Lady's Library,' a sort of 'Whole Duty of Woman,' edited by Sir Richard Steele, that she was anxious to see it in Swedish. The Archbishop of Upsal, the second Steuch, on whom she urged the task of translation, grew tired of it after getting through a few chapters, and with her permission transferred it to his nephew. Ihre, in endeavouring to render Steele's elegances into Swedish, found his native language less capable and more stubborn than he had supposed it, but succeeded in publishing a 'Frantimmers-Bibliothec' (3 vols., Stockholm, 1734-38), which was received with great approbation for the beauty of its style. The reflections on the state of the Swedish language, which his experience on this occasion induced him to make, were embodied in an 'Outline of Lectures' on the subject, which was printed in 1751. This and some other publications so raised his reputation as a critic of Swedish that, when he proposed to occupy himself in compiling a Swedish glossary, the States of the kingdom voted him in 1756 a grant of 10,000 dollars. The year 1762 was originally named as that in which the work was to be given to the public, and when the time had elapsed without its completion, the States grew so indignant that in 1766 it was seriously proposed to make the professor refund a portion of the money; but the government interposed in his favour, and finally in 1769 the volumes appeared. "With this great work," to use the language of Palmblad's 'Biographical Dictionary,' "it may be said that Swedish philology in a higher sense began—and ended." The 'Glossarium Suiogothicum' (2 vols., folio, Upsal, 1769) is indeed a mine from which most of the succeeding philological writers throughout Europe have largely drawn. It consists of an extensive alphabetical series of those Swedish words on which the author has remarks to offer, and these remarks, which are couched in classical Latin, embrace investigations as to the origin of each word, and as to its affinities in nearly all the different languages of Europe except the Slavonic, with which Ihre was unacquainted. The close connection between many branches of the Swedish and English vocabularies renders his researches nearly as available and useful to an English philologist as to a Swede. It is observable however that, unless his printers have done him wrong, his knowledge of our language was not very accurate. There is a Swedish word 'makalös,' meaning 'mateless' or 'matchless,' which Queen Christina in a strange whim caused to be inscribed in Greek characters on a medal struck at Rome, and which the antiquaries, taking the medal to be ancient, made the subject of much discussion, Kircher maintaining that the word was Coptic. Ihre, in mentioning it, compares it with two English words, which he gives thus—'makeless' and 'peerless.' In spite however of trifling blemishes, the 'Glossarium' is a vast monument of learning, judgment, and ingenuity. After its publication Ihre's reputation stood very high, and he died full of years and honours on the 1st of December 1780, soon after the publication of Lindahl and Öhrling's 'Lexicon Lapponicum,' the first dictionary of the Lappish language, to which he contributed an excellent preface, which is enlivened with flashes of humour.

Ihre was twice married, and the circumstances of his first marriage

are often related as a proof of his youthful vivacity. Walking out with a fellow-student when at the university, they saw a remarkably handsome young lady driving past in her carriage, and Ihre laid a wager that he would contrive to kiss her. The method he adopted was simply to go up and stop the carriage, and, getting on the foot-board, inform the lady of the wager he had laid, and entreat her not to make him lose it. He was a very handsome man, the lady blushed and complied, and a few years afterwards she became his wife. His second wife, whom he married in 1759, survived him, and died in 1822 at the age of ninety-four.

In addition to the works already mentioned, Ihre was the author of 453 academical disputations. Most of these were on philological subjects, and many of first-rate excellence. A series on the Mæso-Gothic version of the gospels by Ulfphilas, preserved in the so-called 'Codex Argenteus' of the library at Upsal, was republished in Germany by Büsching; and Cardinal Mai declared him to be on this subject "our greatest teacher." He was also particularly successful in elucidating the Edda. A lexicon of the Swedish 'Dialects,' which he published in 1766, is hardly considered worthy of his reputation.

IMOLA, INNOCENZIO DA, a pupil of Francia, and a distinguished painter, of the early half of the 16th century. His family name was Francucci; he was born in the latter part of the 15th century at Imola, whence his surname, but he lived chiefly at Bologna. He painted from 1506 until 1549: Vasari says he died aged fifty-six, but this is apparently an error, or he must have commenced to paint when only thirteen years of age. However, about 1506, he was placed with Francia, and, according to Vasari, he studied also with Albertinelli at Florence. In 1517 he produced what is now considered his masterpiece. It is a large picture, now in the Academy at Bologna, but formerly over the great altar of San Michele in Bosco, representing in the lower part, the Archangel Michael vanquishing Satan, Saints Peter and Benedict at the sides, and above in the clouds the Madonna and Child surrounded by angels; the whole is treated much in the second manner of Raffaele. It has been engraved by A. Marchi for the 'Pinacoteca di Bologna.' There is also a very superior work by him in the cathedral of Faenza. Da Imola's style is termed by Lanzi Raffaellesco, and it appears that several of his works have passed for the works of Raffaele, that is, for works of his second style. He was also a good fresco painter.

INA, called also INAS, and IN, king of the West Saxons, and one of the most distinguished kings of the heptarchy, was the son of Cenred, whose descent is carried up through Ceolwaid, Cutha; and Cuthwin, to Ceawlin, the third king of Wessex, the son of Cenric, and the grandson of Cerdic, the founder of the monarchy. There are some difficulties however about this account of the genealogy of Ina, on which see a note in Sir F. Palgrave's 'Rise and Progress of the English Commonwealth,' part i., p. 408. He succeeded Ceadwalla, but how is not known, in 689, in the lifetime of his father Cenred; for a collection of laws which he published in the fifth year of his reign are stated in the introductory paragraph to have been enacted with the advice of Cenred and other counsellors. These laws of Ina, which are probably in great part ratifications of older laws, are seventy-nine in number: by them, to quote the summary of Dr. Lingard, "he regulated the administration of justice, fixed the legal compensation for crimes, checked the prevalence of hereditary feuds, placed the conquered Britons under the protection of the state, and exposed and punished the frauds which might be committed in the transfer of merchandise and the cultivation of land." The first of the great military successes of Ina was achieved against the people of Kent, who, some years before his accession, had slain Mollo, the brother of Ceadwalla, but who, with their King Wihtrud, were, in 692, forced to submit to Ina, and to pay him the full *were*, or legal compensation, for the murder of Mollo, which the Saxon Chronicle states at 80,000 pounds of silver, and Malmsbury, certainly by a great exaggeration, at 30,000 marks of gold. In 710 we find Ina engaged in war with the Britons of Cornwall, under their king Gerent or Geraint (in Latin, Gerontius or Geruntius), whom he finally subdued, and even, it is said, compelled to resign his dominions. A subsequent contest with Ceolred, king of Mercia, was terminated, in 715, by the battle of Wodnesbeorhe, where however it is doubtful which side obtained the victory. The last years of Ina's reign were disturbed by the attempts of several pretenders to the throne—one of whom, called the Atheling Cynewulf or Cenulf, was slain in 721; and another of whom, called Eadbyrht, after being driven from the castle of Taunton, in which he had in the first instance fortified himself, was placed at their head by the people of Sussex, and was not finally put down till 725, after a war of more than two years' duration. In 728 Ina, on the persuasion, it is said, of his wife Ethelburga, who was a daughter of King Escwin, the predecessor of Ceadwalla, resigned his crown in the Witenagemot, and retired to Rome, where he appears to have lived for a few months in obscurity, and to have died before the expiration of the year, his own death being soon followed by that of his wife. There seems to be no truth in the story told in the History ascribed to Matthew of Westminster, that he founded an English school or college at Rome, and established for its support the tax called first Romescot, and afterwards Peter's Pence. He was however a great benefactor of the church; and the abbey of Glastonbury in particular was indebted to him for ample augmentations both of its

revenues and its privileges. He is of course a great favourite of the monkish historians; but in this instance their panegyrics seem to have been deserved by the real merits of Ina, both as a warrior and a legislator.

INCHBALD, MRS. ELIZABETH, whose maiden name was Simpson, was the daughter of a Suffolk farmer residing near Bury St. Edmunds. She was born in 1753. Prone to romantic notions, and losing her father in youth, she ran away at the age of sixteen to seek her fortune, and endeavoured to procure an engagement as an actress in London. After several adventures, she obtained a place in a country theatre, and soon married Mr. Inchbald, a respectable actor, much older than herself, with whom she lived for some years in mutual regard and comfort. Mr. and Mrs. Inchbald performed for four seasons in Edinburgh, and, after an engagement at York, went to France for a time. In 1779 Mr. Inchbald died at Leeds; and in the winter of 1780-81 Mrs. Inchbald began to play secondary parts at Covent-Garden. She continued on the stage till 1789, but always owed her favour with the public less to her merits as an actress than to the sweetness of her face and manner, and to the blameless character which she was known to maintain in private life. She had begun to write dramatic pieces several years before her retirement from the stage: the first of these, a slight afterpiece, was acted and printed in 1784; and from that time till 1805 she wrote plays in rapid succession, producing nineteen in all, one of which, 'Lovers' Vows,' is an adaptation from Kotzebue. Her dramatic genius was not of a very high class: but several of her comedies had much success, and one or two of them still keep their place on the stage. They gained for her the means not only of supporting herself with honourable economy, but of making a handsome allowance to an invalid sister, and of saving a considerable sum. Her melodramatic comedy of 'Such Things Are' gained for her more than 400*l.*: as much was produced by 'Wives as they Were and Maids as they Are;' and for 'Every One has His Fault,' the most strongly characterised of her plays, she received 700*l.* She edited, with biographical and critical remarks, 'The British Theatre,' a collection of acting plays, 25 vols., 1806-9; 'The Modern Theatre,' 10 vols., 1809; and a collection of 'Farces,' 7 vols. Mrs. Inchbald's literary talents are best exhibited by her two novels, 'A Simple Story,' first published in 1791, and 'Nature and Art,' in 1796. Both became extremely popular, and deservedly so, and have been reprinted in our time in collections of standard novels. She died on the 1st of August 1821. She had written an account of her own life, but had refused an offer of 1000*l.* for it; and, in obedience to her will, it was destroyed after her death. But her journal, kept regularly for many years, was preserved; and from it and her letters were written Mr. Boaden's 'Memoirs of Mrs. Inchbald,' 1833.

* INGEMANN, BERNHARD SEVERIN, a popular Danish poet and romance writer, was born on the 23th of May 1789, at Torkildstrup, in the island of Falster. At the age of ten he lost his father, who was the parish-priest, but means were found of sending him to the grammar school of Slagelse, and to the university of Copenhagen, where in 1812 he won a gold medal for his answer to the prize question, "In what relation do Poetry and Eloquence stand to each other?" Already in the preceding year he had published a volume of lyric poems, which achieved a sudden popularity. A poem in six cantos which followed, 'De Sorte Ridder' (The Black Knights), is a mixture of epic and allegory, and as in its great prototype 'The Faery Queen,' the allegory was thought to injure the narrative. Ingemann next turned his attention to the drama, and his name was soon placed by the public side by side with that of Oehlenschläger. His tragedies of 'Blanca' and 'Masaniello,' especially the former, were favourites on the stage, but the ill-success of 'The Shepherd of Tolosa,' which was acted only one night, appears to have disgusted the poet with the theatre, and the plays he afterwards composed were not intended for representation. Several of his dramatic works were analysed with translated extracts in Mr. Gillies's attractive series of 'Horns Danica' in 'Blackwood's Magazine.' In a tour to Germany, Switzerland, Italy, and France, which Ingemann commenced in 1818, and which he afterwards celebrated by a volume of verses, he completed at Rome a drama on the subject of Tasso. The fortunes of the Italian poet have been made the theme of some of the finest compositions in the various languages of Europe—the 'Torquato Tasso' of Goethe, Byron's 'Lament of Tasso,' the 'Dying Tasso' of Batyushkov, and the 'Tasso's Deliverance' of Ingemann. The productions of the Russian and the Dane both turn on the circumstances of Tasso's death. Not long after his return to Denmark Ingemann produced a series of romances on the mediæval history of the country, three of which have been translated into English, 'Waldemar the Victorious,' and 'King Eric and the Outlaws,' by Miss Chapman, and 'The Childhood of King Erik Menved,' by Mr. Kesson, leaving only one, 'Prince Otho of Denmark,' untranslated. The style of narrative is in imitation of Walter Scott, but the incidents are kept in subordination to historical truth. The popularity of these romances in Denmark was very great on their first appearance, probably from the subject chosen; the works themselves may more fitly be compared with those of Mr. G. P. R. James than those of Walter Scott. 'Queen Margaret,' 'Ogier the Dane,' and 'Kunnok and Naja, or the Greenlanders,' are the titles of three of the more recent poems of Ingemann.

In 1822 he was appointed professor of the Danish language and literature at the college or high-school of Sörø, a sort of Danish Eton, and twenty years afterwards, in 1842, he became the director of the same establishment. His fame, which has been for some time on the decline, would probably have stood higher had he written less. A collection of his works has been published in Danish.

INGEN-HOUSZ, JOHAN, a distinguished natural philosopher, was born at Breda in 1730. For some years he practised medicine in that city, and employed his leisure in the performance of experiments in chemistry and electricity; but at length quitting his native country he came to London, where his discoveries in those branches of science soon attracted the notice of the English philosophers, and led in 1769 to his being elected a Fellow of the Royal Society. He had the good fortune to obtain an introduction to Sir John Pringle; and this celebrated physician, immediately appreciating his merits, warmly encouraged him in the prosecution of his researches, and honoured him with his esteem and friendship. He appears also occasionally to have corresponded with Franklin on the subject of electricity, which was at that time rapidly rising in importance.

The reputation of Ingen-housz as a physician must have been great, for the Empress Maria Theresa, who had lost two of her children by the small-pox, having directed her ambassador in London to consult Sir John Pringle respecting the choice of a physician whom she might invite to her court for the purpose of inoculating the young princes and princesses of the imperial family, Sir John, then president of the Royal Society, without hesitation recommended Dr. Ingen-housz; the latter, accepting the invitation, set out, in 1772, for Vienna, where he performed the operations with complete success. The example of the sovereign was followed by the nobility of Austria, and the children of the highest families of the country were inoculated by Ingen-housz or under his immediate inspection. The empress, in testimony of her sense of his merit and attention, gave him the titles of Aulic Councillor and Imperial Physician, and accompanied these honours with the grant of a pension, which he enjoyed during the rest of his life.

During his residence on the Continent, Ingen-housz visited Italy, where he made experiments on the torpedo, France, and various parts of Germany; and at intervals continued to prosecute his researches in electricity and magnetism, and on the air produced by plants. While at Vienna the Emperor Joseph II. honoured him with especial notice, inviting him frequently to the palace, and occasionally visiting him at his own house, in order to witness the performance of his philosophical experiments. After an absence of several years, Dr. Ingen-housz returned to England, where he continued to prosecute his experiments; and an account of an electrophorus, which he had invented, is described in the 'Philosophical Transactions' for 1778. About the same time he made the discovery that plants exposed to the light while growing discharge oxygen gas from their leaves into the atmosphere; and an account of his researches relating to this subject was published in London in 1779, under the title of 'Experiments upon Vegetables, discovering the power of Purifying the Air in the Sunshine and of Injuring in the Shade,' &c. The work was translated into French by the author, and published in Paris in 1780.

In the 'Philosophical Transactions' for 1779 there is an account of an electrical machine, which about that time Dr. Ingen-housz had constructed, and which probably led to the invention of the plate electrical machine, which is generally ascribed to Ingen-housz. Dr. Ingen-housz died on the 7th of September 1799.

Dr. Ingen-housz published in English a work entitled 'New Experiments and Observations concerning Various Physical Subjects,' which was translated into French and published in Paris. He also published in French a work entitled 'Essai sur la Nourriture des Plantes,' which was translated into English and published in London in 1798.

INGHIRAMI, CAVALIER FRANCESCO, a distinguished Italian archaeologist, was born in 1772, at Volterra in Tuscany. From the completion of his education he devoted himself with unwearied diligence to the study of ancient art. He wrote several papers in the artistic and antiquarian journals, which secured him a high place among the Italian art authorities; but the work which acquired for him a European reputation was the splendid publication entitled 'Monumenti Etruschi,' of which the first part appeared in 1821, and which was finally completed, in 6 vols. 4to, in 1826. This great work was intended to comprise a complete survey of all the existing remains of ancient Etruria; and it has formed the great treasury of all subsequent writers on Etruscan antiquities and the Etruscan people. His other more important works are—'Lettere di Etrusca Erudizione,' 8vo, 1828-30; 'Galleria America,' 3 vols. 8vo, 1829-31, a work intended to illustrate the 'Iliad' and 'Odyssey' by the monuments of antiquity; 'Pittura di Vasi Fittili esibite dal Cav. F. Inghirami,' 4 vols. 4to, 1835-37, in which it was his avowed object to illustrate the mythology and the history of the ancients; and 'Storia della Toscana ed in sette Epoche distribuita,' 16 vols. 12mo, 1841-43, the last two volumes being devoted to the bibliography and index. He also wrote many memoirs and papers on particular points in archeology and history in the 'Archivo Storico Italiano,' &c. Cavalier Inghirami was for several years keeper of the Laurentine Library at Florence. He died on the 17th of May 1846.

INGLIS, SIR ROBERT HARRY, BART., many years M.P. for the University of Oxford, was the only son of Sir Hugh Inglis, Bart.,

formerly chairman of the East India Company. He was born in 1786, and received his early education at Winchester, and Christchurch, Oxford. Soon after taking his degree, he became private secretary to the late Viscount Sidmouth, and was appointed by him one of the commissioners for settling the affairs of the Carnatic. In 1824 he entered parliament as member for Dundalk, a borough at that time in the patronage of the Earl of Roden. In 1826 he was elected for Ripon, the representation of which borough he resigned in the spring of 1829, in order to contest the University of Oxford against the late Sir Robert Peel, when the latter accepted the Chiltern Hundreds on introducing the Roman Catholic Relief Bill. From that time he continued to represent the University until January 1853, when he retired from parliamentary life, and was sworn a member of the Privy Council. His public life was devoted to the cause of Church and State, upon which question he inherited the ancient opinions of Lords Sidmouth and Liverpool; he steadily opposed the Repeal of the Test and Corporation Acts, the Roman Catholic Relief and Reform Bills, and the admission of Jews into parliament, and every measure which he religiously thought would tend to unchristianise the legislature. On these points his opposition was strong and consistent, though to a certain extent characterised by partiality and prejudice. He took an active part in the management of the religious societies of the Established Church, and also of the learned societies of the metropolis. In private life he was highly respected as an amiable and accomplished gentleman. He died in Bedford Square, London, May 5, 1855.

* **INGRES, JEAN-DOMINIQUE-AUGUSTE**, an eminent French painter, was born at Montauban in August 1781. By his father he was designed for a musician, but as he grew towards manhood his taste for painting became so decided that his father at length consented to gratify his ardent longing, and after some preparatory instruction from a provincial painter, he was placed in the atelier of David. Here his progress was very rapid, and he soon came to be regarded as one of the most promising of that artist's pupils. On leaving David, he spent fifteen years at Rome and four years at Florence, before he settled in Paris. He had from an early period abandoned David's manner, though it was then at its highest popularity, and adopted a freer and less formally academic one, though in the long course of years during which he has pursued his art his style has in its turn come to be regarded as too much characterised by classicism and an antiquated preciseness of manner. It is now considerably more than half a century since M. Ingres obtained his first artistic success—winning in 1800 the second and in 1801 the first prize of the *Académie des Beaux Arts*. He has ever since steadily prosecuted his profession, and though the veteran might long since have reposed on his laurels, he has never ceased to paint, and this present year (1856) he has completed a picture of 'The Birth of the Muses presided over by Jupiter,' which contains some fifteen figures, and is said to be elaborately finished. Of course it would be impossible to give a list of even the more important productions of a painter so industrious as M. Ingres and of such long standing, and one to whose works an entire salon was appropriated at the great exposition of 1855; it may suffice therefore to say that several of his historical and classical paintings have been purchased by successive governments and now adorn the public museums of France; that he painted the ceiling of one of the apartments of the Louvre, the subject being the 'Apotheosis of Homer;' that he has painted portraits of a large number of royal and distinguished Frenchmen from Napoleon I. (his portrait of whom painted in 1808 is now in the *Hôtel des Invalides*) downward; and that he has made designs for the stained glass windows of some churches and chapels (particularly those of St. Ferdinand and Dreux) which are regarded by his countrymen as models in that department of art. A volume of 102 engravings by M. Reveil from the principal paintings of Ingres, was published at Paris in 1851, and an examination of it will give a good general idea of his style.

M. Ingres after his return to Paris was made professor in the *École des Beaux Arts*. In 1829 he was appointed to succeed Horace Vernet as director of the Academy at Rome, and his services as chief of that important institution have been highly eulogised, though, as was almost inevitable, they have not escaped severe adverse criticism; indeed it has been the lot of M. Ingres to have to sustain more persevering depreciation, as well as extravagant praise, than almost any of his eminent artistic contemporary countrymen. In 1834 M. Ingres was nominated Chevalier, and in 1845 Commander of the Legion of Honour. He was elected Member of the Institute in 1825.

INGULPHUS, the author, or pretended author of a work entitled, '*Historia Monasterii Croylandensis*' (the 'History of the Monastery of Croyland, or Crowland, in Lincolnshire'), which has been considered one of the most valuable of our ancient historical monuments. The facts of the life of Ingulphus are nearly all found in this work, and in the continuation of it by Peter of Blois. According to the account there given, Ingulphus was the son of English parents, was born in London about the year 1030, and was educated, first at Westminster, and afterwards at Oxford, where he speaks of having imbued himself especially in the study of the philosophy of Aristotle and the rhetorical books of Tully. It was apparently before he went to Oxford that he obtained the notice of Edgitha, or, as he calls her, Egitha, the queen of the Confessor, whom, he tells us, he used often to see when, being yet a boy, he went to visit his father, who lived in the palace (in regis

curia morantem). The queen, he says, when she met him, used to examine him in grammar and dispute with him in logic, and never dismissed him without some pecuniary mark of her favour or ordering him to be taken to have something in the buttery. His proper introduction to court however did not take place till some years after this. "When," he says, in another place, "I had become a young man (adulescentior), disdaining the poverty (exiguitatem) of my parents, I became every day more and more impatient to leave my paternal lares, and, affecting the palaces of kings or princes, to be invested and clothed in soft and splendid raiment." He accordingly contrived to get himself introduced to Duke William of Normandy when that prince visited the court of the Confessor in 1051, and he made himself so acceptable to William, that he took him with him on his return to the Continent, and made him his prime-minister, with unbounded power, which Ingulphus confesses that he did not exercise with much discretion. However after some years he relinquished this situation to accompany Sigfrid, duke of Mentz, on a pilgrimage to the Holy Land, which turned out a very disastrous adventure. On his return, Ingulphus became a monk in the abbey of Fontenelle, in Normandy. Here he remained till 1076, when he came over to England on the invitation of his old master, now seated on the throne of that country, and was appointed abbot of Croyland. Through the favour of the king and Archbishop Lanfranc he was enabled to be of great service to this monastery, which was indebted to him both for the re-edification of its buildings, destroyed two centuries before by the Danes, and for a great extension of its privileges and immunities. Here he resided till his death, on the 17th of December 1109. A tract on the miracles of St. Guthlac (the patron of Croyland) is attributed to Ingulphus; but the only work claiming to be his that is now extant is his History already mentioned. This production was first printed in an imperfect form in Sir Henry Savile's '*Rerum Anglicanarum Scriptores post Bedam Præcipui*,' fol., Lond., 1596, and Francof., 1601; it was printed entire, along with the continuation by Peter of Blois, in the '*Rerum Anglicanarum Scriptorum Veterum, tomus primus*,' fol., Oxon., 1684 (commonly called Felli's, or the first volume of Gale's Collection). In this last edition the work of Ingulphus, which is in some degree a history of the kingdom as well as of the monastery of Croyland, and extends from the year 664 to 1089, fills 107 pages; and the continuation, extending to 1117, twenty-five more. Scarcely any of our early histories contains so many curious incidents and notices as are found in this work; and until lately its authenticity was not suspected, though Henry Wharton ('*Origines Britannicæ*') and after him Hicks and others pointed out many passages which if the work were authentic must have been interpolations. A very formidable attack however was at length made upon its claims to be regarded as anything better than 'an historical novel,' a mere monkish invention or forgery of a later age, by Sir Francis Palgrave, in an article in the '*Quarterly Review*' for June 1826 (No. 67, pp. 289, &c.); and though other critics have not entirely adopted his trenchant denunciation, there seems to be a general disposition to acquiesce in the belief that the greater part of the Chronicle is the work of a much later writer than Ingulphus. Palgrave has placed its composition in the 13th or 14th centuries; and there seems good reason to believe that all that relates to the charters of the Abbey is at least as late as the 14th century. A translation of the Chronicle ascribed to Ingulphus, with its continuation by Peter of Blois, &c., by Mr. T. H. Riley, forms a volume of Bohn's '*Antiquarian Library*,' and in the Introduction the question of the authenticity of the Chronicle is discussed: see also Wright's *Biog. Brit. Literaria*; Anglo-Norman period; Lappenberg, &c.

INNOCENT I. succeeded Anastasius I. as Bishop of Rome in the year 482. He wrote to the Emperor Arcadius in favour of St. John Chrysostom, who had been deposed from his see and exiled from Constantinople. When Alaric marched against Rome, Innocent proceeded to Ravenna in order to induce the Emperor Honorius to make peace with him, but meantime Alaric entered Rome and plundered it. He urged more than any of his predecessors the claims of the see of Rome to a superiority over the whole Western Church, and the style of his letters in addressing bishops is remarkably imperious. He also issued a decretal against the marriage of priests. The bishops of Africa having applied to him to confirm their decrees against the Pelagians, he willingly complied with their request. He died in the year 417, and was succeeded by Zosimus. Innocent's letters and decretals have been collected and published by Constant.

INNOCENT II. **CARDINAL GREGORIO PAPI**, was elected by his party, after the death of Honorius II. in 1130, but another party elected a candidate who took the name of Anacletus II. An affray between the adherents of the two followed this double election, and Innocent was obliged to leave Rome and repair by sea to France. That kingdom as well as several Italian states acknowledged him as pope, but Roger of Sicily, the conqueror of Apulia, took part with Anacletus, who in return crowned him king of Sicily and Apulia, in 1130, at Palermo. Innocent meantime crowned the king of Germany, Lotharius, at Liege, as king of the Romans, and Lotharius in 1133 marched with troops into Italy to put an end to the schism by placing Innocent on the see of Rome, which city he entered, and was himself crowned emperor by Innocent in the Basilica of the Lateran. Anacletus however hid himself up in the castle St. Angelo, and the emperor, not being

able to dislodge him from thence, left Rome, followed by Innocent, who withdrew to Pisa, where he held a council, at which St. Bernard was present, and in which Anacletus and his partisans were excommunicated. In September 1185, Lotharius marched again into Italy with numerous troops, followed by a number of German bishops and archbishops, and after having held his court in the plains of Roncaglia, where he published a law concerning the tenure of fiefs, he fought his way in the following spring into Lower Italy, defeated Roger, and obliged him to withdraw to Sicily, took Capua, Benevento, Bari, and other towns, while Innocent entered Rome and again took possession of the Lateran. Lotharius however soon after died, and in 1188 Anacletus died also. The party of the latter, supported by Roger, elected another antipope styled Victor IV., who was soon after persuaded by St. Bernard to resign his claims, and thus restore peace to the church. Roger however continued hostile to Innocent, for which he was excommunicated in the second council of the Lateran, but Innocent, having gone as far as San Germano with a body of troops to meet Roger, was surprised and taken prisoner by him. This led to a peace, by which Innocent acknowledged Roger as king and his son as duke of Apulia. It was then that the city of Naples first acknowledged Roger as its sovereign. In 1189 Arnaldo da Brescia began to preach at Rome, but being banished from that city, he repaired to France. [ARNALDO DA BRESCIA.] The remaining years of Innocent's pontificate were disturbed by a war between the Romans and the people of Tibur, and by a revolt in Rome itself, when the people, excited perhaps by the partisans of Arnaldo, assembled on the capitol, re-established the senate, and asserted their independence. In the midst of these troubles Innocent died, in September 1143, and was succeeded by Celestine II.

INNOCENT III., CARDINAL LOTHARIUS, son of Trasimund, count of Segni and of Clarcia, of a noble family of Rome, was unanimously elected in 1198, after the death of Celestine III. He ascended the papal throne at the vigorous age of thirty-seven, possessed of very great abilities, indefatigable industry, and a firm resolve to raise the papal power, both temporal and spiritual, above all the churches, principalities, and powers of the earth; and he very nearly accomplished his purpose during the eighteen years of his pontificate. He had distinguished himself while at the universities of Paris and Bologna in the studies of philosophy, theology, and the canon law, and also by several written compositions, especially by his treatise 'De Miseria Conditionis Humanae.' The gloomy ascetic views which he took in this work of the world and of human nature show a mind filled with contempt for all worldly motives of action, and not likely to be restrained in forwarding what he considered to be his paramount duty by any of the common feelings of leniency, conciliation, or concession, which to a man in his situation must have appeared sinful weaknesses. His ambition and haughtiness were evidently not personal; he was in this respect more disinterested than his prototype, Gregory VII. His interest was totally merged in what he considered the sacred right of his see, 'universal supremacy,' and the sincerity of his conviction is shown by the steady uncompromising tenor of his conduct, and by a like uniformity of sentiments and tone throughout his writings, and especially his numerous letters. ('Innocentii III., Opera,' and his 'Epistles' and 'Decretals,' published separately by Baluze, in 2 vols. fol., Paris, 1682, with a fairly written biography of Innocent by an anonymous contemporary.)

External circumstances favoured Innocent's views. The Emperor Henry VI., king of Italy, and also of Sicily, had lately died, and rival candidates were disputing for the crown of Germany; whilst Constance of Sicily, Henry's widow, was left regent of Sicily and Apulia in the name of her infant son Frederick II. Innocent, asserting his claim of suzerainty over the kingdom of Sicily, confirmed the regency to Constance, but at the same time obtained from her a surrender of all disputed points concerning the pontifical pretensions over those fine territories. Constance dying shortly after, Innocent himself assumed the regency during Frederick's minority.

At Rome, availing himself of the vacancy of the imperial throne, he bestowed the investiture on the prefect of Rome, whom he made to swear allegiance to himself, thus putting an end to the former though often eluded claim of the imperial authority over that city. In like manner, being favoured by the people, ever jealous of the dominion of foreigners, he drove away the imperial feudatories, such as Conrad duke of Spoleti and count of Assisi, and Marquandus marquis of Ancona, and took possession of those provinces in the name of the Roman see. He likewise claimed the exarchate of Ravenna; but the archbishop of that city asserted his own prior rights, and Innocent, says the anonymous biographer, "prudently deferred the enforcement of his claims to a more fitting opportunity." The towns of Tuscan, with the exception of Pisa, threw off their allegiance to the empire, and formed a league with Innocent for their mutual support. It was on this occasion that Innocent wrote that famous letter, in which he asserts that "as God created two luminaries, one superior for the day, and the other inferior for the night, which last owes its splendour entirely to the first, so he has disposed that the regal dignity should be but a reflection of the splendour of the papal authority, and entirely subordinate to it."

In Germany, Innocent, acting as supreme arbitrator between the rival aspirants to the imperial crown, decided at first in favour of

Otho, a Welf, on condition of his giving up to the Roman see the disputed succession of the Countess Mathilda; but some time after he agreed to an arrangement between Otho and his rival Philip, whom he acknowledged as emperor. Philip being murdered in 1208, Otho resumed his claims, and was crowned by the pope at Rome; but having displeased Innocent in the business of the Countess Mathilda's succession, the pope quarrelled with him; and Otho having invaded part of Apulia and of the papal territory, Innocent excommunicated and deposed him, and proposed to the electors in his place his own ward Frederick of Sicily, who repaired to Germany, and after a gallant struggle obtained the crown shortly before the death of his late guardian the pope.

Innocent, at the beginning of his pontificate, wrote a long epistle (209 of B. 11) to the Patriarch of Constantinople, and other letters to the Emperor Alexius, with the view of inducing the former to acknowledge the supremacy of the see of Rome; and although he failed in this, he had soon after, by an unexpected turn of events, the satisfaction of consecrating a prelate of the Western Church as patriarch of Constantinople.

The Crusaders, whom Innocent had sent forth, as he thought, for the re-conquest of the Holy Land, after taking Zara from the King of Hungary, for which they were severely censured by the pope, proceeded to attack Constantinople, and overthrew the Greek empire. [BALDWIN I., Emperor.] All this was done without Innocent's sanction; but when Baldwin wrote to him acquainting him with the full success of the expedition, Innocent, in his answer to the Marquis of Montserrat, forgave the Crusaders in consideration of their having brought about the triumph of the holy church over the Eastern empire. Innocent sent also legates to Calo Johannes, prince of the Bulgarians, who acknowledged his allegiance to the Roman see. ('Innocentii III., Epistolae.')

Leo, king of Armenia, received likewise Innocent's legates, who bestowed upon him the investiture of his kingdom. Innocent also excommunicated Svercum, who had usurped the kingdom of Norway.

Innocent was very strict and uncompromising in his notions of morality and discipline. He repressed venality and irregularity wherever he discovered them. He excommunicated Philippe Auguste of France because he had repudiated his wife Ingerburga of Denmark and had married Agnès de Meranis, and after a long controversy the pope obliged the king to dismiss Agnès and to take Ingerburga back. The King of Leon, having married his cousin, the daughter of the King of Portugal, was likewise excommunicated; and as he would not submit, and was supported in his resolution by his father-in-law, Innocent, by means of his legates, laid both kingdoms under an interdict.

John of England having appointed John de Gray, bishop of Norwich, to the vacant see of Canterbury, Innocent would not approve of him, and bestowed the canonical investiture upon Stephen Langton, and the monks of Canterbury would receive no other archbishop. In a fit of rage John drove away the monks and seized their property, for which the whole kingdom was laid under an interdict; and as John continued refractory, the pope pronounced his deposition, released his vassals from their oath of allegiance, and called upon all Christian princes and barons to invade England and dethrone the impious tyrant, promising them the remission of their sins. The consequent preparation of Philippe Auguste to carry out the pope's invitation, and John's dastardly submission, will be found related at length under JOHN. The king, as will be remembered, not only agreed to submit to the pope's will in all things for which he had been excommunicated, and pay damages to the banished clergy, but took an oath of fealty to the pope, and at the same time delivered to the papal envoy a charter testifying that he surrendered to Pope Innocent and his successors for ever the kingdom of England and lordship of Ireland, to be held as fiefs of the Holy See by John and his successors, on condition of their paying an annual tribute of 700 marks of silver for England and 300 for Ireland. Pandulph, the papal legate, then undertook to forbid Philippe of France attempting anything against a faithful vassal of the Church.

Against those who separated themselves from the body of the Roman Church, Innocent was stern and uncompromising. He considered heresy as the deadliest of sins, and its extirpation as the first of his duties. He sent two legates, with the title of inquirers, to extirpate heresy in France. One of them, Castelnau, having become odious by his severities, was murdered near Toulouse, upon which Innocent prescribed a crusade against the Albigenses, excommunicated Raymond count of Toulouse for abetting them, and bestowed his domains on Simon count of Montfort. He addressed himself to all the faithful, exhorting them "to fight strenuously against the ministers of the old serpent," and promising them the kingdom of Heaven in reward. He sent two legates to attend the crusade, and their letters or reports to him are contained in the collection of his 'Epistles,' especially 'Epistola 103 of B. xii.,' in which the legate Arnaldus relates the taking of Beziers and the massacre of 30,000 individuals of every age, sex, and condition. Innocent however did not live to see the end of the conflagration he had kindled. He held a general council at the Lateran in 1215, in which he inculcated the necessity of a new crusade, launched fresh anathemas against heretics, determined several points of doctrine and discipline, especially concerning the

auricular confession, and sanctioned the establishment of the two great mendicant monastic orders, the Dominicans and Franciscans, the former to extirpate heresy, and the latter to preach sound doctrines and to assist the parochial clergy in the execution of their duties. In the same year he caused his legate in Germany to crown Frederick II. at Aix-la-Chapelle. In the following year Innocent fell ill at Perugia, and died in the month of July, at the early age of fifty-six. He was an extraordinary character, and in several respects the most illustrious, as he was certainly one of the most ambitious, among the many distinguished men who have filled the papal chair. His pontificate must be considered as the period of the highest power of the Roman See.

INNOCENT IV., SINIBALDO DE' FIESCHI, of Genoa, succeeded Celestino IV. in the year 1243. In the preceding bitter quarrels between Gregory IX. and the Emperor Frederick II., Cardinal Sinibaldo had shown himself rather friendly towards the emperor; and the Imperial courtiers, on receiving the news of his exaltation, were rejoicing at it; but the experienced Frederick checked them by remarking: "I have now lost a friendly cardinal, to find another hostile pope. No pope can be a Ghibeline." Anxious however to be relieved from excommunication, Frederick made advances to the new pope, and offered conditions advantageous to the Roman see; but Innocent remained inflexible, and suddenly leaving Rome, embarked for Genoa, whence he went to Lyon, where he summoned a council in 1245, to which he invited the emperor. Thaddeus of Sessa appeared before the council to answer to the charges brought by the pope against Frederick; and after much wrangling, Innocent would listen to no terms, but excommunicated and deposed the emperor, commanded the German princes to elect a new emperor, and reserved the disposal of the kingdom of Sicily to himself. In Italy the only consequence was that the war which already raged between the Guelphs and Ghibelins continued fiercer than before; but in Germany some of the electors raised a contemptible rival to Frederick in the person of Henry, landgrave of Thuringia, who was defeated by Conrad, Frederick's son. At last Frederick died in Apulia, A.D. 1250; and Innocent, having returned to Italy, began to offer the crown of Sicily to several princes, one of whom, Richard of Cornwall, observed that the pope's offer "was much like making him a present of the moon." The pope at the same time excommunicated Conrad, the son of Frederick, who however went into Italy in 1252, took possession of Apulia and Sicily; and he dying two years after, his brother Manfred became regent, and baffled both the intrigues and the open attacks of the court of Rome. Innocent died soon after, at the end of 1254, at Rome, leaving Italy and Germany in the greatest confusion in consequence of his outrageous tyranny, and his unbending hostility to the whole house of Swabia. He was succeeded by Alexander IV. (Raumer, *Geschichte der Hohenstaufen*, and the numerous historians of the popes.)

INNOCENT V., PETER OF TARANTASIA, succeeded Gregory X. in 1276, and died the same year, after a pontificate of five months.

INNOCENT VI., ETIENNE D'ALBERT, a Frenchman, succeeded Clement VI. in 1352. He resided at Avignon, like his immediate predecessors; but, unlike them, he put a check on the disorders and scandals of that court, which have been so strongly deplored by Petrarch, Villani, and other contemporary writers. He reformed the abuses of the reservations of benefices, and he enforced the residence of bishops on their sees. He sent to Italy as his legate Cardinal Alborno, who, by skill as well as force, reduced the various provinces of the papal state, which had been occupied by petty tyrants. He sent back to Rome the former demagogue Cola di Rienzo, who, being still dear to the people, repressed the insolence of the lawless barons; but becoming himself intoxicated with his power, committed acts of wanton cruelty, upon which the people rose and murdered him in 1354. In 1355 the Emperor Charles IV. was crowned at Rome by a legate deputed by Pope Innocent for the purpose. Innocent died at Avignon, at an advanced age, in 1362.

INNOCENT VII., CARDINAL COMO DE' MIGLIORATI, of Sulmona, was elected at Rome, after the death of Boniface IX., in 1403. This was the period of what is called "the Great Western Schism," when there were two and sometimes three rival popes, each acknowledged by a part of Europe. Innocent's rival was Benedict XIII., who held his court at Avignon. [BENEDIOT, ANTIPOPE.] After the election of Innocent a tumult broke out in Rome, excited by the Colonna and by Ladislaus, king of Naples, which obliged the pope to escape to Viterbo. Ladislaus however failed in his attempt upon Rome; and Innocent having returned to his capital, excommunicated him. Innocent died at the end of 1406, after having made his peace with Ladislaus.

INNOCENT VIII., CARDINAL GIOVANNI BATTISTA CIBO, of Genoa, succeeded Sixtus IV. in 1485. He favoured the revolted Neapolitan barons against Ferdinand I. of Naples, in consequence of which the troops of Ferdinand ravaged the territory of Rome, but through the mediation of Lorenzo de' Medici and of the Duke Sforza of Milan, peace was re-established between the two parties. Pierre d'Autubsson, grand-master of the order of St. John of Rhodes, having sent to Rome Ziziu, brother of Bayazid sultan of the Turks, who had run away from his brother, and who was considered as an important hostage, the pope received him with great honour, but took care to secure his person. It was also during this pontificate that Giovanni de' Medici,

son of Lorenzo, and afterwards Pope Leo X., was made cardinal when only fourteen years of age. Innocent died in 1491, and was succeeded by Alexander VI. He enriched his natural sons; and the family of Cibo, which was already possessed of the duchy of Massa, became by a marriage alliance with the family of Malaspina possessed also of that of Carrara, which their descendants have retained till within our times.

INNOCENT IX., GIOVANNI ANTONIO FACCHINETTI, of Bologna, a man of learning and piety, was elected after the death of Gregory XIV., in October 1591. He died two months after his election, and was succeeded by Clement VIII.

INNOCENT X., CARDINAL GIOVANNI BATTISTA PANFILI, was elected in September 1644, after the death of Urban VIII. He was then seventy-three years of age, and is said to have been in great measure ruled by his sister-in-law Donna Olimpia Maidalchini Panfilii, who appears to have been an unprincipled woman, very fond of money, and of aggrandising her relatives. Innocent however displayed in several instances much firmness, justice and prudence, and a wish to protect the humble and poor against the oppressions of the great. He diminished the taxes, and at the same time embellished Rome. The people of Fermo on the Adriatic revolted against their governor, being excited by the local nobility and landholders, who were irritated against him for having by an edict of annona kept the price of corn low; the governor and other official persons were murdered. Innocent sent a commissioner with troops, and the guilty, without distinction of rank, were punished, some being executed, and others sent to the galleys. The district of Castro and Ronciglione, near Rome, was still in possession of the Farnese dukes of Parma, notwithstanding the efforts of Urban VIII. to wrest it from them. Disputes about jurisdiction were continually taking place between the officers of the duke and those of the pope. Innocent having consecrated a new bishop of Castro who was not acceptable to the duke, the latter forbade him entering his territories, and as the bishop elect persisted, he was murdered on the road. The pope immediately sent troops to attack Castro, which being taken, he ordered the town to be razed to the foundations, and a pillar erected on the site, with the inscription "Qui fù Castro." The episcopal see was removed to Acquapendente, and the duchy was reunited to the papal state. Innocent died in 1655, and was succeeded by Alexander VII.

INNOCENT XI., CARDINAL BENEDETTO ODESCALCHI, of Como, succeeded Clement X. in 1676. It is said that he had been a soldier in his younger years, though this has been denied by others. (Count Torre Rezzonico, 'De Suppositis Militaribus Stipendiis Benedicti Odescalchi.') He was a man of great firmness and courage, austere in his morals, and inflexible in his resolutions. He took pains to reduce the pomp and luxury of his court, and to suppress abuses; he was free from the weakness of nepotism, and his own nephew lived at Rome under his pontificate in a private condition: but his austerity made him many enemies, and his dislike of the then very powerful Jesuits still more. The principal event of his pontificate was his quarrel with the imperious Louis XIV. of France, on the subject of the immunities enjoyed by the foreign ambassadors at Rome. As this incident exhibits in a singular light the character of the times, it may deserve a few words of explanation. By an old usage or prescription the foreign ambassadors at Rome had the right of asylum, not only in their vast palaces, but also in a certain district or boundary around them, including sometimes a whole street or square, which the officers of justice or police could not enter, and where consequently malefactors and dissolute persons found a ready shelter. These "quartieri," or free districts, were likewise places for the sale of contraband articles, and for defrauding the revenue. This abuse had become contagious: several of the Roman princes and cardinals claimed and enforced the same rights and immunities, so that only a small part of the city was left under the sway of the magistrates. The classical advocates for this absurd custom quoted the example of Romulus, who made his new town a place of refuge for all the lawless persons of the neighbourhood. Innocent determined to put a stop to the abuse, and to be master in his own capital; he however proceeded at first calmly and with sufficient caution. He would not disturb the present possessors of those immunities, but he declared and made it officially known that in future he should not give audience to any new ambassador who did not renounce for himself and his successors all claim to the district immunities. Spain, Venice, and other states demurred at this very reasonable determination; but the death of the Maréchal d'Estrées, ambassador of France, brought the question to a crisis. Innocent repeated in a bull, dated May 1687, his previous resolve. Louis XIV. appointed to the embassy the Marquis of Lavardin, and told him "to maintain at Rome the rights and the dignity of France;" and in order to support this dignity he gave him a numerous retinue of military and naval officers, who were to frighten the pope in his own capital. Lavardin's entrance into Rome, under such an escort, resembled that of a hostile commander. He had also been preceded by several hundred reduced French officers, who had entered Rome as private travellers, but who took their quarters near the ambassador's palace, ready for any mischief. Innocent however remained firm; he refused to receive the new ambassador, and all the anger of Louis, who seized upon Avignon and threatened to send a fleet with troops on the Roman coast, had no effect upon him. Lavardin, having remained eighteen

months at Rome without being able to see the pope, was obliged to return to France with his credentials unopened. The quarrel was not made up till the following pontificate: but the district immunities of the foreign ambassadors at Rome continued partly, and with some modifications, till the beginning of the 19th century. The Piazza di Spagna, and some of the adjacent streets, were under the protection of the Spanish ambassador. Innocent died in August 1689, and was succeeded by Alexander VIII. (Botta, *Storia d'Italia*.)

INNOCENT XII, CARDINAL ANTONIO PIGNATELLI, of Naples, succeeded Alexander VIII in July 1691. He had a serious dispute with the Emperor Leopold I, who, attempting to revive in Italy the rights of the Empire over the former imperial fiefs, which had during the wars and vicissitudes of ages become emancipated, published an edict, which was fixed up at Rome in June 1697, enjoining all the possessors of such territories to apply to the emperor for his investiture within a fixed time, or they would be considered as usurpers and rebels. This measure, if enforced, would have affected the greater part of the landed property of Italy, and also the sovereignty of its governments, and of the Roman see among the rest. The pope protested against the edict, and advised the other Italian powers to resist such obsolete pretensions; and, being supported by the court of France, he succeeded in persuading Leopold to desist from them. Innocent built the harbour of Porto d'Anno, on the ruins of the ancient Antium; he constructed the aqueduct of Civita Vecchia; the palace of the Monte Citorio at Rome, for the courts of justice; and the fine line of buildings at Ripagrande, on the north bank of the Tiber, below the town, where vessels which ascend the river load and unload. He also built the asylum, schools, and penitentiary of San Michele, and other useful works. Innocent was of regular habits, attentive to business, a lover of justice, and averse from nepotism. He died in September 1700, at the age of eighty-six, and was succeeded by Clement XI.

INNOCENT XIII, CARDINAL MICHEL ANGELO CONTI, succeeded Clement XI in May 1721. He was a man of prudence and experience of the world, and less wilful and headstrong than his predecessor. [CLEMENT XI.] He obtained of the emperor the restitution of Comacchio. His pontificate was short, as he died in March 1724, and was succeeded by Benedict XIII.

INWOOD, the family name of three architects, father and two sons, who constructed many public and private buildings in London and elsewhere.

WILLIAM INWOOD was born about the year 1771. His father, Daniel Inwood, was bailiff to Lord Mansfield, at Caen Wood, Highgate, near London. William Inwood was brought up to the professions of architect and surveyor. He was employed as steward to Lord Colchester, was surveyor to a large number of persons, and several architects who subsequently attained celebrity were instructed by him. He had two sons, one or other of whom was employed conjointly with himself in most of his larger works of architecture, and he was assisted generally in all his professional pursuits by both. He died March 16th 1843, aged about seventy-two. He was the author of 'Tables for the Purchasing of Estates, Freehold, Copyhold, or Leasehold; Annuities, and for the Renewing of Leases held under Cathedral Churches, Colleges, or other Corporate Bodies, for Terms of Years certain and for Lives, &c.,' 8vo, London, 1811, a work founded on those of Baily and Smart. It principally differs from previous works in giving the values to years and quarters, as well as to decimals of a year; the former being intended for those who cannot read decimal fractions.

HENRY WILLIAM INWOOD, the eldest son of William Inwood, was born May 22nd 1794. He was brought up by his father to his own professions. He was several years in Greece, and examined with great care the architectural remains at Athens and elsewhere, and made plans and drawings of them. He assisted his father in most of his architectural pursuits, especially in designing and constructing St. Pancras Church; and had he not suffered so much as he did for many years from ill health, would probably have attained to great eminence as an architect. His death is supposed to have occurred on the 20th of March 1843, about which time a ship in which he had sailed for Spain was wrecked, and all on board perished.

Henry Inwood published in 1827 'The Eretheion at Athens, Fragments of Athenian Architecture, &c., illustrated with Thirty-nine Plates.' The work, which consists of 162 pages exclusive of the plates (engraved by Nicholson), is printed on elephant paper of very large size, and was published by subscription. He had also commenced a work entitled 'Of the Resources of Design in the Architecture of Greece, Egypt, and other Countries, obtained by the Studies of the Architects of those Countries from Nature,' 4to, London, 1834, with explanatory engravings. Two parts were published, but owing to ill health and his untimely death the work was never completed. He collected many fossils and remains of ancient art, most of which are now in the British Museum.

CHARLES FREDERIC INWOOD, second son of William Inwood, born November 28th 1798, besides assisting his father in his works, was the architect of the church of All Saints at Great Marlow, in Buckinghamshire, which was completed in 1835. He also built the St. Pancras National School in Southampton Street, Euston Square, a large plain brick building of little architectural pretension. He died in May 1840, aged forty-two.

St. Pancras Church, New Road, London, which was the conjoint work of William Inwood and his son Henry, is in its kind unique among the churches of the metropolis. The building was commenced July 1st 1819, was completed May 7th 1822, and cost 76,769*l*. The exterior of the body of the church is, with certain necessary deviations, an imitation of the Ionic temple called the Eretheion on the Acropolis at Athens; the tower is an adaptation from the building commonly called the Tower of the Winds also at Athens, which is properly the Horologium, or water-clock, of Andronicus Cyrrhestes. The measurements and drawings of these buildings were made by Henry Inwood on the spot. The semicircular apsis at the east end of the church supplies the place of the straight west wall of the Pandrosion, or temple of Pandrosos, which adjoined the Eretheion at the west end. The two covered buildings which project from each side of the east end, forming the entrances to the catacombs of the church, are adaptations from the south portico of the Pandrosion. The caryatid figures, of which there were six, four in front and one at each side, were in the place of columns, and supported the pediment of the south portico of the Pandrosion; the opposite north portico had columns. There is one of the original caryatid figures in the Elgin Room of the British Museum. The sarcophagus beneath each roof indicates the purpose for which the projecting buildings have been constructed. The two Ionic half-columns engaged in the walls, on both sides of the west end, are additions made to form an apparent basis for the tower. The windows are adaptations modelled in accordance with the form of the doors. Grecian temples had no windows; large temples had a central portion of the roof open to the sky; small temples generally received light only from the door, which was wide and lofty. The octagonal tower, with its two ranges of eight columns each, in its form and general effect combines well with the building and portico, and is in itself a beautiful object. In the interior the galleries are supported by elegant slender columns. The ceiling is flat, and formed into a number of ornamented panels.

The Westminster Hospital, near the west end of Westminster Abbey, was built by William Inwood in conjunction with his son Charles. It was begun in 1832, completed in 1834, and cost 27,500*l*. The architecture is Tudor Gothic, the material is gray Suffolk brick, with stone facings. It is quite plain, except the front and the truncated angles which connect the front with the two ends. The front extends about 200 feet in length, and is 72 feet high in the centre, which projects slightly, and is a story higher than the two wings. There are in all 260 windows. The brick harmonises well with the stone portico and dressings, and the general appearance of the front is very handsome. The interior arrangements and ventilation are excellent.

William Inwood also built the Regent Square Chapel, opened in 1826; the Camden Town Chapel, opened in 1824; and Somers Chapel, in Seymour Street, opened in 1826—all of which are chapels of ease to St. Pancras Church. He also built numerous other structures, mansions, villas, barracks, warehouses, &c.

IPHICRATES, an Athenian general, most remarkable for a happy innovation upon the ancient routine of Greek tactics, which he introduced in the course of that general war which was ended B.C. 387 by the peace of Antalcidea. This, like most improvements upon the earlier methods of warfare, consisted in looking, for each individual soldier, rather to the means of offence than of protection. Iphicrates laid aside the weighty panoply, which the regular infantry, composed of Greek citizens, had always worn, and substituted a light target for the large buckler, and a quilted jacket for the coat of mail; at the same time he doubled the length of the sword, usually worn thick and short, and increased in the same, or, by some accounts, in a greater proportion, the length of the spear. It appears that the troops whom he thus armed and disciplined (not Athenian citizens, who would hardly have submitted to the necessary discipline, but mercenaries following his standard, like the Free Companions of the middle ages), also carried missile javelins; and that their favourite mode of attack was to venture within throw of the heavy column, the weight of whose charge they could not have resisted, trusting in their individual agility to baffle pursuit. When once the close order of the column was broken, its individual soldiers were overmatched by the longer weapons and unnumbered movements of the lighter infantry. In this way Iphicrates and his targetiers (peltastes), as they were called, gained so many successes that the Peloponnesian infantry dared not encounter them, except the Laedemonians, who said in scoff that their allies feared the targetiers as children fear hobgoblins. They were themselves taught the value of this new force, B.C. 392, when Iphicrates waylaid and cut off nearly the whole of a Laedemonian battalion. The loss in men was of no great amount, but that heavy-armed Laedemonians should be defeated by light-armed mercenaries was a marvel to Greece, and a severe blow to the national reputation and vanity of Sparta. Accordingly this action raised the credit of Iphicrates extremely high. He commanded afterwards in the Hellespont, B.C. 389; in Egypt, at the request of the Persians, B.C. 374; relieved Corcyra in 373, and served with credit on other less important occasions. The date of his death is not known. (*Xen., Hell.; Diod.; Corn. Nep.*)

IRELAND, SAMUEL, was born in London, and was in early life a mechanic in Spitalfields. He afterwards became a dealer in curiosities, and resided in Norfolk-street, Strand. He possessed some skill in drawing, learnt to engrave, and, in order to turn these acquire-

ments to advantage, he wrote many tours, with engraved views (chiefly in aquatint) of spots he had visited. The first was a 'Picturesque Tour through Holland, Brabant, and a part of France,' which was published in 1789. To this succeeded, among others, 'Picturesque Views on the Thames,' 1792; 'Graphic Illustrations of Hogarth,' 1794; 'Picturesque Views on the Upper or Warwickshire Avon,' 1795: in collecting the materials for this work he was accompanied by his son, who says the visit gave rise to his imposition respecting his Shakspeare papers. The father published these forgeries, with a firm reliance on their authenticity, in 1796; and on the avowal of the forgery by his son, he quarrelled with him, and was only reconciled on his approaching death, which, it is said, this affair hastened. His last work was 'Picturesque Views, and an Historical Account of the Inns of Court in London and Westminster,' published in 1800, and in July of this year he died. None of his works have any great value; he was apparently a credulous simple-minded man, but they contain interesting memorials of places now considerably altered, though probably not scrupulously correct even at the time.

IRELAND, SAMUEL WILLIAM HENRY (though he dropped the Samuel to all his productions), was the son of the preceding, and was born in Norfolk-street, Strand, in 1777. He would be scarcely worth a notice, except in connection with the Shakspeare forgeries, as to which the credulity of many eminent men is far more remarkable than the skill of their concoction. Ireland received an education at several private schools and in France. When about sixteen he was articled to a conveyancer in New Inn. In 1795, as we have already stated, he accompanied his father on a visit to Stratford and the Avon; and he says his father's enthusiasm for Shakspeare, and his ardent desire to possess any sort of relic, first induced him to forge a deed, or lease, containing a pretended autograph of Shakspeare, which he presented to his father as having found among some old law papers. The father was delighted, and suggested that something more might be found in the same quarter. Thus invited, young Ireland continued his work till he had produced a quantity sufficient to form the publication already spoken of. It is not necessary to give a list of this worthless rubbish, but it was announced, that among the Shakspeare papers was a new play, entitled 'Vortigern,' also by Shakspeare, which would not be published till after it had been performed. Sheridan purchased it for Drury-Lane Theatre, though he does not seem to have had a high notion of its merits. It was produced, with John Kemble as Vortigern. The house was crowded, and had most likely come prepared to applaud. But the inanity of the play was too much for them; they listened in vain for some Shakspearean touch, and when Kemble, in his part, uttered the line—

"And now this solemn mockery is o'er,"

the storm burst; the disapprobation was decided and loud, and when the curtain dropped, 'Vortigern' disappeared from the stage for ever. In the meantime the attacks of Malone and others, denying the authenticity of the papers, had rendered the elder Ireland uneasy. He required his son to discover the source from which he had procured the pretended Shakspearean manuscripts, and at length he was forced to acknowledge the deception he had practised. He left his father's house, and abandoned his profession. He wrote a number of other works, which were published at various times. At the end of 1796 he had published his first announcement that he was himself the author of all the papers published as Shakspeare's, to vindicate, as he says, his father from the charge of having been an accomplice. This was expanded into his 'Confessions,' published in 1805—a work alike remarkable for its vanity and its emptiness. He also wrote the romances of 'The Abbess' and 'Gandez the Monk,' each in four volumes, published in 1799 and 1804; 'The Woman of Feeling,' a novel, in four volumes; 'Neglected Genius,' a poem, in 1812, with many others; none of which were of more value than his Shakspeare papers, and drew infinitely less attention. Subsequently he wrote various things for the booksellers, of which the most important perhaps was the descriptive part of an illustrated 'History of Kent,' in 4 vols. He died on April 17, 1835.

IRENÆUS, SAINT, Bishop of Lyon in Gaul, was a pupil of Polycarp, in Asia Minor (Iren., 'Adv. Her.' iii. 3, § 4; Eusebius, 'Hist. Eccl.' v. 20), and a presbyter of Pothinus, bishop of Lyon. He carried a letter from the church of Lyon to Eleutherus, bishop of Rome, respecting some disputes which existed between them, in which he is honourably mentioned. On the martyrdom of Pothinus, at the age of ninety, in 177, Irenæus was elected bishop of Lyon. He discharged the duties of his office with exemplary diligence and faithfulness, and is said to have been the means of converting many pagans to the Christian religion. The place of his birth is not known; but it is probable from his name that he was a Greek, and from his early acquaintance with Polycarp that he was a native of Asia Minor. Critics differ considerably respecting the date of his birth: Dodwell places it about A.D. 97, Grabe about 108, Du Pin about 140, and Tillemont about 120: it was probably between the two latter dates. It is commonly supposed that he suffered martyrdom in the beginning of the 3rd century; but the fact of his martyrdom has been doubted by many critics, from the silence of Tertullian, Eusebius, and most of the early fathers.

With respect to the works of Irenæus, we learn from Eusebius ('Hist. Eccl.' v. 20), "that he wrote several letters against those who

at Rome corrupted the true doctrine of the church; one to Blastus, concerning sobism; another to Florinus, concerning the monarchy, or that God is not the author of evil; and concerning the number eight." Eusebius also mentions (v. 26) "a discourse of Irenæus against the Gentiles, entitled, 'Concerning Knowledge;'" another, inscribed to a brother named Marcianus, being a demonstration of the apostolical preaching; and a little book of divers disputations." Irenæus also wrote a letter to Victor, bishop of Rome, concerning the controversy about the time of holding Easter; and also 'Five Books against Heresies.' The last work is still extant; but all the rest have perished, with the exception of a few fragments. The original Greek of the 'Five Books against Heresies' has also been lost; we possess only a Latin translation of it, written in an uncouth style, which was made, according to Dodwell's computation ('Dissert. Iren.' v. 9, 10), about 385. This circumstance renders the work of little value in ascertaining the readings of the Greek Testament in the time of Irenæus, since the Latin translator appears to have quoted the text of Scripture according to the Latin version then in use.

It is difficult to determine at what period the 'Five Books against Heresies' were written, but they all appear to have been composed after Irenæus became Bishop of Lyon, and to have been published at different times. Irenæus was well acquainted with heathen literature and the doctrines of the heretics of his time. His work is very valuable in an historical point of view, and has been highly commended by most of the fathers; though Photius ('Bibl.' c. 120) gives rather a different opinion of it, thinking "that the purity of the faith with respect to ecclesiastical doctrines is adulterated by the false and spurious reasonings of Irenæus."

Irenæus was a diligent collector of apostolical traditions. He informs us, in many parts of his work, that he was well acquainted with several persons who had been intimate with the apostles. Many of his traditions are of a very curious kind. He affirms that Christ was at least fifty years old at the time of his crucifixion, and he asserts the most extravagant opinions with regard to the Millennium. Middleton, in his 'Free Inquiry' (p. 45-52), has given an interesting account of many of the opinions of this father.

The life of Irenæus has been written by Gervaise, Paris, 1723. His works have been published by Erasmus, 1526; by Feuardent, 1596; by Grabe, 1702; by Masuet, 1710; and by Pfaff, 1734. Some of the fragments published for the first time by Pfaff are supposed by Lardner ('Credibility of the Gospel History,' Works, ii., p. 189-191, ed. of 1831) to be spurious.

IRETON, HENRY, the eldest son of German Ireton, of Attenton, in Nottinghamshire, was born in 1610. He was entered at Trinity College, Oxford, in 1626, and having taken the degree of bachelor of arts, became a student of the Middle Temple. His legal studies were interrupted by the outbreak of the civil war; he entered the parliamentary army, and soon became very proficient in the military art. It has even been asserted that Oliver Cromwell learned its rudiments from him. In 1646 he married Bridget, Cromwell's eldest daughter, by which connection and his own merit he gained a commission, first of captain of horse, and almost immediately afterwards that of colonel. He distinguished himself in the battle of Naseby, was taken prisoner by the royalists, but made his escape. Ireton was perhaps more than any other man the cause of King Charles's death; by intercepting a letter, he is said to have discovered that it was the king's intention to destroy him and Cromwell, and from that time he rejected any accommodation: he attended most of the sittings of the regicide court, and signed the warrant for Charles's execution. On the establishment of the Commonwealth he was appointed to go to Ireland, next in command to Cromwell. He was made president of Munster, and afterwards lord-deputy of Ireland. The greater part of the country submitted to him from fear of his cruelty, without striking a blow. While in the height of his successes he was seized, before Limerick, with the plague, of which he died on the 15th of November 1651. His body was landed at Bristol, and lay in state at Somerset House. On an achievement over the gate of Somerset House was the motto, "Dulce et decorum est pro patria mori," which was readily translated, "It is good for your country that he is dead." He was buried in Henry VII's chapel in Westminster Abbey; but the corpse was exhumed after the Restoration, gibbeted, and burnt at Tyburn. He left one son, Henry, and four daughters. Ireton was revered by the republicans as a soldier, a statesman, and a saint. He was called the 'scribe,' from his skill in drawing up declarations, petitions, and ordinances. His antagonists allowed him to be an able, but assert that he was a designing statesman. He refused a grant of 2000*l.* a year, which was offered to him out of the confiscated estate of the Duke of Buckingham; and after his death the parliament, out of gratitude for his services, settled it upon his widow and children.

IRVING, REV. EDWARD, was born August 15th 1792 at Annan, in Dumfriesshire, where his father was a tanner. He was educated at the University of Edinburgh, and took the degree of M.A. He is stated to have joined a theatrical company, but to have left it after a very brief trial. In 1811 he was appointed to superintend the mathematical school at Haddington, whence he removed in 1812 to Kirkcaldy, where he became the rector of an academy. He remained at Kirkcaldy about seven years, when, having completed the probation required by the Church of Scotland, and received ordination from the presbytery of Annan, he

officiated at various churches. Dr. Chalmers having heard him preach a sermon at Edinburgh, afterwards engaged him as his assistant at St. John's church, Glasgow. In that city Mr. Irving acquired so high a reputation that he was invited to supply the vacancy which had occurred in the Caledonian Church, Cross Street, Hatton Garden, London, and early in July 1823 preached his first sermon there. In a few weeks he began to attract large congregations; in three months the applications for seats had risen from 50 to 1500; at length it became necessary to exclude the general public, and to admit only those who were provided with tickets. Statesmen, orators, the noble, the wealthy, the fashionable, occupied the seats of the church, and their carriages thronged the adjoining streets. The preacher was six feet high and very athletic, with good features, but sallow, and with a very obvious squint. A profusion of glossy black hair hung down to his shoulders. His general aspect was stern and solemn. The composition of his discourses was rhetorical and declamatory, and his delivery of them, with a strong Scotch accent, was accompanied by violent but expressive gesticulations, his whole appearance and manner being in the highest degree singular and exciting.

In 1823 Mr. Irving published a series of connected discourses, which had been delivered on Sunday evenings, under the title of 'For the Oracles of God, Four Orations: For Judgment to Come, an Argument in Nine Parts.' On the 14th of May 1824, at the request of the London Missionary Society, he preached a sermon on Missions in the Tabernacle, Tottenham Court Road. When published about twelve months afterwards it was greatly expanded, and was entitled, 'For Missionaries of the Apostolic School, a Series of Orations, in Four Parts.' The first oration however was the only one published, its doctrines having been received with disapprobation by many persons who supported the missionary cause. In 1827 he published 'The Coming of the Messiah in Glory and Majesty, by Juan Josafat Ben Ezra, a Converted Jew,' translated from the Spanish. In 1828 he published a 'Letter to the King on the Repeal of the Test and Corporation Acts,' a measure which he decidedly opposed. In the same year he published 'Sermons, Lectures, and Occasional Discourses,' 3 vols. 8vo; and in 1829 'Church and State responsible to each other, a series of Discourses on Daniel's Vision of the Four Beasts.'

The church in Cross Street being much too small for the accommodation of the congregations that assembled there, Mr. Irving's followers commenced a subscription for the purpose of erecting a larger and more commodious church, and in 1829 a handsome edifice was completed and opened in Regent Square, Gray's Inn Road. Before this time however his peculiarities of manner had become familiar, critical opponents had made their appearance, and his popularity was on the wane. At a meeting of the presbytery of London, November 20th 1830, he was charged with heresy. The proceedings were prolonged for about eighteen months, during which his religious opinions remained unchanged, and in addition he introduced at his church the extravagancies of the unknown tongues. This supposed supernatural inspiration originated with some females at Glasgow, and was gradually transferred to Mr. Irving's church, at first privately in prayer-meetings held at half-past six in the morning, but afterwards publicly in crowded congregations. Mr. Irving published, in Fraser's Magazine, 'Facts connected with the recent Manifestations of Spiritual Gifts.' At length, the presbytery of London having pronounced sentence against him, the trustees of the church in Regent Square came to a unanimous decision, May 8, 1832, that "the Rev. Edward Irving had rendered himself unfit to remain a minister of the Caledonian Church, Regent Square, and ought to be removed therefrom." His ejection took place accordingly, and he then occupied, with such of his congregation as still adhered to him, a building in Gray's Inn Road, whence he afterwards removed to Newman Street, where he occupied the room which had been West's picture-gallery. He was next cited before the presbytery of Annan to answer the charge of heresy. He attended and made his answer, when that presbytery unanimously pronounced a sentence of deposition from the ministry, March 15th, 1833. His constitution soon afterwards began to give way under consumption, and he died December 8, 1834, at Glasgow, and was buried in the crypt of the cathedral. He was married at Kirkcaldy on the 14th of October 1822, and left a widow and children.

IRVING, WASHINGTON, was born April 8, 1783, in the city of New York, where his father, a native of Scotland, had settled as a merchant. He received a home education under the superintendence of his elder brothers, who were young men of considerable literary attainments. Fortunately perhaps for his genius, his health being too uncertain to permit of his entering upon commercial pursuits, he spent much of his youth in wandering about the picturesque haunts of Manhattan Island, where, among the old-fashioned inhabitants, he picked up many of the quaint traditions which he subsequently turned to so much advantage, and early familiarity with which no doubts (as was the case with Scott) imparted something of that peculiar colouring which has distinguished his imaginative works. His health continuing weak, he was when about twenty advised to proceed to the south of Europe. On this tour he spent about three years, visiting Sicily, Naples, and Rome, and then passing by way of France to England.

Before his European trip he had in 1803 contributed some letters, signed 'Jonathan Oldstyle,' to a newspaper, 'The New York Morning Chronicle,' conducted by one of his brothers; and on his return to

America he joined with Mr. Kirke Paulding, a man of congenial humour, in writing 'Salmagundi,' a series of papers which by their novelty of style and freshness of matter at once obtained great popularity. The work, commenced at the beginning of 1807, was, owing to a difference with the publisher, brought to a sudden termination at the close of that year. After 'Salmagundi' was ended, Irving continued to write occasionally for the magazines and newspapers; and in 1809 appeared the inimitable 'History of New York,' by Diedrich Knickerbocker, a work which at once raised its author to the first place among his countrymen for original humour and literary skill. It is said that, like 'Gulliver's Travels,' it at first found many readers who regarded it as a veritable though somewhat extraordinary history; and some among the soberer citizens, as well as many of the descendants of the old Dutch settlers, were with difficulty brought to forgive the author for so irreverently handling a grave historical theme; but by the great body of the New Yorkers the wit was heartily relished, and Irving at once became, as he has ever since continued to be, the most popular of native writers.

Literature however was not as yet thought of by Irving as a profession. After his return from Europe he had entered upon the study of the law in the office of Judge Hoffman. But the desultory habits he had formed while strolling about Manhattan, or travelling through Europe; the celebrity he had acquired by the Salmagundi papers and occasional magazine articles; the literary investigations he had entered upon for his Knickerbocker history; and not least perhaps the possession of ample pecuniary means, which enabled him to follow at pleasure more immediately interesting pursuits, and seemed to render unnecessary any future dependence on professional position, combined to divert his attention from Coke and Blackstone; and though he was admitted to the bar, he seems never to have had any serious intention of practising. The mercantile business established by his father was an extensive one, and on the father's death had been continued under the name of Irving, Brothers. The elder brothers now admitted Washington to a certain share in the firm, but his connection with the business was apparently little more than nominal. On the outbreak of the war with England, Irving volunteered his services; was appointed aide-de-camp to General Tomkins, the governor of New York; created a colonel, and employed on 'special service.' He also during this period edited a magazine. Peace put an end at once to his military and his editorial duties. Colonel Irving laid down his title, and once more merged in the firm of Irving, Brothers. A branch of the establishment was carried on at Liverpool, and Washington Irving was despatched thither to conduct it. But in the train of peace followed commercial disaster, and Irving has himself related how he became for a time its victim. The firm of which he was a partner was broken up, and he turned naturally to his pen, as he says, for solace and support.

It was under these circumstances that in 1818 he began his famous 'Sketch-Book.' As he wrote the successive papers in England they were transmitted to New York, and there published. Their reception in New York was enthusiastic, and they soon came to be heard of in England. The 'Literary Gazette' printed large portions of them "with many encomiums," and Irving heard that it was the intention of a London publisher to collect and reprint them all. He says that he "had been deterred by the severity with which American productions had been treated by the British press" from himself preparing an English edition; but this report removed his apprehensions, and he resolved to do so. In the preface to an edition of the 'Sketch-Book' published in 1848, he has given an amusing account of the difficulty he found in inducing a publisher to undertake the risk on favourable terms. In his perplexity he applied to Sir Walter Scott, from whom he had some years before experienced a hospitable welcome at Abbotsford. Scott spoke with warm admiration of the specimens Irving sent him, but even he seems to have found it no easy matter to persuade Constable to undertake the publication. But "the hint about a reverse of fortune," says Irving, "had struck the quick apprehension of Scott, and, with that practical and efficient goodwill which belonged to his nature, he had already devised a way of aiding me." In fact Scott offered him the appointment of editor, with a salary of 500*l.* a year, of a weekly periodical then about to be started in Edinburgh. Scott however expressed doubts whether, as the journal was to be a political one, Irving would like the tone it was intended to take; and Irving in his reply said that, much as such an avowal of confidence had cheered him, he must decline the offer, not only on political grounds, but because he felt himself unfitted for the work by the very constitution and habits of his mind. "My whole course of life," Irving wrote, "has been desultory, and I am unfitted for any periodically-recurring task, or any stipulated labour of body or mind. I have no command of my talents, such as they are, and have to watch the varyings of my mind as I should those of a weathercock. Practice and training may bring me more into rule, but at present I am as useless for regular service as one of my own country Indians or a Don Cossack. I must therefore keep on pretty much as I have begun—writing when I can, not when I would. I shall occasionally shift my residence, and write whatever is suggested by objects before me, or whatever rises in my imagination, and hope to write better and more copiously by-and-by." We quote this passage because it seems to us to show how accurately Mr. Irving had already taken the measure of his literary ability and

mental peculiarities. He has learnt since to apply with more steadiness to literary labour, but it has been in the line and in the manner he thus early pointed out; and his success in almost everything he has undertaken has to a great extent unquestionably arisen from his having always taken this unexaggerated estimate of his intellectual capacity.

As regarded the 'Sketch Book,' Irving eventually resolved to publish it at his own risk, and the first volume was so issued; but before a month had elapsed the publisher to whom it was entrusted failed, and the sale was stopped. Scott came now effectually to the rescue: at his instance Murray undertook the publication, and thenceforward Irving never was in need of help. The success of the 'Sketch Book' was beyond that of any previous volume of disconnected essays. The book became a universal favourite. Its genial wit, quaint grace, gentle pathos, and quiet Addisonian style, were generally appreciated. The story of Rip Van Winkle acquired unbounded popularity; the other legends were hardly less admired, and the sketches of English scenery and English manners were as much relished in England as in America. Irving became at once famous in both countries. The second volume of the 'Sketch Book' appeared in 1820. His next work, written chiefly in Paris, was 'Bracebridge Hall,' published in 1822, a work which amply sustained his reputation. In 1824 appeared the 'Tales of a Traveller,' chiefly the result of his travels on the continent, but also, it may be noticed, containing the last of his sketches descriptive of English life.

Mr. Irving was still in France when he was informed by Mr. Everett, the United States minister at Madrid, of important discoveries having been made in Madrid by S. Navarrete respecting Columbus; and invited to proceed to that city with a view to examining, and if he deemed it advisable, translating these documents. Irving accordingly went there, but he soon became convinced that the best application of these new materials, would be to use them as the ground-work of a life of the great admiral. He accordingly applied himself diligently to the task, and as the Spanish archives were liberally opened to him he was enabled to embody in his work a great deal of new matter. The 'History of the Life and Voyages of Christopher Columbus' was published in 1828, and was succeeded in 1831 by a supplementary work on the 'Voyages and Discoveries of the Companions of Columbus.'

Mr. Irving's residence in Spain and his researches connected with its early history had excited in him considerable interest in the Moorish conquerors of Granada; and the result of further studies was a kind of historical romance, entitled 'A Chronicle of the Conquest of Granada, by Fray Antonio Agapida,' 2 vols. 1829. His Moorish studies, a residence of some months in the ancient palace of that remarkable people, and rambles about the old cities of Spain, led him to write in his old manner a series of sketches which he published in 1832 under the title of the 'Alhambra.'

In the summer of 1829 Mr. Irving received the appointment of secretary of legation at London. Whilst in England he mingled freely in the best society, and was the lion of at least one season. He received, in 1830, one of the two gold medals of the Royal Society of Literature, the other being given to Mr. Hallam, and the University of Oxford bestowed on him the degree of LL.D. It was not till 1832, "after an absence of seventeen years," that he "saw again the blue line of his native land." His reception in New York, as indeed in every part of America which he subsequently visited, was of the most enthusiastic kind. But he did not stay long in his native city; an opportunity offering, he the same autumn accompanied Mr. Ellsworth the Indian commissioner, and Mr. Latrobe the author of 'Rambles in North America,' in a journey to the far west, and, as of yore, "writing of what was suggested by objects before him," his journey produced a 'Tour on the Prairies.' This work was not however published till 1835. He had meanwhile purchased an estate by the spot he had described as Sleepy Hollow, and the fitting up after his own fancy the old mansion of the Van Tassels, which he named Woolfert's Roost, had occupied no small amount of time. The 'Tour' was followed in the same year by his recollections of 'Abbotsford and Newstead Abbey,' and by his 'Legends of the Conquest of Spain.' To these, in 1836, succeeded 'Astoria, or Enterprise beyond the Rocky Mountains,' and in the next year the 'Adventures of Captain Bonneville; or, Scenes beyond the Rocky Mountains of the Far West.'

This was the most prolific period in Mr. Irving's literary career. For some years following no separate work was published from his pen. During 1839 and 1840 he supplied under an engagement a series of papers to 'Knickerbocker's Magazine.' In 1841 he received the appointment of minister plenipotentiary to the court of Spain. The appointment was a popular one in Madrid, where his previous residence and his 'Life of Columbus' had gained him numerous friends. He remained there above four years, having only been recalled, at his own request, on Mr. Polk's election to the presidency in 1846.

On his return to America, Mr. Irving retired to his beautiful residence on the Hudson, and renewed his literary avocations: his first employment being the publication of a carefully revised edition of his complete works. But he had for some years been pondering a work on the rise and progress of Mohammedanism, and it eventually took the form of a biography of the prophet, with sketches of his immediate successors: it appeared in 1849-50 under the title of 'Mahomet and his Successors.' He also about this time published a pleasantly

written biography of Oliver Goldsmith—ostensibly an expansion of a brief sketch he had some years previously drawn up for an American edition of Goldsmith's works, but really a recasting of Mr. Forster's newly published life of Goldsmith. He did not again appear before the world as an author till 1855, when he published a volume of sketches, some of which had appeared in the New York magazines, entitled 'Chronicles of Woolfert's Roost and other Papers,' which were marked by all the old polish and elegance, and very much of the humour and vigour which had rendered the 'Sketch Book' so general a favourite. But his countrymen were watching for a more important work. It was well known that he had been engaged even before his mission to Spain in collecting materials for a new biography of the great founder of American independence, and that it was the task he had selected as his crowning literary labour. It was accordingly looked forward to with much eagerness, and the first volume of the 'Life of Washington' (1855), met with a warm welcome. A second and third have since followed, and a fourth is announced to complete the work. Like Mr. Irving's other historical works, it is marked by an excellent style of narrative, without making any pretension to philosophy or profundity. Carrying with it evidence of very considerable, though not much original, research, it also is distinguished by strict impartiality; while it displays a just appreciation of the moral and mental character and conduct of the hero, and a warm sympathy with his grand enterprise: and above all, it has the great merit of being a thoroughly readable book. Still it may fairly be doubted whether to succeeding generations, as to his contemporaries, the name of Washington Irving will not recall rather the author of the 'Sketch Book,' and the narrator of Rip Van Winkle, than the historian of the Conquest of Granada, or the biographer of Mahomet and Washington.

ISAAC. [JACOB.]

* ISABEL II. (MARIA ISABEL LUISA), Queen of Spain, was born on the 10th of October 1830, in the city of Madrid. She is the elder of the two daughters of Ferdinand VII., king of Spain, by his fourth wife, Maria-Christina, now the wife of Don Fernando Muñoz, duke of Riansares. Isabel II. is the eighth in lineal descent from Henry IV., king of France, through her father, and is likewise the eighth in descent from him through her mother. She succeeded to the crown of Spain on the death of her father, September 29, 1833, according to the order of succession established by a decree, March 29, 1830, confirmed by the cortes, which set aside the Salic law, by which females were excluded from the throne of Spain. She was proclaimed Queen of Spain, October 2, 1833, at Madrid, and was placed under the guardianship of her mother, who, by the will of Ferdinand VII., became queen-regent (reina gobernadora) during the minority of her daughter.

On the 20th of June 1833, while Ferdinand VII. was lying ill, the cortes, in accordance with a requisition from the prime-minister, Zea Bermudez, met at Madrid, and took the oath of allegiance to the Infanta Doña Maria Isabel, as rightful successor to the crown of Spain, in default of a male heir. Don Carlos however, the king's brother, who had the right of succession according to the Salic law, having been also required to take the oath of allegiance, refused, and wrote a letter to the king, in which he said, "God gave me that right when it was his will that I should come into the world, and God alone can deprive me of it by giving thee a male heir." Don Carlos persisted in the assertion of his claim to the crown of Spain, and the consequence was a civil war, which lasted till September 1840, when the adherents of Don Carlos were finally defeated, and he was obliged to quit the kingdom. The queen-regent, in consequence of a successful conspiracy, August 18, 1836, was for a time deprived of her power, but having taken an oath, June 18, 1837, to observe the liberal constitution, she regained her authority, and continued in power till another insurrection occurred, in consequence of her interference with the popular rights of election of the town-councils (ayuntamientos), when she was compelled to abdicate, October 12, 1840, and retired to France. Espartero was then placed at the head of affairs, and by a decree of the cortes, May 8, 1841, was appointed regent of the kingdom during the remainder of the queen's minority. He continued in power till July 1843, when a combination of parties compelled him to resign and quit the kingdom. The termination of the queen's minority had been fixed for the 10th of October 1844, but, by a decree of the cortes, she was declared to have reached her majority on the 8th of November 1843, and she took the oath to observe the constitution on the 10th of the same month. On the 10th of October 1846, Queen Isabel II. was married to her cousin, Don Francisco de Assis (born May 13, 1822), the elder son of her maternal uncle. The queen's younger sister, Maria Luisa Fernanda (born January 30, 1832), was married on the same day to the Duc de Montpensier (born July 21, 1824), the youngest son of the late Louis-Philippe, king of France. The queen's husband received the honorary title of king (rey). On the 20th of December 1851 the queen gave birth to a daughter, the present Princess of Asturias, and Infanta of Spain. Another insurrection compelled the queen-mother again to quit the kingdom, July 17, 1854. Espartero was recalled to power, and continued to be the prime-minister till July 14, 1856, when, in consequence of a ministerial crisis, he tendered his resignation, and was succeeded by General O'Donnell. An insurrection ensued, which was speedily suppressed, and O'Donnell remained in power till he was superseded by Narvaez, October 11, 1856.

ISABELLA OF CASTILE. [COLUMBUS; FERDINAND V.]

ISABEY, JEAN-BAPTISTE, an eminent French miniature painter, was born at Nancy on the 11th of April 1767. Having received elementary instruction in art under Claudot and Dumont, he, in 1790, entered the atelier of David, with a view to becoming an historical painter. But he commenced his professional career by taking portraits in black crayons, a style which in his hands, by a free use of the stump, produced very pleasing effects; and becoming extremely popular, was usually called by his name. One of his most successful pieces in this manner was a portrait of Napoleon I. in the garden of Malmaison, the engraving from which, by Lingé, had a great run. This style was however soon abandoned by Isabey, who, having resolved to try whether, by carrying the principles of high art into miniature-painting, he could not elevate that branch of art in public estimation, executed in 1802 a piece of unusual size, containing numerous small figures, of 'Le Revue de premier Consul dans la cour des Tuilleries.' It caught the public taste, and established the painter's reputation, as the first in his line. From that time Isabey was the most fashionable miniature-painter of the day. Whilst Napoleon I. was a plain officer of artillery, Isabey had been on terms of friendship with him, and when the empire was founded Isabey continued in favour, and was appointed miniature-painter in ordinary to the emperor. In this capacity he painted many miniature-portraits of Napoleon I., the empress, the young king of Rome his son, the members of the Bonaparte family, and the favourite courtiers and generals. Among the most famous of the imperial pictures was one on a large slab of porcelain, representing Napoleon I. and the most illustrious of his generals, and known as the 'Table des Maréchaux.' Besides the portraits, he executed several court and ceremonial pieces, one of which, a 'Visite de l'Empereur à la Manufacture d'Oberkampf à Gouy,' was greatly admired. He was likewise entrusted with the direction of works relative to the coronation of the emperor, when he was named officer of the Legion of Honour.

On the first abdication of Napoleon I., Isabey accompanied the empress Marie Louise to Vienna, where he painted a large tablet of 'One of the Conferences at the Congress of Vienna,' chiefly remarkable for the faithful likenesses of the numerous important personages assembled. On Napoleon's return from Elba, Isabey repaired to Paris, and propitiated the emperor by presenting him with a miniature of his son, which he had just painted at Vienna. The restoration of the Bourbons brought no loss of fortune to Isabey; but a picture which he exhibited at the Salon in 1817 of 'A Child playing with Flowers,' caused some 'sensation' among the Parisians, from the child, who was holding up a bunch of forget-me-nots, bearing a striking resemblance to the young Napoleon. The 'Constitutionnel' having ventured to make a pointed allusion to the likeness, received a warning from the police. Isabey soon after accepted an invitation to the court of St. Petersburg, where he painted the emperor Alexander, the empress, the grand-dukes Nicholas and Michael, and many of the magnates of the court. On his return to Paris he painted the portrait of Louis XVIII., and as long as he continued to paint he found ample occupation; his sitters, it is said, having included most of the sovereigns, as well as a large proportion of the most distinguished personages, of Europe. Isabey survived till the 18th of April 1855. He may be said to have formed a new school of miniature-painters in France. His likenesses have much character, and are generally esteemed faithful. His style is marked by force as well as delicacy, but, almost necessarily from the numberless works he executed, also by a good deal of mannerism.

ISABEY, EUGÈNE-LOUIS-GABRIEL, son of the preceding, and who has attained scarcely less distinction as a marine-painter than his father did as a miniature-painter, was born at Paris on the 22nd of July 1804. Carefully instructed under the superintendence of his father, his first works showed the hand of a finished artist. In 1824, and again in 1826, he received the first-class medal (genre et marine); and his pictures exhibited at the Salon in 1827, the 'Plage d'Honfleur,' and 'Vue Intérieure du Port de Trouville' (purchased by the Duchesse de Berri), at once placed him, in the estimation of the Parisians, in rivalry with their favourite Gudin. Among the more important of his subsequent works may be named, 'Ouragan devant Dieppe,' 'Port de Dunkerque' (1831); 'Vieilles Barques' (1836); the 'Combat du Texel' (1839), now in the museum at Versailles; 'Veu de Boulogne' (1843), now in the museum of Toulouse; 'Louis Philippe recevant la Reine Victoria au Tréport,' and 'Le Départ de la Reine d'Angleterre' (1845), both painted for the citizen king; 'Cérémonie dans l'Église de Delft' (1847); 'L'Embarquement de Ruyter' (1851), now in the Luxembourg; and several views of French ports.

The earlier pictures of Isabey are careful in drawing and execution, but somewhat sombre in colour. His later works—the critics dating his change of style from about 1840—are bolder in design, and more vigorous in execution, but far more conventional. He affects a rough mode of handling, strong impasto, and great exaggeration of chiaroscuro and colour. Eugène Isabey was nominated a Chevalier of the Legion of Honour in 1832, and an officer of that order in 1852. At the Universal Exposition of 1855 he was awarded a first-class medal.

ISÆUS, one of the ten Athenian orators, was a native of Chalcis, or, according to other accounts, of Athens. Dionysius could not ascertain the time of his birth or death. So much as this appears certain: the vigour of his talent belonged to the period after the

Peloponnesian war, and he lived to see the time of King Philip. Hermippus, who wrote the lives of the pupils of Isocrates, has recorded nothing more of Isæus than that he was a pupil of Isocrates, instructed Demosthenes, and enjoyed the society of the chief philosophers of his time.

The author of the 'Life of Isæus,' attributed to Plutarch, mentions sixty-four orations of Isæus, fifty of which were allowed to be genuine. At present there are only eleven extant, all of which are of the forensic class (*λόγος δικαστικός*), and all treat of matters relating to wills and the succession to the property of testators, or persons intestate, or to disputes originating in such matters. These orations are valuable for the insight which they give us into the laws of Athens as to the disposition of property by will, and in cases of intestacy, and also as to many of the forms of procedure. Dionysius, in his laboured comparison between Lysias and Isæus, sums up as follows:—"In reading Lysias one would not suppose that anything is said either in an artificial manner or without perfect sincerity, but everything appears natural and true; thus forgetting that it is the height of art to imitate nature. In reading Isæus one has just the contrary feeling; nothing appears to be spoken naturally and without an effort, not even what really is so spoken; but everything seems of set purpose, framed to deceive, or for some other sinister end. One would believe Lysias, though he were stating what was false; one cannot, without some feeling of distrust, assent to Isæus, even when he speaks the truth." Again:—"Lysias seems to aim at truth, but Isæus to follow art: the one strives to please, the other to produce effect."

Dionysius adds that, in his opinion, with Isæus originated that vigour and energy of style which his pupil Demosthenes carried to perfection. So far as the extant specimens of Isæus enable us to form an opinion, this judgment appears to be just. The perspicuity and the artless simplicity of the style of Lysias are admirable; but on reading Isæus we feel that we have to do with a subtle disputant and a close reasoner, whose arguments are strong and pointed, but have too much the appearance of studied effect, and for that reason often fail to convince.

The best editions of the text of Isæus are those by Bekker and Schöman. The oration on the 'Inheritance of Menecles' was first published by Tyrwhitt, London, 1785; and that on the 'Inheritance of Cleonymus' first appeared in its complete form at Milan, 1815, by Ang. Mai. The translation of Isæus by Sir William Jones (1779, 4to) will give an English reader a sufficient notion of this orator; but the translation is somewhat deficient in critical accuracy, and also wanting in force.

ISAIAH, one of the greatest of the Hebrew prophets, lived during the reigns of Uzziah, Jotham, Ahaz, and Hezekiah (Is. i. 1; vii. 1; xiv. 28; xxii.; xxxvi.-xxxviii.), and was contemporary with the prophets Amos, Hosea, Joel, and Micah. We possess no particulars in the Old Testament respecting the place of his birth or his history; but we learn from the inscription of the book that he was the son of Amos, who was, according to one Jewish tradition, the brother of Amaziah, king of Judah; but according to another was considered to be the same person as the prophet Amos. The latter tradition is evidently wrong; since the name of the prophet is *ישעיהו*, while the name of the father of Isaiah is *אמון*. It is probable, from the 6th chapter of the book, that Isaiah entered upon his prophetic office in the last year of the reign of king Uzziah, B.C. 759. He continued to prophesy at least till the fourteenth year of the reign of Hezekiah, B.C. 718 (2 Kings, xix. 2-7; Is. xxxvi.-xxxviii.), a period of forty-six years. According to an ancient Jewish tradition, which is also given in the apocryphal book of the 'Ascension of Isaiah,' he was put to death during the reign of the cruel Manasseh (2 Kings, xxi. 16); who is said by Josephus ('Antiq.' x. 3, § 1) to have slain all the prophets in Jerusalem. Manasseh commenced his reign B.C. 697; and Isaiah must therefore have continued to prophesy for sixty-two years at least, if this tradition be correct. Isaiah had a greater influence in public affairs than any other prophet, except Elijah and Elisha. He appears to have been the intimate friend of Hezekiah; and it was principally owing to his advice and firmness that the army of Sennacherib was defeated.

The prophecies of Isaiah consist of sixty-six chapters, all of which were considered, till within the last fifty years, to have been composed by the prophet himself. But it is the common opinion of the critics in Germany usually called Rationalists, that the book of Isaiah is a collection of prophecies delivered by different persons, which were collected and arranged in their present form during the Babylonian exile. The whole of the latter part of the book, from ch. xl. to ch. lvi., is supposed to have been written at Babylon during the exile, and a considerable part of the first thirty-nine chapters is attributed to other authors than Isaiah. Some critics have called the book a "poetical anthology." This opinion was first maintained by Koppe, and has been supported by Döderlein, Justi, Eichhorn, Eauer, Paulus, Rosenmüller, Bertholdt, De Wette, Augusti, and at great length by Gesenius in his translation of Isaiah, Leip., 1821-29. The best arguments in defence of the common opinion are given by Jahn in his 'Introduction to the Bible,' by Professor Lee in his 'Sermons and Dissertations on the Study of the Scriptures,' and by Hengstenberg in his 'Christologie des alten Testaments,' Berl., 1829-35.

If we admit Isaiah to have been the author of the book which bears

his name, it is nearly certain that the prophecies are not arranged at present in the order in which they were delivered. The sixth chapter apparently contains an account of the inauguration of the prophet in his sacred office, and appears to have been the first prophecy that was published by him. The twenty-second chapter consists of two separate parts which have no connection with each other, and were probably published at different times; the former half of the chapter (1-14) containing a prediction of the invasion of the Medes and Persians, while the latter half gives an account of the disgrace of a courtier of the name of Shebna during the reign of Hezekiah. It is therefore difficult to give any connected account of the contents of the book; but the following arrangement, taken from Gesenius, is perhaps the best upon the whole.

The first part (i.-xii.) principally consists of prophecies relating immediately to the Jewish people; the second part (xiii.-xxxiii.) contains predictions against the Babylonians, Assyrians, Philistines, Moabites, Syrians, Egyptians, and other foreign nations; the third part (xxiv.-xxxv.), with an historical appendix (xxxvi.-xxxviii.), containing an account of the invasion of Sennacherib, contains prophecies of the invasion of Judæa by the Babylonians, of the destruction of Jerusalem, the captivity of the people, and their final restoration to their native country; the fourth part (xl.-lxvi.) principally refers to the restoration of the church; it contains many prophecies respecting the deliverance of the Jews from captivity, the destruction of idols, the spread of the true religion over the earth, the conversion of the Gentiles, and the coming of the Messiah.

The prophecies of Isaiah have always been held in great veneration by the Jews. Jesus, the son of Sirach, speaks of Isaiah as "a prophet great and faithful in his vision, who saw by an excellent spirit what should come to pass at the last, and comforted them that mourned in Sion. He showed what should come to pass for ever, and secret things before they came." (Ecclesiasticus, xlviii. 22-25.) Josephus and Philo frequently speak of Isaiah in terms of the greatest respect; and his prophecies are constantly quoted by the writers of the New Testament. See Matt. i. 22, 23, compared with Is. vii. 14; Matt. iii. 3, with Is. xl. 3; Matt. iv. 14-16, with Is. i. 1, 2; xlii. 7; Matt. viii. 17, with Is. liii. 4; Matt. xiii. 14, 15, with Is. vi. 9, 10; Matt. xxi. 13, with Is. lvi. 7; Luke, iv. 17-19, with Is. lxi. 1-3; Acts, xiii. 34, with Is. lv. 3; Acts, xxviii. 25-27, with Is. vi. 9, 10; Rom. ix. 27, 28, with Is. x. 22; Rom. ix. 29, with Is. i. 9; Rom. ix. 33, with Is. viii. 14; Rom. x. 16, with Is. liii. 1; Rom. x. 20, 21, with Is. lvi. 1, 2; 1 Cor. i. 19, 20, with Is. xlv. 25; 2 Peter, iii. 13, with Is. lxx. 17.

A considerable part of the prophecies of Isaiah are supposed by most Christian divines to relate to the Messiah. The following list is taken from Gray's 'Key to the Old Testament,' pp. 369, 370; the divine character of Christ (vii. 14; ix. 6; xxxv. 4; xl. 5, 9, 10; xlii. 6-8; lxi. 1; lxii. 11; lxiii. 1-4); his miracles (xxv. 5, 8); his peculiar qualities and virtues (ix. 2, 3; xl. 11; xliii. 1-3); his rejection (vi. 9-12; viii. 14, 16; liii. 3); his sufferings for the sins of man (liii. 4-11); his death, burial (liii. 8, 9), and victory over death (xxv. 8; liii. 10-12); his final glory (xlix. 7, 22, 23; li. 13-15; liii. 4, 5), and the establishment, increase (ii. 2-4; ix. 7; xlii. 4; xlv. 13), and perfection (ix. 2-7; xl. 4-10; xvi. 5; xxix. 18-24; xxxii. 1; xl. 4, 5; xlix. 9-13; li. 3-6; lii. 6-10; lvi. 1-3; lix. 16-21; lx. 1; lxi. 1-5; lxx. 25) of his kingdom. The number of Isaiah's prophecies relating to the Messiah was thought by Jerome to be so numerous and important, that he says, in his preface to the book, that Isaiah ought rather to be called an Evangelist than a prophet; and many modern commentators give him the title of the Evangelical Prophet.

The style of Isaiah is said by Lowth ('Prælect.,' xxi.) "to abound in such transcendent excellencies, that he may be properly said to afford the most perfect model of the prophetic poetry. He is at once elegant and sublime, forcible and ornamented; he unites energy with copiousness, and dignity with variety. In his sentiments there is uncommon elevation and majesty; in his imagery the utmost propriety, elegance, dignity, and diversity; in his language, uncommon beauty and energy; and notwithstanding the obscurity of his subjects a surprising degree of clearness and simplicity. To these we may add that there is such sweetness in the poetical composition of his sentences, whether it proceed from art or genius, that if the Hebrew poetry at present is possessed of any remains of its native grace and harmony, we shall chiefly find them in the writings of Isaiah."

In addition to the book of prophecies, Isaiah is also said to have written the lives of Uzziah (2 Chron. xxvi. 22) and Hezekiah (2 Chron. xxxii. 32). The former work is entirely lost; but we probably possess the greater part, if not the whole, of the latter in chapters xxxvi.-xxxviii. of his prophecies.

We learn from the Fathers that several apocryphal works which were in circulation in the early ages of the Christian era, were attributed to Isaiah. An Ethiopic translation of one of these works entitled the 'Ascension of Isaiah,' which was originally written in Greek, and is quoted by Epiphanius ('Hæreses,' xl. 2) and Jerome ('Commentary upon Is. lxxiv. 4'), was published for the first time by Dr. Laurence, Ox. 1819, 8vo. This work contains an account of the prophet's ascension through the firmament and the six heavens into the seventh, and also of his martyrdom during the reign of Manasseh.

(The Introductions of Eichhorn, Jahn, de Wette, Augusti, and Horne; Vitring, *Commentarius in Librum Proph. Isaia*, 2 vols. fol. 1714-1720; Lowth, *Isaiah*, Lond. 1778, frequently reprinted; there is a good German translation of this work with many additions by Koppe, 4 vols. 1779-1781; Döderlein, *Isaia*, 8vo, 3rd. ed., 1789, with excellent notes; Rosenmüller, *Solia*; Gesenius, *Der Prophet Jesaia übersetzt und mit einem vollständigen philologisch-critischen und historischen Commentar begleitet*, Leip. 1821-29, &c.)

ISIDORE of Charax lived probably in the 1st century of our era. It appears from Athenæus ('Deip.' iii.) that he wrote an account of the Parthian empire, of which there is only a small part extant, entitled the 'Parthian Halting-places.' This work gives a list of the eighteen provinces into which the Parthian empire was divided, with the principal places in each province, and the distances between each town. This list was probably taken from official records, such as appear, from the list of provinces, &c., in Herodotus, to have been kept in the ancient Persian empire.

The 'Parthian Halting-places' has been printed in the second volume of Hudson's 'Geographia veteris Scriptorum Græci Minores,' with a dissertation by Dodwell; and in the collections of the minor geographers by Hoeschel (1600) and Miller (1839). There is also a 'Mémoire' on Isidore by Sainte-Croix in the 50th volume of the 'Académie des Belles-Lettres;' and some remarks on the 'Parthian Halting-places' in the 'Journal of Education,' vol. ii. p. 305, where the question of the site of Ecbatana is discussed and determined.

ISIDORE, SAINT, of Pelusium in Egypt, lived in the first half of the 5th century, and wrote, according to Suidas ('Isidorus') "3000 epistles, explaining the divine Scriptures." Upwards of 2000 are still extant; they are for the most part very short, and contain many repetitions. They have been published in Greek and Latin by Scholt, Paris, 1638. Dr. Heumann has published a 'Dissertation on Isidore' (Hanover, 1738, 4to), in which he argues that most of the letters are fictitious, and not a real correspondence.

ISIDORE, SAINT, Bishop of Seville, in Spain, from 595 or 596 to 636, one of the most celebrated of the Spanish bishops, was born at Cartagena. He was well acquainted with Greek and Hebrew, and was considered by the council of Toledo (650) as the most learned man of his age. The style of his works is however not very clear, and his judgment appears to have been very defective.

The most important of his works are—'A Chronicle from the Beginning of the World to A.D. 626;' 'A Book of Ecclesiastical Writers,' in 33 chapters; 'Three Books of Opinions, selected from the Writings of the Fathers, and especially from St. Gregory;' 'Commentaries upon the Historical Books of the Old Testament;' 'Allegories on the Old and New Testaments;' 'Two Books of Ecclesiastical Duties,' printed in the 'De divinis Catholicæ Ecclesiæ Officiis ac Ministeriis,' Cologne, 1568; 'A Book of Prolegomena to the Old and New Testaments;' 'Twenty Books of Origines or Etymologies,' which were left unfinished, and were published after his death by Braulio, bishop of Saragoza; the first edition of this work was published at Augsburg, 1472.

The works of Isidore have been published by Du Breul, Paris, 1601, and Cologne, 1617; at Madrid, 1778; and by Arevali, Rome, 1797-1803.

ISMAEL, from whom originated the ISMAELITES, or ISMAELIANS, originally a branch of the Shiites, or followers of ALI BEN ABI TALEB, was the elder son of Djafar Madeck, the sixth Imaum in a direct line from Ali. On the death of Ismael, Djafar Madeck appointed his younger son Mousa to be his successor. This caused a schism among the Shiites in the second century of the Hegira. Those who contended that the office of Imaum ought to have descended to the posterity of Ismael, and not to his younger brother, were called Ismaelites, and also Karmathi and Batenis; in Persia they were called Talimis, from the word Talimi, which means 'learning,' because they maintained, contrary to the orthodox Mussulmans, that man can learn the truth only by studying. They established two powerful dynasties, one in Egypt (FATIMIDES), and another in the Irak Ajemi, a part of Persia, the capital of which was Casbin. The Assassins of Persia and Syria were a fanatical sect of Ismaelites. The Ismaelites of Persia, Syria, and Arabia had frequent wars against the Abbassid kalifs and the other Sunnee Mussulmans, until the dynasty of Casbin was overthrown by the Tartars about the middle of the 13th century. After that time the Ismaelites became scattered through Asia, maintaining their tenets, and observing their rites in concealment and obscurity. Their tenets appear to have been of a loose kind; they were the free-thinkers of Mohammedanism. At the end of the last century they were still existing in Persia, and had their Imaum at Khakh, a village in the district of Khom, enjoying the protection of the shah, although considered as heretics by the Persian Shiites. They had followers even in India. (J. F. Rousseau, 'Mémoire sur les Ismaélites et les Nosairis,' with notes by De Saey.) Those of Syria have continued to live in the mountains of Semmak, which join Lebanon, and their chief place was Maszyad, near Hamah, on the Orontes. The Druses are supposed by some to be a ramification of the old Ismaelites, but they are a distinct people, both in their religious and social character, from the present Ismaelians. In 1809 the Nosairis, another sect living in the same mountainous tract, took Maszyad by surprise, murdered the emir, with most of the Ismaelian inhabitants, and carried off a

large booty. The Ismaelians of Syria have never recovered from that blow, but have remained poor in importance and numbers, and are under the nominal dominion of the Turks. Their tenets are not well known, but they seem to have deviated from the original doctrines of the great Ismaelite sect, and to have mixed them up with gross superstitions. They can hardly be called Mussulmans; they have no mosques, but are circumcised, and they still visit the tomb of Ali at Mebed. They are said to be simple and hospitable, and have a better reputation than their neighbours the Nosairis.

ISOCRATES, one of the Greek orators commonly called the Ten, was born at Athens B.C. 436. He studied rhetoric under Prodicus, Gorgias, Tisias, and Theramenes, and became a master of his art. A certain timidity and feebleness in his delivery prevented him from speaking in public ('Panathenæus,' c. 4), and he was therefore debarred from occupying the high stations which were open to the ambition of his contemporaries. He taught rhetoric both at Chios and at Athens, and his school was attended by numerous disciples, among whom were Xenophon, Ephorus, Theopompus, and other distinguished men of his time. Although no orator himself, he formed many orators; and Isæus, Demosthenes, and others, are said to have studied under him. He is said to have charged one thousand drachmæ for a complete course of oratorical instruction, and to have said to some one who observed on the largeness of the amount, that he would willingly give ten thousand drachmæ to any one who should impart to him the self-confidence and the command of voice requisite in a public orator. The orations of Isocrates were either sent to the persons to whom they were addressed for their private perusal, or they were entrusted to others to deliver in public. He is said to have delivered only one himself.

Isocrates treated of great moral and political questions: his views are distinguished by a regard for virtue, and an aversion to all meanness and injustice. His politics were conciliatory; he was a friend of peace; he repeatedly exhorted the Greeks to concord among themselves, and to turn their arms against their common enemy Persia. In his 'Panegyric Oration' (published about B.C. 379), which he wrote in the time of the Lacedæmonian ascendancy, he exhorted the Lacedæmonians and Athenians to vie with each other in a noble emulation, and to unite their forces in an expedition against Asia; and he decried eloquently on the merits and glories of the Athenian Commonwealth, on the services it had rendered to Greece, and on its high intellectual cultivation; while he defended it from the charges, urged by its enemies, of tyranny by sea, and of oppression towards its colonies. He addressed Philip of Macedon in a similar strain after his peace with Athens (B.C. 346), exhorting him to reconcile the states of Greece, and to unite their forces against Persia. He kept up a correspondence with Philip, and two of his epistles to that prince are still extant, as well as one which he wrote to the then youthful Alexander, congratulating him on his proficiency in his studies. But although Isocrates was of a mild and conciliatory disposition, he displayed considerable courage on several occasions, as when he showed his sympathy for Theramenes, who had been condemned by the thirty tyrants; and lastly, he proved that though no violent partisan, he was a warm-hearted patriot, when, at the news of the battle of Chæronea, he refused to take food for several days, and thus closed his long and honourable career at ninety-eight years of age, B.C. 338.

There are extant eight orations of Isocrates of the class called judicial, or forensic (*λόγοι δικαστικοί*), which are valuable for the subject matter. In his oration in favour of the Plataeans he took the part of that people, who were expelled from their homes by the Thebans. The oration against Kuthynous, which appears to be incomplete, and may possibly never have been spoken, is a most ingenious attempt to determine a dispute as to the restoration of a deposit of money where there was an absence of all direct testimony as to the main fact. The orator puts the probabilities on each side in two opposite scales, and weighs them with consummate skill. Three of the orations of Isocrates—to Demonicus, to Nicocles, and the oration entitled Nicocles, belong to the Panænetic or hortatory class, and the first two partake in some degree of the epistolary style. Isocrates' 'Panathenæus' is a panegyric of Athens, which he wrote when he was ninety-four years of age. ('Panath.,' c. 1.)

The style of Isocrates is singularly perspicuous, but highly laboured and somewhat diffuse. In Cicero's opinion it was he who first gave to prose writing its due rhythm. The art of Isocrates is always apparent, a circumstance which of itself diminishes in some degree the effect of his writings, and is almost inconsistent with vigour and force. The oration to Demonicus is an almost uninterrupted series of antitheses. Isocrates though he falls far below the great orator of Athens, is still a perfect master in the style which he has adopted, and has well merited the high encomium of Dionysius for the noble spirit and the rectitude of purpose which pervade his writings. This judicious critic has thus briefly summed up his comparison between Lysias and Isocrates. "As to the charm of composition, Lysias is superior to Isocrates in the same kind that a naturally handsome person is to one made so by art: the composition of Lysias pleases naturally; that of Isocrates aims at pleasing." Plutarch says that sixty orations went under the name of Isocrates, of which only twenty-five or twenty-eight at most were his; twenty-one of these have come down to us, together with a few epistles, probably not genuine. 'Isocratis Opera,'

Greek and Latin, were edited by the Abbé Auger, 3 vols. 4to, Paris, 1782, with several biographies of Isocrates: this edition is of small value. The best edition of the Greek text is by Bekker; the edition of Koray, Paris, 1807, 2 vols. 8vo, is useful. Isocrates was translated into English by Richard Saddleir, London, folio (no date); by Dunsdale, London, 1752, 8vo; and by Gillies, together with the Orations of Lysias, London, 1778, 4to.

(Dionysius of Halicarnassus; *Life of Isocrates*, attributed to Plutarch; Cicero, *De Claris Oratoribus*, c. 8; Quintilian, *Instit.*, iii. x., &c.; Photius, *G.* 260.)

IVORY, JAMES, a distinguished British mathematician, was born at Dundee, in 1765, and received the rudiments of education in the public schools of that town. At fourteen years of age he was sent to the University of St. Andrews; his father, who was a watchmaker, intending that he should become a clergyman of the church of Scotland. In that university the young man remained six years, during four of which he was occupied with the study of mathematics, languages, and philosophy; but the first of these subjects, from a natural inclination to that branch of science, particularly engaged his attention: he was encouraged and ably assisted in his favourite pursuit by the Rev. John West, one of the instructors at the university; and his great progress, which is said to have excited considerable notice, gave already indications of the eminence which, as a mathematician, he was afterwards to attain. The two following years were passed in the study of theology; and Mr. Ivory then removed, in company with Mr. (afterwards Sir John) Lealie, who had been his fellow-student at St. Andrews, to the University of Edinburgh, where he spent one year in completing the course of study required as his qualification for admission to the office of minister in the Scottish Church.

It is not stated what circumstances prevented Mr. Ivory from carrying out the intentions of his father in this respect; but, on quitting the university, in 1786, he accepted an appointment as an assistant teacher in an academy then recently established in Dundee, and he continued to fulfil the duties of that post during three years. At the end of that time he engaged with some other persons in the establishment, at Douglstown in Forfarshire, of a factory for spinning flax; and of this association he appears to have been the principal person. During fifteen years (from 1789 to 1804) Mr. Ivory was employed daily in operations apparently very un congenial with the taste of a man of science; but it may be presumed that all his leisure hours were devoted to the prosecution of scientific researches. The undertaking proved unsuccessful, and in 1804 the company ceased to exist. Mr. Ivory then obtained the appointment to a professorship of mathematics in the Royal Military College, and went to reside at Marlow, in Buckinghamshire, where that institution had, a few years previously, been formed. On the removal of the college to Sandhurst, in Berkshire, Mr. Ivory accompanied it to the latter place, where he remained till his retirement from public service. He fulfilled the duties of his professorship to the great satisfaction of the governor and benefit of the students, his attention to whom was unremitting. An edition of Euclid's 'Elements,' which is known to have been his work, though his name does not appear on the title-page, was prepared by him for the use of the students in the college.

In the beginning of 1819 Mr. Ivory, feeling his health decline under the great exertions which he made in carrying on his scientific researches and performing his duties as a professor, those duties leaving him but short intervals of leisure, was induced to resign his professorship and retire into private life. In consequence of his great merit there was granted to him the pension due to the full period which, by the regulations, the civil officers of the institution are required to serve previously to obtaining such pension; and which period he had not completed. After his retirement from Sandhurst, Mr. Ivory devoted himself wholly to scientific researches, and the results of his labours have been printed chiefly in the volumes of the 'Philosophical Transactions.' In 1831, in consideration of the great talent displayed in his investigations, he was by Lord Brougham, to whom he had been known in early life, recommended to the king (William IV.), who, with the Hanoverian Guelphic Order of Knighthood, gave him an annual pension of 300*l.*, which he enjoyed during the rest of his life; and, in 1836, the University of St. Andrews conferred on him the degree of Doctor in Laws. He lived in great privacy in or near London till his death, September 21st, 1842.

Mr. Ivory's earliest writings were three Memoirs which he communicated in the years 1796, 1799, and 1802 to the Royal Society of Edinburgh: the first of these was entitled 'A New Series for the Rectification of the Ellipse;' the second, 'A new Method of resolving Cubic Equations;' and the third, 'A New and Universal Solution of Kepler's Problem;' all of them evincing great analytical skill, as well as originality of thought. He contributed fifteen papers to the 'Transactions of the Royal Society of London,' nearly all of them relating to physical astronomy, and every one containing mathematical investigations of the most refined nature. The first, which is entitled 'On the Attractions of Homogeneous Ellipsoids,' is in the volume for 1809, and contains investigations of the attractions of such ellipsoids on points situated within them and on their exterior: the former case presents few difficulties; but the process used by Laplace for the solution of the other was very complex, and Mr. Ivory had the merit

of discovering one which is remarkable for its simplicity. A direct investigation of this case has since been given by M. Poisson.

In the volumes for 1812 and 1822 there are three papers on the 'Attractions of Spheroids,' in which Mr. Ivory substituted a refined analytical process for the indirect method of Laplace; the papers contain also some observations on the method employed by that great geometer in computing the attractions of spheroids of any form differing but little from spheres. The analytical skill shown by Mr. Ivory in these papers was frankly acknowledged by Laplace himself in a conversation which, in 1826, he had with Sir Humphry Davy.

The 'Transactions' for 1814 contain an investigation by Ivory relating to the orbits of comets, on the supposition that these orbits are parabolical: the paper is entitled 'A New Method of Deducing a First Approximation to the Orbit of a Comet from three Geocentric Observations.' And the volumes for 1823 and 1833 contain his investigations relating to Astronomical Refractions: in the first of these the temperature of the air is supposed to decrease uniformly with a uniform increase of height; and in the other the expressions are rendered general for all laws of temperature. The volumes for 1824, 1831, 1834, and 1839, contain each a paper on the equilibrium of fluid bodies; and in the volume for 1838 Mr. Ivory demonstrated that a homogeneous ellipsoid with three unequal axes may be in equilibrium when revolving about one of the axes: he also examined in detail the limitations of the proportions of the axes. The subject of planetary perturbations is treated by him in two papers which are contained in the volumes for 1832 and 1833; in the first he has simplified the theory of the variations of the elements, and in the other

he has given some facilities for developing the eccentricities and inclinations. He has given in the 'Transactions' only one paper which is purely mathematical, and this is contained in the volume for 1831; it is entitled 'On the Theory of Elliptic Transcendents.' Mr. Ivory likewise contributed several valuable papers to the 'Philosophical Magazine,' 1821-27. Several valuable communications from his pen are contained in Maseres's 'Scriptores Logarithmici;' in Leybourn's 'Mathematical Repository;' and in the Supplement to the sixth edition of the 'Encyclopædia Britannica.'

In estimating the merits of Mr. Ivory as a mathematician, it must be borne in mind that his researches were conducted by a most refined analysis at the time when even the notation of the differential calculus was not familiar to the English mathematicians; and that, when he wrote the papers relating to the attraction of spheroids, the volume of the 'Mécanique Céleste,' in which that subject is treated, had probably not been read by any person in this country except himself.

In 1815 Mr. Ivory was elected a Fellow of the Royal Society of London. He was also an honorary fellow of the Royal Society of Edinburgh; an honorary member of the Royal Irish Academy, and of the Cambridge Philosophical Society; a corresponding member of the Institute of France, of the Royal Academy of Sciences of Berlin, and of the Royal Society of Göttingen. He received in 1814 the Copley medal for his mathematical communications to the Royal Society; in 1826 one of the royal medals was awarded to him for his paper on 'Astronomical Refractions,' published in 1823; and in 1839 he received another royal medal for his 'Theory of Astronomical Refractions,' which was published in 1838.

J

JABLONSKI, PAUL ERNEST, the son of Daniel Ernest Jablonski, a distinguished minister of the Protestant Church, was born at Berlin in 1693. He was educated at the University of Frankfurt-on-the-Oder, where he applied himself with great diligence and success to the study of the Coptic and other oriental languages. At the age of twenty-one he was sent at the expense of the Prussian government to the various public libraries in Europe, in order to pursue his studies and to make extracts from Coptic manuscripts. In 1720 he was appointed minister of the Protestant church at Liebanberg, and in 1722 professor of theology at Frankfurt-on-the-Oder, and also minister of the Protestant church in the same place. He died on the 13th of September 1757.

The most important of Jablonski's works are:—'Pantheon Ægyptiorum, sive de Diis eorum Commentarius, cum Prolegomenis de Religione et Theologia Ægyptiorum,' 3 vols. 8vo, 1750-52; 'De Memnone Græcorum et Ægyptiorum, hujusque celeberrima in Thebæide Statua,' 4to, 1753; 'Remphah Ægyptiorum Deus ab Israëlitis in Deserto cultus,' 8vo, 1751; 'Dissertationes Academicæ de terra Gosen,' 4to, 1755-56; 'Disquisitio de Lingua Lycaonica' (which is mentioned in the 'Acts of the Apostles,' xiv. 11), 4to, 1714-24; 'Exercitatio Historico Theologica de Nestorianismo,' 8vo, 1724; 'De ultimis Pauli Apostoli Laboribus a Luca prætermisissis,' 4to, 1746; 'Institutiones Historiæ Christianæ Antiquioris,' 8vo, 1754; 'Institutiones Historiæ Christianæ recentioris,' 8vo, 1756. Several of these works have been republished, with many additions and corrections by Te Water, under the title of 'Opuscula quibus Lingua et Antiquitates Ægyptiorum, difficultia Librorum Sacrorum Loca, et Historiæ Ecclesiasticæ Capita illustrantur,' &c., 4 vols. 8vo, Leyden, 1804-13.

JACKSON, ANDREW, American general and president, was himself a native of the United States; although his father, of the same name, was an Irishman, the youngest of the four sons of Hugh Jackson, a linendraper near Carrickfergus; and either the linendraper himself, or one of his recent progenitors, had come over from Scotland. Andrew Jackson went over to America in 1765, taking with him a wife and two sons. With them he established himself in the Waxhaw settlement in South Carolina; and here his third and youngest son, the subject of the present notice, was born on the 15th of March 1767. Andrew Jackson died five days after the birth of his son; and his widow found herself left with a half-cleared farm, without slaves, whereupon to bring up her three sons.

Andrew, her latest born, appears to have been his mother's favourite; and the original destination of the future general and president of the United States was to be a clergyman. With this view, after having finished his school education, he was sent to the Waxhaw Academy; and here he seems to have studied theology for some years. When the War of Independence however made all Americans soldiers, the young Jacksons did not hold back. His eldest brother was killed at Stono. Andrew is recorded to have fought, along with his next eldest brother Robert, under Sumter in his attack on the British garrison at Rocky Mount, on the 6th of August 1780; at which date he would be little more than thirteen. And from this time he is stated to have taken a part in the campaigns as long as the war lasted. Nor did he escape the usual dissipated habits of a military life; but, with the decision of character which was his most remarkable characteristic, he suddenly changed his course before it was too late, and, collecting what remained of his means, put himself, in the winter of 1784, into

the hands of Spruce McCay, Esq., an eminent advocate and afterwards a judge, to be instructed in the practice of the law. This new study he prosecuted with so much success, that in 1787 he was appointed solicitor for what was then called the Western District of North Carolina, and is now the State of Tennessee. The circumstances of the time however did not suffer him, even if he had been so inclined, to throw off his military character, or to let the experience he had gained in camps and campaigns go to rust. Although the war with the mother country was over, the borders of the republican territory were still infested with another most troublesome enemy in the original occupants of the soil; and Jackson, although he would only serve as a private, is said to have so much distinguished himself in the contest with these natural rivals of his race, that he was honoured among them with the titles, or descriptive appellations, of Sharp Knife and Pointed Arrow.

He continued to be thus employed till the year 1796, when, after having first acted as one of the members of the Convention for establishing a constitution for the state of Tennessee, he was, under that new arrangement, elected to a seat in the House of Representatives. The next year he was chosen a senator; but he resigned his seat after holding it for one session. He was then appointed by the legislature of Tennessee judge of the supreme court in that state; having also been shortly before chosen a major-general of the state forces. But he soon resigned his judicial office; and, settling himself on a farm, a few miles from Nashville, on the Cumberland River, he resided there in retirement till the breaking out of the war with England in 1812. With that event commences the most memorable portion of Jackson's career.

His first command was that of a body of between two and three thousand volunteers, who had assembled on his invitation, and with whom he was directed to proceed down the Mississippi for the defence of the lower country. This was in November 1812. The next year he greatly distinguished himself by a campaign against the Creek tribes, who were repeatedly afterwards defeated by him. The war was terminated in August 1814 by a treaty, by which they agreed to lay down their arms.

In 1814 Jackson was appointed a major-general in the service of the United States; and, among other operations, he succeeded in taking Pensacola on the 7th of November, and raised himself to the highest point of reputation and popularity among his countrymen by the repulse of the British forces in their attack on New Orleans, on the 8th of January 1815. The next military command which he held was that of the war against the Seminole Indians of Florida in 1818. Jackson's proceedings in this war, from first to last, were extremely irregular and high-handed; the force at the head of which he placed himself was raised and officered not only without but in direct opposition to the orders of the general government; in carrying on his operations against the Indians, he did not scruple to seize, one after another, several forts and posts belonging to Spain, with which country the United States were at peace, and to put down the Spanish authorities by the power of the sword—conduct of which his government marked its disapproval by the immediate restoration of the places thus unwarrantably seized; but his most extraordinary act was the execution of the two Englishmen, Arbuthnot and Ambrister. Alexander Arbuthnot was taken in the Spanish Fort of St. Mark's, along

with two Indian chiefs, and Robert C. Ambrister, a few days afterwards, on an excursion which the force made from that post to destroy a neighbouring Indian village. The two Indian chiefs were hanged at once, and without trial; the justification urged being that by their own usual practice in like cases, and by the general manner in which they carried on war, the Indian tribes were to be considered as having put themselves beyond the pale of the ordinary law of nations. Arbuthnot and Ambrister were both, after a few days' confinement, tried at St. Mark's by court-martial, when Arbuthnot was sentenced to suffer death, and Ambrister to be whipped and further confined, but General Jackson annulled the latter sentence, and Arbuthnot was hung and Ambrister shot. Jackson's biographers assert that there could be no doubt that these persons were acting in concert with the Indians. But even to take the lives of Indian prisoners of war was an extreme proceeding, and one of very doubtful propriety; the charge upon which the two Englishmen were tried was only the very vague one of "inciting the Indians to war;" in these circumstances it was certainly a startling exercise of military power for a general to set aside the sentence of a court-martial, as was done in the case of Ambrister. But Jackson himself vindicated what he had done, on the ground that Arbuthnot and Ambrister, by assisting in war against the United States while they were at peace with Great Britain, became outlaws and pirates; thus resting their liability to suffer death, when taken prisoners of war, not on the ground of their having united their fates with savages, but on that of their having been the subjects of a power with which the United States were at peace—a principle altogether unknown to the law of nations. However, although a stout fight was made in Congress by the opposite party, Jackson's friends, supported by the feeling out of doors, where his military reputation and his ultra-democratic professions bore down everything, carried a succession of votes in his exculpation by large majorities. The judgment of impartial men will place this among the least defensible class of military executions.

General Jackson afterwards acted as commissioner on the part of the United States in the negotiation with Spain for the transference of Florida; and after the arrangement of the treaty to that effect he was, in 1821, appointed the first governor of the province. He held this post for a year, and was then again elected a member of the senate for the state of Tennessee.

When the election of a new president came on at the end of 1824, General Jackson was a candidate, along with Mr. Adams, Mr. Clay, and Mr. Crawford; and on the first vote he had a large majority over the nearest of his competitors. No candidate however having the majority required by the constitution, the election devolved upon the House of Representatives, and Adams was elected. Jackson however was elected in 1828, and again in 1832; so that he was at the head of the government of his native country for the eight years from 1829 to 1837. His presidency was distinguished by the rapid growth and extension of democratic tendencies of all kinds; and, at the same time, of both the spirit of territorial extension, with its near consequences, conquest, and war, and of the influence of the southern states and the slaveholding interest; but the subject in regard to which the president personally came forward in the most conspicuous manner was in the affair of the United States Bank. This bank, the renewal of the charter of which was the ostensible matter in dispute, was a powerful instrument in the hands of the general government; and hence the renewal of its charter, though supported by both houses of Congress, was resisted, and successfully, both by the popular voice and by the president whom that voice had placed in office, and who had been one of the most hardened and resolute of the democratic leaders throughout his life.

General Jackson survived his presidency about eight years, and died at his seat called the Hermitage, near Nashville, in Tennessee, on Sunday the 8th of June 1845. He was married, but had no issue. A colossal statue has been erected to his memory in President's-square, Washington.

JACKSON, JOHN, R.A., was born in 1778 at Lastingham, in Yorkshire, where his father carried on the business of a tailor, and he was himself bred to the same business. He however hated his occupation; he had seen the collection of Lord Mulgrave, and the pictures at Castle Howard, and he had a strong inclination to become a painter. An attempt which he made to imitate a picture by Reynolds was shown by his schoolmaster to Lord Mulgrave, who perceiving in it and others, notwithstanding their crudeness, some talent, supplied Jackson with proper materials, and encouraged him to go on. Lord Mulgrave and Sir George Beaumont purchased the two years of Jackson's unexpired apprenticeship, and Sir George, in 1797, gave him an allowance of 50*l.* per annum, and an apartment in his house in town, to enable him to prosecute his studies at the Royal Academy.

Jackson soon obtained a name for his portraits in black-lead pencil and water-colours, but it took him many years to equal the successful oil-painters of that day. He first attracted notice in this department about 1806, and in 1817, when he was elected a member of the Royal Academy, his reputation was little inferior to that of Lawrence, though he was comparatively little patronized; his portraits were bold and effective, but they wanted the delicacy of the works of Lawrence. Jackson could paint five heads while Lawrence was painting one. In the summer of 1819 he visited Rome in company with Chantrey, and

painted for him there a portrait of Canova. Jackson astonished the Roman painters, says Cunningham, by copying in four days the Borg-hese Titian of 'Sacred and Profane Love,' as it is called—a picture which many Romans required two or three months to copy; Passavant says, the figure of 'Divine Love,' in three days, which is more likely; the rest of the picture is scarcely worth copying. Jackson was elected a member of the Academy of St. Luke, at Rome. He was in all his works extraordinarily rapid and sure. A story is related, that he commenced and finished in a single summer's day, as a wager, the portraits of five gentlemen: he received 25 guineas for each of them—125 guineas in one day; probably no painter ever earned as much by his own labour before. The story is told by Passavant. Jackson died at his house in St. John's Wood on June 1, 1831. His best works are the portraits of Lady Dover, of Flaxman, and of himself, both painted for Lord Dover, and the portrait already mentioned of Canova. He painted in all the portraits of thirteen of his fellow-academicians, but that of Flaxman is in all respects the best: it is indeed one of the finest portraits in the world.

Jackson exhibited in all, at the Royal Academy, between the years 1804 and 1830, 145 pictures; he of course painted very many portraits that were not exhibited, for he was latterly constantly employed. His nominal price for a head was fifty guineas, and though he must have been making a large income, he died without leaving a provision for his family. He was twice married; his second wife, who survived him, was the daughter of his fellow-academician, Ward.

(Cunningham, *Lives of British Painters, &c.*; Passavant, *Kunstreis durch England, &c.*)

JACKSON, WILLIAM, who alone is almost sufficient to refute the opinion too generally entertained even in this country, that the English have no school of music, was born in 1730, at Exeter, of which place his father was a highly respectable tradesman. He there received a liberal education, and having evinced distinct proofs of musical genius, was placed under the tuition of the organist of the cathedral, but completed his professional studies in London, under the celebrated Travers, of the Chapel-Royal. He returned to and settled in his native city, and in 1777 was appointed sub-chantor, organist, lay-vicar, and master of the choristers of the cathedral.

Jackson first made himself known as a composer by the publication of 'Twelve Songs,' which immediately spread his fame throughout the kingdom. His next work was 'Six Sonatas for the Harpsichord;' but this proved unsuccessful: his power was in vocal music—in giving melodious expression to good lyric poetry, of which he always made a judicious choice. His third work, 'Six Elegies for Three Voices,' completely established his reputation; they are, and will continue to be, admired by all who have a cultivated unprejudiced love of the art. This was followed by his Opera *iv.*, consisting of twelve more songs, among which is, if we mistake not, the very lovely air, 'Go, gentle Gale;' and subsequently he published two other sets of the same number of songs in each, many of which deserve to be rescued from that neglect to which fashion—that is, the rage for novelty—has condemned them. His 'Twelve Canzonets for Two Voices,' all of them more or less ingenious and pleasing, were once the delight of every musical circle. Of these, 'Time has not Thinned my Flowing Hair' has lost none of its charms; and 'Love in thine Eyes for ever Plays' is a duet familiarly known to most, if not all, persons of taste in the British Isles. Of his three dramatic compositions, 'The Lord of the Manor' alone survives. The exquisitely tender air in this, 'Encompass'd in an Angel's Frame,' is one among the many admirable things in the opera; the words by General Burgoyne, who in a preface to the drama pays a well-deserved compliment to the composer.

Jackson of Exeter, as he is usually called, was not only a musician and composer of great originality and grace, but an able, though somewhat caustic, musical critic, and a writer of no ordinary powers. His 'Thirty Letters on Various Subjects,' and his 'Four Ages, together with Essays on Various Subjects,' exhibit a very unusual reach of thought and extent of knowledge, and in them may be found the germs, and sometimes much more than the germs, of much that has gained later writers credit for acuteness and even profundity. He writes in a pleasing and perspicuous style, and the works are in every way of a superior order of merit.

Jackson was no mean proficient in the sister art of painting. He chiefly employed his pencil in landscapes, making his friend Gainsborough his model; and it has been said, perhaps rather hyperbolically, that he occasionally imitated him so well as almost to become a kind of rival. Jackson died in 1803, at the age of seventy-three.

JACOB, the father of the founders of the twelve tribes of Israel, was the son of Isaac and Rebekah, and the younger twin-brother of Esau. "Of all the patriarchs," says Bishop Hall, "none made so little noise in the world as Isaac; none lived either so privately or so innocently." The early events of his life are given under ABRAHAM, and during his father's life the Scriptures relate his characteristic marriage with Rebekah. For twenty years, and until he was sixty years old, he was without issue; but at length, after repeated prayer, his wife gave birth to the hairy Esau and to Jacob in B.C. 1993. Jacob was the mother's favourite, a mild placid lad, giving attention to the flocks and herds of his father; while Esau was a "cunning hunter," and gained Isaac's favour by gifts of venison. Of course Jacob was made aware of the promise to Rebekah that "the eldest should serve the

youngest;" and therefore, taking advantage of Esau's hunger and impetuosity, he obtained from him a formal and solemn relinquishment of his right of seniority for a mess of pottage. It is generally thought that this right, as to which Esau inquired "what profit shall this birthright do to me?" related only to the heirship of the promises relating to the foundation of the future kingdom. Abraham had died when Esau and Jacob were fifteen. Isaac had succeeded to his patrimony, as Abraham had already provided for his sons by his second wife Keturah. He had prospered; but on the occurrence of a famine in Canaan he had thoughts of going down to Egypt, but was forbidden by God. He therefore went to Philistia, and settled at Gerar. Here he denied that Rebekah was his wife, as his father Abraham had done in somewhat similar circumstances; but she was not taken from him, nor was he molested on that account, though Abimelech reproached him for the deception. His prosperity continued to increase, but contentions arose with the herdsmen of Abimelech the king respecting the wells; and Isaac, after one or two removals, finally settled at Beersheba. Here Esau at the age of forty married two wives of the neighbouring tribe of the Hittites, to the great grief of his family, who would naturally wish that he should have united himself with wives of his own race. Isaac was now 137 years old, and imagining himself to be near his end, desired to give his heir his last blessing. This Jacob, by a device of his mother, obtained from the dim-sighted old man, who however said, "the voice is Jacob's voice, but the hands are the hands of Esau." Esau, though he obtained a second but modified blessing, was greatly irritated, and threatened to kill Jacob, who thereupon, by his mother's advice, fled to his mother's brother, Laban, who dwelt in Paduaram in Mesopotamia, first receiving the parting injunctions of father and mother to take no wife from the daughters of Canaan, but to select one of the daughters of Laban. On his journey he had the vision of the ladder that ascended to heaven, at a place afterwards called Bethel. After a long journey he approached the neighbourhood of Laban, where at a well he first saw Rachel, and was enabled to show her courtesy by watering her father's sheep, which she kept. When he had done this he announced himself, and she ran to inform her father. Laban received him kindly, and after Jacob had resided for a month, inquired what wages he should give for his services. Jacob offered to serve him seven years for his younger daughter Rachel, for Laban had an elder daughter Leah. The seven years passed, "and they seemed to him but as a few days, for the love he had to her," and then Jacob claimed his bride. Laban made a feast, the wedding took place, the bride was closely veiled as was and is the custom in the east, and in the morning "behold, it was Leah." Jacob reproached her father for the deception, who pleaded that it was contrary to the custom of the land to marry the younger daughter before the elder; but he agreed to give him Rachel also, after a short interval, on condition that he served another seven years. Jacob consented to this arrangement. Leah was fruitful; she bore Reuben, Simeon, Levi, Judah, Issachar, and Zebulun, and a daughter named Dinah, and her handmaid bore Gad and Asher. Rachel for many years had no issue; she therefore gave her handmaid to Jacob, who bore Dan and Naphtali. At length Rachel's prayers were heard, and when Jacob was ninety-one she bore to him Joseph. When Jacob's term of servitude for Rachel had expired he expressed a wish to return to Canaan with his wives and family, but Laban, whose flocks and herds had prospered under Jacob's care, prayed him to tarry, saying "the Lord hath blessed me for thy sake; appoint me thy wages, and I will give it." Jacob consented, on condition that "all the speckled and spotted cattle, and all the brown cattle among the sheep, and the spotted and speckled among the goats," should be his hire. This was assented to, and by his management he contrived that all the stronger animals should produce young of the description named, while all the weakly ones were Laban's. His remarkable success, and the vast increase of his wealth, excited the envy of Laban's sons, and to avoid the effects of their displeasure he resolved to depart secretly. Laban however pursued and overtook him, but after a short controversy they were reconciled, and Jacob pursued his way to Canaan. When he approached Edom, where Esau was living, he began to fear his brother's resentment, and sent large presents of camels, cattle, and sheep as presents, in order to propitiate him; but Esau received him kindly, "fell on his neck and wept," and returned his presents, saying "I have enough, my brother;" but, finally, at Jacob's urgent request accepting them, and offering to escort him on his way. This was declined. Jacob proceeded, and at length reached the neighbourhood of Shechem, where he purchased a piece of land, and erected an altar. While living here occurred the violation of his daughter Dinah by Shechem, the son of Hamor, the prince of the country; in revenge for which, although Shechem wished to marry her, Simeon and Levi slew Hamor and Shechem and all the males of the city, took their wives and children captives, and spoiled them of their cattle and wealth. Jacob was angry at these violent proceedings, feared retaliation, and was directed by God to remove, which he did to Ephrath, where Rachel died in childbirth of Benjamin. Jacob then resumed his wanderings until he at length came to his father Isaac, at Mamre near Hebron; and sixteen years after Isaac died, aged 180, and was buried by his sons, Jacob and Esau.

While living at Mamre the earlier incidents of the life of Joseph begin, and it will be better to give them in connection with the remaining years of Jacob. On the death of Isaac, Esau probably suc-

ceeded to his share of property as eldest son, no mention being made of any discontent on his part, and he returned to the land of Seir, the separate possessions of Jacob being already very great. The sons of Jacob, except the youngest, were of course employed in tending the flocks and herds, but Joseph, who was the father's favourite, was probably only thus employed occasionally, and "he brought unto his father" the "evil report" of his brethren. This, and the finer dress which had been given him, excited their animosity, which was increased by the relation of Joseph's dreams of the sheaves, and of the sun, moon, and stars, all predicting his supremacy. They therefore, on another visit to them in the fields, bound him into a pit, and sold him to some Midianitish merchants, taking home "the coat of many colours," and informing their father that no doubt his favourite son had been devoured by wild beasts. Joseph was carried to Egypt, became a slave in Potiphar's house, resisted the seductions of Potiphar's wife, was cast into prison, there explained the dreams of the baker and butler of Pharaoh, and was at length sent for to tell and explain the dreams of the Egyptian king. Having done this, foretelling the years of plenty and of famine, he was set over all the land of Egypt as the most fitting person to guard against the evil consequences of the calamities he foresaw. Joseph was at this time thirty years old; his name was changed, and he married a daughter of Poti-pherah, priest of On, by whom he had Manasseh and Ephraim. During the years of plenty he had laid up large stores of corn, and when the years of dearth arrived the corn was sold to the Egyptians and to strangers, for "the famine was sore in all lands," no doubt to the great profit of the king. The famine extended to Canaan, and Jacob was compelled to send his ten sons to buy corn in Egypt, but he retained his youngest and now favourite son Benjamin, the last supposed relic of his beloved Rachel. Joseph knew his brothers on their arrival, but did not discover himself. He questioned them roughly as to who they were, and on being told they were twelve brethren, one man's sons, of whom the youngest was at home, "and one is not," he insisted on their producing their younger brother, and kept Simeon as a hostage for his forthcoming. He then filled their sacks, putting into each sack the money that had been paid for it. On their return to their father they related their story, but Jacob would not part with Benjamin, until the famine rendered another supply of food imperative. On their return to Joseph he feasted them in his house, distinguishing Benjamin by the largeness of his mess, and on their proposed return framed a charge of theft against Benjamin, by placing a cup in his sack. Judah proposed to become bondsman in order to release Benjamin, after a touching recital of what would be the grief of their aged parent if his youngest son were detained. On this Joseph discovered himself, and ultimately sent for his father. Jacob was almost overcome with the intelligence. He said, "It is enough; Joseph my son is yet alive: I will go and see him before I die." He took his departure with all his family and possessions, and they were settled in the land of Goshen. Here after residing seventeen years, Jacob died, B.C. 1846, aged 147, and was buried by Joseph in the burial-place of the family at Machpelah in Canaan. Joseph returned to Egypt, and survived his father fifty-four years, dying at the age of 110, and "was put in a coffin in Egypt," having exacted an oath that the children of Israel "shall carry up my bones from hence," which was accordingly done when Moses conducted the nation into the wilderness on their way to the Promised Land.

JACOBI, FREDERICK HENRY, a philosophical writer of Germany, was born at Disseldorf, in 1743. He was distinguished, not so much as the author of a peculiar system of philosophy, as for the critical acumen and forcible eloquence with which he detected and exposed the incoherences and defects of the prevailing systems, of which he traced the inevitable consequences with great rigour and sagacity. Originally educated for a mercantile profession, Jacobi united the pursuits of literature to those of commerce until his appointment as councillor in the Hofkammer of his native city, which he obtained by the good offices of the Count von Golstein, enabled him to indulge his natural tastes and inclination by devoting his whole time and attention to literature. In this new career he sought to combine poetry with philosophy, and his earliest publication was a philosophical poem, entitled 'Friendship and Love,' which first appeared in 1777, but was republished two years afterwards under the simpler title of 'Woldemar.' In this year Jacobi was invited to Munich, and appointed geheimrath, in which situation he evinced the honesty and independence of his character by exposing publicly the injurious tendency and imprudence of the Bavarian system of finances. In 1781 he commenced an able controversy with Mendelssohn, by his work 'On the Doctrine of Spinoza,' which he further prosecuted in his 'Observations on Mendelssohn's Apology for the Doctrine of Spinoza.' By the essay, entitled 'David Hume, or Idealism and Realism,' he provoked the hostility of the followers of Kant, and that of the admirers of Fichte by his 'Sendeschreiben an Fichte,' whose respect however, as well as that of most of his controversial opponents, he secured by the known sincerity of his character and opinions. When the troubles arising out of the French revolution extended to Germany, Jacobi retired to Holstein, whence he removed successively to Wandbeck and Hamburg; from the latter he was called, in 1804, to Munich, to assist in the formation of the new Academy of Sciences, of which he was appointed president, in 1807. This dignity Jacobi resigned upon attaining his seventieth year, but was allowed to retain the salary and

emoluments. Shortly previously his work 'On Divine Things and on Revelation' (Leips. 1811) had involved him in a bitter controversy with Schelling, who, in his answer, which bore the title 'Memorial to the Work on Divine Things,' professed to give the real position of Jacobi with respect to science and theism, or, in other words, to philosophy and religion, and generally to literature. Notwithstanding the unfavourable estimate which this great philosopher drew therein of the literary and philosophical merits of Jacobi, he still maintains a high rank among sincere and honest inquirers after truth; and even if, exclusively occupied with detached speculations, he rather prepared than established a system of philosophy, the profoundness and originality of his views have furnished materials of which more systematic minds have not scrupled to avail themselves for the construction of their own theories.

As a poet, in which capacity he was greatly inferior to his brother (John George), Jacobi was a reflective rather than an imaginative thinker. His poetical merits are chiefly confined to vividness of description and to boldness of style. His philosophical writings, notwithstanding the want of all scientific method, are remarkable for the beauty of the exposition, which is conveyed in a form at once vigorous and harmonious. His views of philosophy, as far as they can be gathered from his scattered and occasional compositions on the subject, were rather of a sceptical than of a dogmatical character, and he denied the possibility of certainty in human knowledge. He maintained that all demonstrative systems must necessarily lead to fatalism, which however is irreconcilable with man's consciousness of the freedom of his rational nature. The general system of nature indeed, and man himself, so far as he is a part of that system, is pure mechanism; but in man there is unquestionably an energy which transcends and is superior to sense, or that faculty which is bound up with and regulated by the laws of nature. This higher energy is liberty, or reason, and consequently sense and reason distinguish to man two distinct spheres of his activity—the sensible or visible world, and the invisible or intelligible. The existence of these worlds no more admits of demonstrative proof than that of sense and reason themselves. Now sense and reason are the supreme and ultimate principles of all intellectual operations, and as such legitimate them, while they themselves do not receive their legitimization from aught else; and the existence of sense and reason necessarily implies the existence of sensible and intelligible objects about which they are conversant. But this existing system of things cannot have originally proceeded either from nature or from man's intellect or reason, for both nature and the human mind are finite and conditionate, and there must be something infinite and unconditional, superior to and independent both of nature and man, to be the source and principle of all things. This being is God. Now as man's liberty consists in his personality or absolute individuality, for this constitutes his proper essence, while the mechanism of nature is hereby distinguished from man, that none of its members are individual of character, therefore that which is superior both to nature and to man must be perfectly and supremely individual; God consequently is one only, and strictly personal. Moreover, as the ground of all subsistence, he cannot be without subsistence; and as the principle of reason, he cannot be irrational. Of the existence of this divine intelligence however all direct proof is as impossible as a demonstration of existence simply. Generally indeed nothing can be known except upon testimony, and whatever rests on testimony is not certainty but *faith*, and such a faith or belief, when its object is the existence of a good and supreme being, is religion.

Jacobi died at Munich on the 10th of March 1819. His complete works have been published in 6 vols. Leipzig, 1819-20.

JACQUARD, JOSEPH-MARIE, was born at Lyon, on the 7th of July 1762, of humble parents, both of whom were employed in operations connected with weaving. He is said to have been left to teach himself even to read and write; but at a very early age he displayed a taste for mechanics, by constructing neat models of buildings, furniture, &c., for amusement. At the age of twelve his father placed him with a bookbinder for a time, and he was subsequently engaged in type-founding and the manufacture of cutlery, in both of which occupations he gave evidence of talent. Owing to the death of his mother, young Jacquard returned to the house and occupation of his father, who died some years after, leaving him a small property, which he employed in the attempt to establish a business in the weaving of figured fabrics. The undertaking failed, and he was compelled to sell his looms in order to pay his debts. He subsequently married, and hoped to receive a portion with his wife which might assist him out of his pecuniary difficulties; but this expectation proved delusive, and he was compelled to sell his paternal residence. His wife, to whom he is said to have been tenderly attached, is described as a model of patience, kindness, and activity; while he appears, without fortune or foresight, to have occupied himself with ingenious schemes for improvements in weaving, cutlery, and type-founding, which produced nothing for the support of his family. Necessity at length compelled him to enter the service of a line-maker in Bresse, while his wife remained at Lyon to attend to a small straw-hat business. In 1793 he ardently embraced the revolutionary cause, and in the following year he returned to Lyon, and assisted in the memorable defence of that place against the army of the Convention. His only son, then a youth of fifteen, fought by his side. Being denounced

after the reduction of Lyon, they were both compelled to fly, and they then joined the army of the Rhine. His son was killed in battle, and upon this Jacquard returned to Lyon, where he found his wife, whom he had been unable to inform of his flight, earning her bread by plaiting straw, in which humble occupation he was compelled by poverty to assist. Lyon at length began to rise from its ruins, and its artisans returned from Switzerland, Germany, and England, where they had taken refuge. Under these circumstances, Jacquard applied himself with renewed energy to the perfection of the beautiful apparatus for figured weaving which bears his name. He had conceived the idea of such an apparatus as early as 1790, and he now succeeded, though but imperfectly, in accomplishing his end. His machine was presented, in September 1801, to the national exposition of the products of industry, the jury of which awarded him a bronze medal for its invention. In the same year he obtained a patent, or 'brevet d'invention,' for a term of ten years. He set up a loom on his new principle at Lyon, which was visited by Carnot and several other of the statesmen who were assembled at that city in 1802 to arrange the affairs of the Cisalpine republic.

About this time the attention of Jacquard appears to have been directed, by the accidental perusal of a paragraph from an English newspaper, stating that a reward was offered by a society in this country for the invention of such an apparatus, to the construction of a machine for weaving nets for fishing and maritime purposes. From the account given by Dr. Bowring, who had conversed on the subject with Jacquard himself, before a select committee of the House of Commons on the silk trade in 1832, this would appear to have been Jacquard's first mechanical invention; but the more circumstantial account in the 'Supplément' to the 'Biographie Universelle,' to which we are chiefly indebted for the materials of this article, shows that such was not the case. He accomplished the desired object; but, having amused himself and his friends with his contrivance, he threw it aside. His machine-made net however fell into the hands of the *préfet* at Lyon, and the result was that, according to the arbitrary fashion of the time, he and his machine were placed under arrest and conveyed to Paris, where the invention was submitted to inspectors, upon whose report a gold medal was awarded to him in February 1804. On occasion of this forced visit to Paris, Jacquard was introduced to Napoleon I. and Carnot, when the latter, not understanding his mechanism, roughly asked him if he were the man who pretended to do that impossibility—to tie a knot in a stretched string. Jacquard, not disconcerted at such a reception, explained the action of his machinery with simplicity, and convinced the incredulous minister that the supposed impossibility was accomplished by it. He was then employed for a time in repairing and putting in order the models and machines in the Conservatoire des Arts et Métiers, and while there he produced some ingenious improvements in weaving-machinery, one of which was for producing ribbons with a velvet face on each side. He also contrived some improvements upon a loom invented by Vaucanson, which improvements have been stated to be the origin of the Jacquard machine. According to the French authority above referred to, however, this improvement upon Vaucanson's loom was not connected with his great invention; and, as its mechanism is very complex, its application limited to very small patterns, its action slow, and its cost very great, it is considered to belong rather to the class of curious than of useful machines.

In 1804 Jacquard returned to Lyon, where he was long engaged in superintending the introduction of his inventions for figured weaving and for making nets, in which he was powerfully aided by Camille Pernos, a rich manufacturer. Through his assistance, a commission of manufacturers was appointed to report upon the first-named invention, and eventually an imperial decree, dated Berlin, October 27, 1806, was issued to authorise the municipal administration of Lyon to purchase his invention for the use of the public. In the same year the Academy of Sciences and Arts at that city presented him with the prize medal founded by the *consul* Lebrun. For some years Jacquard had to struggle against much opposition and prejudices on the part of the Lyonese weavers, who conspired to discourage the use of his machinery, wilfully spoiled their work to bring it into discredit, and, through the *Conseil des Prud'hommes*, who were appointed to watch over the commercial interests of the city, had it publicly broken up and sold as old materials. Even his personal safety was at times endangered. At length however, under the effect of foreign competition, the value of the invention was acknowledged, and it was brought very extensively into use, not only in France, but in Switzerland, Germany, Italy, and America.

Jacquard was solicited by the manufacturers of Rouen and St. Quentin to organise their factories of cotton and batiste, and he received a tempting offer of a similar nature from England; but he preferred remaining at Lyon, where he continued to exert himself in promoting the use of his great invention until, having lost his wife, he retired to Oullins, a village near Lyon, where he spent his latter years in retirement, and died on the 7th of August 1834, at the age of eighty-two. During his life he received the cross of the Legion of Honour, and in 1840 a public statue was raised to his memory at Lyon. His 'Éloge Historique' has been published by M. de Fortis.

"The name of Jacquard," observe the writers of his memoir in the 'Biographie Universelle,' "has become, so to speak, technical in both

the old and new world." "The happy continuator of the efforts of Vaucanson, who, like him, was engaged at Lyon in the improvement of weaving-machinery, Jacquard has invented a simple and cheap machine, coming within the reach of the humble weaver, the introduction of which forms a memorable epoch—a new era—in the textile art." By its agency the richest and most complex designs are produced with facility at the most moderate price; and it has increased the number of workmen in the manufacture in which it is used nearly twenty-fold.

JAHN, JOHANNES, a distinguished Roman Catholic theologian, was born at Taswitz, in Moravia, in 1750. He devoted himself early to the study of the oriental languages, in which he acquired a great extent of knowledge and a high reputation. He wrote grammars of the Chaldee, Syriac, Arabian, and Hebrew tongues; an 'Introductio in libros sacros veteris Testamenti,' which has gone through several editions; 'Biblische Archäologie,' Vienna, 1797-1800, which has been translated into English; and a 'Commentarius criticus in libros propheticos veteris Testamenti,' Vienna, 1815. For a considerable time he was professor of theology in the University of Vienna, an office which he resigned in 1807. He was then made a canon, and died in 1815.

JAMES I., King of Scotland, was a younger son of King Robert III., who, hearing of the licentious conduct of his other son, David, prince of Scotland, directed Robert duke of Albany, the boy's uncle, to seize him and keep him a prisoner till he promised amendment. This order was readily obeyed by Albany, who wished nothing better than an opportunity to usurp the throne; and in a short time the prince died of dysentery, as it was said, but, as was believed, of hunger in confinement. The king now began to fear Albany, and accordingly had his remaining son James secretly put on board a vessel for France. He did not escape however; for when but a short way on her voyage the vessel was taken by an English ship of war, and the prince carried prisoner to London. His weak old father was so affected by the news that in a few hours after receiving the intelligence he died of a broken heart. The Duke of Albany was thereupon made regent of the kingdom.

James, now in the thirteenth year of his age, was on the 14th of April 1405, conducted to the Tower, where he was detained till the 10th of June 1407, when he was removed to the castle of Nottingham. He was carried back to the Tower again on the 1st of March 1414; but a few months afterwards he was taken to Windsor, where he remained till the summer of 1417, when King Henry V. took him with him on his second expedition to France. The Duke of Albany died in 1419, and from that time measures began seriously to be taken for his release. During all this period James was receiving the best education which could be procured. He became familiar with sights of regal pomp and power, and with the manners and customs of the English court, at a time when there was much to interest and captivate the youthful mind. His habits were active, his conduct prompt and resolute, and at his return to his native kingdom he was in the spring and vigour of his life. He was long afterwards remembered in Italy as the inventor of a plaintive sort of melody, which had been admired and imitated in that country. He was one of the best harpers of his time, and excelled all the Irish and Scotch Highlanders in their use of that instrument; and in the three pieces of his which have come down to our day—"Christ's Kirk on the Green," the 'King's Quhair' (or Book), and 'Peebles at the Play'—we have no mean specimens of intellectual power and literary skill.

At his accession, in 1424, Scotland was in many respects a perfect contrast to England; it was in fact rather an aggregate of rival powers than a settled and united kingdom. There were still two justiciars of co-ordinate authority, one on the north and the other on the south of the Forth; and in the former portion of the realm, which alone was properly denominated Scotland, and where the seat of authority still principally lay, there were numerous and powerful clans. The regencies, in the absence of James, had contributed to the national disorder—the two Albanies sacrificing to their own ambitious projects the just authority of government and the supremacy of the law.

James entered on the administration of his kingdom with a spirit and energy suitable to the high notions of prerogative which he had imbibed. Immediately on his arrival he proceeded against the family and adherents of the late regents, and eventually had several of them condemned and forfeited. All the customs of the realm, great and small, were annexed to the crown, and every valuable mine of gold or silver. A new coinage was struck, of like weight and fineness with the money of England; hospitals were to be visited and reformed; idleness and begging were forbidden; the law records of the kingdom (which seem to have been in a state of neglect) were to be inspected and ascertained; and the statutes of parliament were ordered, for the first time, to be regularly enrolled. This was not all however; for in the spirit of King Henry IV.'s time, which had witnessed some detestable examples of religious persecution, an act was passed 'anent heretics,' that inquisition be taken by every bishop in his diocese, and, "gif it misteris," that secular power be called in support and aid of the Church. In his time the chancellor and clergy first got a footing in the administration of the common law. This was in the year 1425, when the chancellor and certain persons of the three estates chosen by the king were empowered, under the name of the Court of Session,

to hear and finally determine all complaints, causes, and quarrels competent before the king and his council.

We have already alluded to the king's conduct towards the family and friends of the regent Duke of Albany immediately on his accession to the throne. At a later period of his reign we have another signal instance of the king's energy and promptitude of purpose in his conduct towards the Lord of the Isles. About the year 1427 the Lord of Isla was slain by a person of the name of Campbell, who had, it seems, a commission from the king to apprehend Isla; but, it is added, he exceeded his powers in putting that chieftain to death. The circumstance occasioned great disturbance throughout the highlands and isles. Determined to restore order, and to enforce the laws in those wild districts, the king summoned a parliament at Inverness, to which the Lord of the Isles and the other highland chiefs were cited to appear. On their arrival, to the number of about forty, they were seized by a stratagem of the king, and committed to prison in separate apartments. The Lord of the Isles and some others were at length liberated; but, deeply feeling the indignity he had suffered, the Lord of the Isles, immediately on his return home, gathered together his friends and vassals, and at the head of a vast force wasted all the crown lands near Inverness, and made an attempt also to destroy the town. Information of this inroad being communicated to the king, orders were instantly given to repair to the spot; and leading his troops in person, he succeeded by forced marches in coming up with the rebels in Lochaber, at a time when they least expected such a thing. The consequence was that at length the rebels made an unconditional surrender, and the Lord of the Isles was obliged to make his submission on his bended knees at the court of Holyrood House.

The king's vigour and determination were not a little obnoxious to the nobles, who saw in it the speedy ruin of their usurped authority. But it is probable that his devotion to the ecclesiastics wounded them more keenly than all the exercise of his royal power. They felt humbled, not so much before the sovereign as before the clergy. A conspiracy was accordingly formed against him, under the Duke of Athol, the king's uncle, and on the 21st of February 1437, the king was murdered, in the forty-fourth year of his age. A year or two afterwards also his adviser Wardlaw, bishop of St. Andrews, died; and immediately on this event Bishop Cameron, Wardlaw's favourite, was turned out of the chancellorship which he had held from the institution of the Court of the Session, and Sir William Crichton, a layman, and the first who had held the great seal for a long period, was constituted chancellor; the Court of Session expired, and the course of the old common law was re-established.

JAMES II., King of Scotland, only son of James I., succeeded to the crown when but about seven years old. The rivalry which existed between the nobles and ecclesiastics at his father's death continued; and the one party or the other prevailed according as by violence or stratagem they obtained possession of the king's person. Disorder naturally spread throughout the kingdom, and the power of individuals grew most insolent from neglect to enforce the laws. The Earl of Douglas in particular erected a sort of independent principality in the country, and forbidding his vassals and dependents to acknowledge any authority save his own, he created knights, appointed a privy-council, named officers, civil and military, and appeared in public with a splendour and magnificence more than royal. To add to the calamities which the nation suffered, the country was visited by a plague, and there was also a great famine. The king was immature in mind as in years, and altogether deficient in the vigour necessary in his circumstances and situation: his partialities were also misplaced. During his whole reign the country was disturbed by intestine broils, and though continual executions and forfeitures took place, yet no regular or effectual measure was adopted to obtain or secure peace. He was also attacked from England, and at the siege of Roxburgh, which was occupied by the English, he was killed by the bursting of a cannon. This was in the year 1460, and in the twenty-ninth year of the king's age.

JAMES III., King of Scotland, was, like his father James II., about seven years old at his accession to the throne, 3rd of August 1460. He had scarcely begun his reign when Donald, the Lord of the Isles, seeing the weakness of government and the distracted state of the kingdom, assembled a council of his friends and vassals at his castle of Ardtornish, and in the style of an independent prince granted a commission to ambassadors to confer with deputies from Edward IV., king of England, with a view to the settlement of the realm. The commissioners met at Westminster, and after a negotiation, concluded a treaty, dated at London, 13th of February 1462, the object of which was no less than the conquest of Scotland by the vassals of the chieftain and the auxiliaries to be furnished by Edward, with such assistance as could be given by the banished Earl of Douglas. While this rebellion was going on in the north, Robert lord Boyd, one of the lords of the regency, and also lord-justiciar south of the Forth, and lord-chamberlain of the kingdom, was grasping in another part of the country at all the chief honours and places of government, and it would seem that the minor offices of magistrates and common-councilmen in the several burghs were also then objects of tumultuous contest: for it was at this time the Act 1460, c. 29, was passed, by which the entire system of burgh election was changed, on the

pretence of such confusion. This act was the foundation of the 'close system,' which was only remedied by the Burgh Reform Act for Scotland. The same year the Act 1469, c. 30, was passed, subjecting all notaries to the examination and authority of the Ordinary. This act was passed to please the clergy, who had the ear of the king. The latter indeed appears to have been the known slave of his ecclesiastics, and Sir James Balfour ('Annals of Scotland,' an. 1481) records a trick played off upon him by King Edward IV. of England, who trimmed up a person in the habit of a papal legate, and sent him to James with injunctions and excommunications in the name of his Holiness. The imposition succeeded completely. The king took up also with low favourites, and on their account involved himself in a quarrel with his nobles, which ended in the encounter at Bannockburn. The king fled in fright from the field, and falling from his horse was 'harled' into a miller's cottage, where, on being discovered, he was secretly killed and carried off, nobody knew where (Pitcottie, 220). The king's death took place in June 1483, in the thirty-fifth year of his age.

JAMES IV., King of Scotland, son of James III., was about fifteen years old at his accession to the throne, which took place on the 11th of June 1488. He was of an active disposition, full of life and vigour; and in his time the commerce and literature of the country flourished under his encouragement. But though he possessed not a few of the elements of a great mind, he unfortunately became the slave of superstition, and thence in his public conduct a mere tool in the hands of his clergy.

In 1494, having fallen into a state of melancholy on the reflection that he had countenanced the rebellion in which his father perished, he received a legate from the pope, and, in obedience to him, bound about his waist an *iron belt*, to be worn in penance, day and night, for the remainder of his life. Some time after this his queen fell sick, and immediately thereupon he made a pilgrimage to St. Ninian's in Galloway, on foot, for her recovery, and she having afterwards recovered, they both went thither in pilgrimage the same year. That year also he went to St. Duthin's in Ross—which was to the extreme north of the kingdom, as the other shrine was at the extreme south; and it appears most probable that it was at the desire of the ecclesiastics he made those repeated progresses to the highlands and isles in which we find him engaged, with the ostensible purpose of quieting that part of the realm, but in fact to remove him from the seat of authority and government. In the meantime the clergy were not idle. In the above year, 1494, the University of Aberdeen (the third of the Scottish universities) was founded; and in the same year an act was passed in parliament, enjoining all barons and freeholders of substance to put their eldest sons to grammar learning, and thereafter for three years to the universities to study the canon and civil laws. In 1503, while the archbishop of St. Andrews was lord chancellor, the court of 'Daily Council' was instituted—a court of the same nature and extensive jurisdiction as the previous Court of the Session, composed of the chancellor and others appointed by the crown; and the same year an act was passed subjecting all notaries to the examination of the Ordinary. In 1512 a great council of the clergy was held at Edinburgh, where the famous *Valor beneficiorum*, called 'Bagimont's Roll,' was made up. The following year the king, taking up the French cause, entered, with the flower of the kingdom, on the fatal field of Flodden, where he perished. [HENRY VIII. of England.]

JAMES V., King of Scotland, son of James IV., was little more than a year old when the crown devolved upon him; but so equally poised was the balance of power in Europe at this time that, as the favour of Henry VIII. of England was anxiously sought by the rival monarchs of Germany and France, so all three courted the favour of James's government. The state of the papal see was also peculiar at this time; for besides the risks which it ran from the collision of temporal interests, it was now raising up for itself determined enemies within its own dominions. The reforming spirit of Martin Luther and his followers spread into Scotland, and introduced new elements of discord into a country then in a singularly distracted state. The regency of the young king was long an object of ambition, and in the struggle everything was forgotten by the contending parties but success. The king was besieged, captured, and retaken; and personal rencoures between nobles and their vassals in the streets of the metropolis were of frequent occurrences. The loss of laymen however at Flodden had given a decided advantage to the clergy, and the ecclesiastical interest at last bore undisputed sway. Gavin Dunbar, who had been the king's preceptor, was made Archbishop of Glasgow in 1524; in 1528 he was appointed lord chancellor; and in four years afterwards the Court of Session was erected—a court of general and supreme jurisdiction under the chancellor. The latter was now at the head both of the church and common law, and when Cardinal Beaton became chancellor his vast powers were exercised with such force and rapidity as threatened, and well nigh accomplished, the extermination of every power in the kingdom but his own and the papal. It was a matter of course that all attempts at an alliance with the king by King Henry VIII., who had become embroiled with the papacy, should be rejected. A war was thus provoked, and James was obliged to court those nobles whom it had been the policy of his court to humble. They joined him, but in a spirit of determined revenge. In an attack on the Scottish border the English were repelled, and an

opportunity offered to the Scots of cutting off their retreat. The king accordingly gave orders to that end, but his barons refused to advance; and in a subsequent engagement 10,000 of the Scots deliberately surrendered themselves prisoners to the enemy. The spirit of James sunk under his contending passions, and he died of a broken heart in the thirty-third year of his age.

JAMES I. of England and VI. of Scotland, was the only offspring of Mary, queen of Scots, by her second husband, Henry Stuart, lord Darnley, who, through his father, Matthew Stuart, earl of Lennox, being descended from a daughter of James II., had some pretensions to the succession of the Scottish throne in case of Mary dying without issue, and who was the grandson, as Mary was the granddaughter, of Margaret Tudor, through whom the Scottish line claimed and eventually obtained the inheritance of the crown of England after the failure of the descendants of Henry VIII. The son of Mary and Darnley (or King Henry, as he was called after his marriage) was born in the castle of Edinburgh on the 19th of June 1566, and was baptised according to the Roman Catholic ritual in Stirling Castle, on the 17th of December following, by the names of Charles James. The murder of Darnley took place on the 18th of February 1567, and was followed by Mary's marriage with Bothwell on the 15th of May of the same year; her capture by the insurgent nobles, or lords of the congregation as they called themselves, at Carberry, on the 14th of June; her consignment as a prisoner to the castle of Lochleven, on the 17th; and her forced resignation of the crown, on the 24th of July, in favour of her son, who was crowned at Stirling on the 29th as James VI., being then an infant of little more than a year old.

The circumstances of the time, which was that of the final struggle in Scotland between the two great interests of the old and the new religion, which besides their intrinsic importance were respectively identified with the French and the English alliance, and also with the old and the new distribution of the property of the kingdom, made the minority of James stormy beyond even the ordinary use and wont of Scottish minorities. Before his mother's marriage with Bothwell he had been committed by her to the care of the Earl of Mar, a nobleman of the most estimable character, who had retired with his charge to Stirling Castle, and there resolutely withstood all Bothwell's attempts to obtain possession of the infant prince. There he continued to reside during the regencies of the Earl of Murray (22nd of August 1567 to the 23rd of January 1570), of the Earl of Lennox (27th of January 1570 to the 4th of September 1570), of the Earl of Mar (6th of September 1570 to the 29th of October 1572), and of the Earl of Morton (24th of November 1572 to the 10th of March 1578), his education being placed under the general direction of Mar's brother, Alexander Erskine, under whom were employed George Buchanan and three others of the most distinguished among the Scottish scholars. After his brother's death not only the custody of the king's person, but also the command of the castle, were left in the hands of Erskine; and principally by his management, in concert with the earls of Argyll and Athol, a plot was arranged in the beginning of the year 1578, the result of which was that at a council composed of nearly all the nobility of the kingdom, which met at Stirling, James, young as he still was, was requested to take the government into his own hands, and Morton was compelled to resign the regency at Edinburgh on the 10th of March, to the great joy of the nation, with whom the severity and rapacity of his administration had made him universally odious. Affairs were now nominally administered by the king, assisted by a council composed of twelve of the nobility. The new government however soon became unpopular, principally from the presumed or notorious inclination of its leading members in favour of popery; and this state of things in a few weeks opened a way for Morton to the resumption of nearly all his former authority. Into the hands of this man, undoubtedly one of the chief actors in the tragedy of his father's murder, the young prince now fell; and Morton succeeded in retaining his prize, notwithstanding all the efforts of the opposite party, till, partly by force, partly by skilful negotiation, he had apparently re-established his power on a foundation of complete security. It was not long however in being undermined, chiefly by the intrigues of two individuals, who seem to have first made their appearance at the Scottish court in the latter part of the year 1579, and immediately became the objects of the unbounded fondness of the young king. One of these earliest of James's succession of favourites was Esmé Stuart, a son of a younger brother of the Earl of Lennox, and therefore a near relation of his own: he was a native of France, and bore in that country the title of Lord D'Aubigny, to which James rapidly added the Scottish honours of Lord Aberbrothock, Earl of Lennox, and then Duke of Lennox, with the appointments of governor of Dumbarton Castle, captain of the royal guard, first lord of the bed-chamber, and lord high chamberlain. The other, a much darker character, was a Captain James Stuart, the second son of Lord Ochiltree. On the 30th of December 1580, the mind of the king having been previously prepared for what was to be done, Captain Stuart entered the council-chamber, and formally accused Morton of having been accessory to the murder of the late King Henry. The earl was immediately committed to prison, and notwithstanding the most strenuous efforts in his behalf by the English queen, he was brought to trial before the court of judicatory, condemned, and executed at Edinburgh, 2nd June 1581. The two favourites, Lennox,

and Stuart, recently created Earl of Arran, were now the rulers of the kingdom, and they exercised their uncontrolled power with unmeasurable insolence. At length a party of the nobles, including the earls of Mar, Glencairn, and Gowrie, lords Lindsay, Boyd, and others, concerted a scheme for seizing the king's person, which they carried into effect on the 12th of August 1582 at Gowrie's Castle of Ruthven in Perthshire, whence the enterprise is known in Scottish history by the name of the Raid of Ruthven. On this revolution Arran was thrown into confinement, Lennox was ordered to leave the kingdom, and soon after died in France, and James himself remained a captive in the hands of the conspirators, whose proceedings immediately received the full approval of a convention of the estates. They had also the active though unavowed support of Queen Elizabeth, who in the overthrow of the government of Morton and the ascendancy of Lennox and Arran had seen her whole policy with regard to the northern kingdom thwarted. On the other hand, Henri III. of France interposed his influence, though unsuccessfully, to rescue the Scottish king from the thraldom in which he was now kept.

James remained in a state of restraint amounting almost to actual imprisonment for about ten months. At last, on the 27th of June 1583, having been permitted to go from Falkland to St. Andrews, he contrived, with the assistance of some friends, with whom he had arranged his plans, to throw himself into the castle there, and to maintain his position till the faction of his enemies, finding themselves outnumbered by those who flocked from all parts to his assistance, threw down their arms and gave up the contest. One of the king's first acts after he recovered his liberty was to release and recal to court the infamous Arran, and again to commit the management of affairs to that wretched minion, whose government speedily became as harsh and arbitrary as ever. James in the first instance had evinced a disposition to follow a moderate and conciliatory course with the faction lately at the head of affairs; he had even visited the Earl of Gowrie at Ruthven Castle and granted him a full pardon; but under the influence of Arran he soon changed his conduct. An act was obtained from the convention of estates declaring all those who had been concerned in the Raid of Ruthven guilty of high treason: most of them made their escape to England; but Gowrie, who relying on his pardon had made his submission, was seized, thrown into prison, tried, condemned, and sent to the block. Seeing the power of that party thus to all appearance broken for ever, Elizabeth now applied herself to form an alliance with Arran, who readily undertook that the government of Scotland should be conducted in conformity with the wishes of the English queen, and by his unbounded influence over his royal master was easily able to perform that engagement. James was induced, among other acts of subserviency, to write to his mother in such undutiful and unfeeling terms as to make Mary, in the bitterness of her resentment, threaten to leave him the load of a parent's curse. Soon after this, July 29th, 1585, a treaty of intimate alliance was concluded between Elizabeth and the Scottish king, and an annual pension of 5000*l.* was settled by Elizabeth upon James. A chief manager in these transactions had been a new court favourite of James, the eldest son of Lord Gray, styled the Master of Gray, an individual well fitted by nature and education for intrigue and treachery. With the view, it is supposed, of removing a formidable rival, Arran had caused Gray to be sent as ambassador to the English court, where the unprincipled politician appears to have been immediately gained over by Elizabeth, and engaged by her to act his part in forwarding her various schemes of policy with regard to Scottish affairs. One of the first uses which Elizabeth made of this new instrument was to effect the overthrow of Arran, on whose unsteadiness and caprice she felt that she could place little reliance. With her connivance, the lords who had been banished on account of the Raid of Ruthven entered Scotland at the head of a force of 10,000 men, in the end of October 1585, and advanced to Stirling, where the king and Arran were, invested the castle, on which Arran took to flight, and the king was compelled to negotiate with them upon their own terms. All their past offences were pardoned; the principal forts of the kingdom were put into their hands; and, a parliament having been called, Arran and his late associates were all dismissed from power, Arran himself being besides stripped of his titles and estates—the latter, chiefly the confiscated property of those whose moment of retaliation was now come. The new settlement of the government was followed by the conclusion, July 8th, 1586, of another treaty with England, by which the two kingdoms bound themselves in a league offensive and defensive against all foreign powers who should invade the territories or attempt to disturb the reformed religious establishment of either.

In October of the same year James's mother, the unfortunate Mary, after her imprisonment of nearly twenty years, was brought to trial, and on the 8th of February following she was put to death. Between her condemnation and her execution James had made considerable exertions to save her; in addition to solicitations and remonstrances, he took steps to obtain the aid of France, Spain, and other foreign courts in support of his demands; but his ambassador to the English court, the Master of Gray, is said to have actually been the most urgent instigator of the execution, often reminding Elizabeth and her ministers that the dead cannot bite, and undertaking that no unpleasant consequences should follow from any momentary resentment which James might show. In point of fact, the Scottish king was very soon

pacified; he blustered at first under the sting of the insult that had been offered him; but reflecting that by any violent course he should put in hazard both his pension and his chance of the English succession, he prudently allowed himself to be soothed by Elizabeth's excuses, and continued on the same terms of friendship with her as before. Gray was however, on the discovery of the part he had acted, disgraced and dismissed from court. The next year James signalled his zeal in the service of his English patroness by firmly rejecting all the overtures of the king of Spain and the other Roman Catholic powers to induce him to join them, and by co-operating zealously with Elizabeth in her preparations for repelling the attack of the Armada.

In 1589, James was married to the princess Anne, the second daughter of Frederick II., king of Denmark. He proceeded in person to Upslo in Norway, to which place his bride, after having put to sea, had been driven back by a storm, and there the marriage was solemnised on the 24th of November. James did not return to Scotland till the 20th of May 1590. The character of Queen Anne, who survived to 1st March 1619, is depicted in the scandalous chronicles of the time in not very creditable colours; she is represented as an eager and restless intriguer, both in politics and in gallantry; on the other hand however Archbishop Abbot, who knew her well, and who was not likely to regard with indulgence some of the faults she is charged with, speaks of her memory with great respect. She seems to have been a person of greater energy and decision than her husband, over whom she exerted considerable influence, notwithstanding his constant doting fondness for one male favourite after another. The first memorable event that occurred in Scotland after the king's return was a daring attempt made by his relation, Francis Stuart, lately created Earl of Bothwell, a grandson of James V. by his son John, prior of Coldingham. He had been committed to prison on the absurd charge, made by some unhappy persons apprehended and tortured as witches, that he had employed their art to raise the storms by which the life of the queen had been endangered on her first attempted voyage to Scotland, and the king had afterwards been so long detained in Denmark. Upon effecting his enlargement, he collected a force of his retainers, and on the night of the 27th of December 1591, entered the palace of Holyrood-House, with the design, as he pretended, of expelling the chancellor Maitland from the king's council, but apparently with still more daring intentions. The alarm was given after he had set fire to several of the apartments and had nearly made his way to where the king was; he succeeded however in making his escape, and fled to the north. The Earl of Huntly having been sent in pursuit of him, took that opportunity of falling upon his private enemy the young Earl of Murray (son-in-law and heir of the late regent), and slaying him, after burning his house to the ground; an atrocity which excited the deepest popular indignation at the time, and is celebrated in Scottish song. Bothwell and all his adherents were soon after attainted in parliament; but this did not put an end either to his audacious proceedings or to the treasonable attempts of other parties. In the beginning of 1593 a new conspiracy of Huntly and the other heads of the popish faction was detected for bringing a Spanish force into the kingdom, with the object of re-establishing Roman Catholicism and invading England; and a few months later, Bothwell, after having failed in another attempt to seize the royal person at Falkland, having associated himself with the remaining adherents or connections of the late favourites Lennox and Arran, suddenly returned from England, where he had been protected by Elizabeth, and on the 24th of July 1593, entered the palace with a band of armed followers, and made the king his prisoner. James was obliged both to grant a full pardon to the traitor and to dismiss the chancellor Maitland and his other chief ministers; and he remained in durance till a convention of the nobles having assembled at Stirling in the beginning of September, his keepers found it necessary to release him. Disturbances however were again and again excited in the course of this and the two following years by the attempts both of Bothwell and the Roman Catholic peers; and at length these two factions, which had hitherto professed the most opposite principles, joining their forces, under the conduct of the Earls of Huntly and Errol, encountered the royal army commanded by the young Earl of Argyle, at Glenlivet in Aberdeenshire, October 3rd, 1594, and, notwithstanding their inferiority in numbers, put it completely to the rout. This disaster however was immediately repaired by the results of an expedition conducted into the northern districts by James in person, who forced the Roman Catholic lords first to retreat to the mountains, and eventually to make their submission, when they were allowed to retire beyond seas on giving security that they would engage in no further intrigues against the Protestant religion or the peace of the kingdom. Bothwell fled to France, and afterwards withdrew to Spain and Italy, where he professed himself a convert to the Romish faith, and spent the rest of his days in obscurity and indigence.

These commotions had scarcely been quieted when James became involved in new troubles in consequence of a contest into which he was brought with the clergy of the Presbyterian Church, which had been legally established as the national form of religion by an act of the Scottish parliament in 1592. Although James had been induced by considerations of policy to give his assent at the moment to this popular act, he was himself an avowed admirer of episcopacy, and was even very generally suspected of a strong inclination towards popery;

so that the alliance of Church and State in this case was one of a very frangible nature. To make matters worse, both parties cherished the loftiest notions of their powers and rights. In December 1596, in a tumult of the people of Edinburgh, excited as was said by the clergy, the life of the king was placed in great danger, and the decided measures that followed on both sides made the contest assume the appearance of the commencement of a civil war. Nearly all the aristocracy and the upper classes however were with the king; and by an unusual exertion of vigour and firmness James was enabled not only completely to crush the insurrection, but to turn the occasion to account in bringing the Church into full subjection to the civil authority. In the course of the following year, 1598, the substance of episcopacy, in a political sense, was restored by seats in parliament being given to about fifty ecclesiastics on the royal nomination. Even the General Assembly was gained over to acquiesce in this great constitutional change.

The most memorable event in the remainder of James's Scottish reign was the mysterious affair known in history by the name of the Gowrie conspiracy. On the 5th of August 1600, James, being then at Falkland, was induced by Alexander Ruthven, a younger son of the Earl of Gowrie who was executed in 1584, to accompany him with a few attendants to the house of his brother the Earl of Gowrie at Perth. Some time after his arrival he was led by Ruthven into a retired apartment of the house; there a struggle took place between the two, in the presence only of the earl's steward, who was in full armour, but either did not interfere at all, or, according to his own account, only for the king's protection. Meanwhile, what was going on was perceived from the street, on which the people assembled, and the king's attendants rushed to the room: in the end the king remained unhurt, but both Alexander Ruthven and his brother the earl were killed. These are nearly all the known facts of this strange transaction: they seem to establish a design on the part of the Ruthvens to obtain possession of the king's person, but there appears little ground for supposing as has been frequently asserted that they were prompted by the English government. That they intended to take his life, as James endeavoured to make it appear, the whole circumstances of the case will scarcely allow us to suppose. The passage however is one of the least understood in history, and after the expenditure of much ingenuity in the attempt to clear it up, it may be pronounced that no explanation of it which is satisfactory at all points has yet been given. Whatever was the nature of the affair, it stands isolated from all the other events of the time, and had as little effect upon anything that came after it as it is known to have had of connection with anything that went before.

In the last years of his residence in Scotland James was much occupied in taking measures for securing his succession to the English throne, an object which, from the capricious temper of Elizabeth, and other circumstances of the case, remained of doubtful attainment up to the very moment of its accomplishment. Although no party to the rash attempt which cost the Earl of Essex his life in 1601, he had been previously in correspondence with that nobleman, who seems to have led the Scottish king to believe that zeal for his cause was the motive of his conduct: and after receiving the news of the ill success of his friend, James appears to have been prepared to go all lengths to save him from the block, having even, as is affirmed, so far overcome his habitual timidity as to order the ambassadors, whom he despatched immediately to the English court, to follow up their entreaties and remonstrances, if necessary, with an open declaration of war. The head of Essex however had fallen before the Scottish ambassadors reached London. Eventually Sir Robert Cecil himself became James's chief confidant; but it is a characteristic trait that even after he had thus secured the important services of the English prime minister, James continued to hold a clandestine correspondence on the same great subject of the succession with other parties, of whose participation in the business Cecil apparently was kept in entire ignorance. (See Lord Hailes's 'Remarks on the History of Scotland,' ch. xiv.) Many of Cecil's letters have been preserved, and were published at Edinburgh by Lord Hailes (Sir David Dalrymple) in 1766, under the title of 'The Secret Correspondence of Sir Robert Cecil with James VI., King of Scotland,' 12mo.

James at length became king of England by the death of Elizabeth, 24th of March 1603, when his accession took place without a murmur of opposition from any quarter. Having set out from Edinburgh on the 5th of April, he entered London on the 7th of May, after a journey which in both countries resembled a triumphal progress. Many of his Scottish courtiers accompanied their sovereign, and the prodigality with which he distributed the wealth and honours of the kingdom among these hungry northern adventurers was one of the first things in his conduct that disgusted his new subjects. In his foreign policy James began by continuing in the same course that had been pursued by Elizabeth, entering into a close alliance with Henri IV. of France for the support of the Dutch and resistance to the aggressions of Spain. The conspiracy of Sir Walter Raleigh, Lord Cobham and others, to place on the throne the Lady Arabella Stuart, James's cousin, was the first domestic affair of interest. [RALEIGH, WALTER.] The next business that engaged James's attention was the settlement of the disputes between the Church and the Puritans, for which purpose a conference was held at Hampton Court,

in January 1604, and the points of difference discussed in the king's presence, he himself taking a conspicuous and most undignified part in the debate. James's first parliament met on the 19th of March, and was opened by a speech which, as Hume remarks, "proves him to have possessed more knowledge and greater parts than prudence or any just sense of decorum and propriety." Among other things he zealously urged the union of England and Scotland into one kingdom; but nothing came of this proposal for the present. James however, of his own authority, now assumed on his coins and in his proclamations the title of King of Great Britain.

Peace with Spain was concluded, much to the gratification of the king's wishes, on the 18th of August this year. The great event of the year 1605 was the Gunpowder Plot, of which a sufficient account will be found under FAWKES, GUY, and GARNET, HENRY. For some years after this the history of the reign is marked by no memorable events either foreign or domestic; but although James still continued to govern by parliaments, various causes were contributing gradually to alienate the House of Commons from the crown, and to prepare the elements of that open contest between the two powers which broke out in the next reign. In 1612, the death of James's eldest son, Henry prince of Wales, in the nineteenth year of his age, spread a general grief through the nation, to which the prince had already endeared himself by the promise of a character which may be most shortly described as being in almost all respects—in its defects as well as in its virtues—the reverse of that of his contemptible father. A rumour arose at the time, and has been preserved by some contemporary writers of a violent party spirit, that the prince had been carried off by poison, and not without the privacy and consent of the king; but this accusation, too monstrous to be admitted without the strongest evidence, rests upon neither proof nor probability of any kind. The death of Prince Henry was followed, 14th of February 1613, by the marriage of James's daughter, the Princess Elizabeth, with Frederick the Elector Palatine, an alliance which was attended with important results both in that age and in the next.

The ruling favourite whom James had brought with him from Scotland was Sir George Hume—whom in 1604 he created Lord Hume in the English peerage, and in 1608 Earl of Dunbar in that of Scotland—a man of integrity, as well as of superior talent. The king's silly and mutable fondness however was in course of time transferred to other objects—to Philip Herbert, the second son of the Earl of Pembroke, whom he made Earl of Montgomery in 1605, and who many years after succeeded his elder brother as Earl of Pembroke; and to another Scotchman, Sir James Hay, made a Scottish peer by the title of Lord Hay of Bewlie in 1609, and who afterwards bore successively in the English peerage the titles of Lord Hay of Sawley (1615), Viscount Doncaster (1617), and Earl of Carlisle (1622), by which last he is best remembered. It is said to have been Hay who, about the beginning of the year 1610, introduced at court a young countryman of his own, Robert Carr, or more properly Ker, of a good family, but chiefly distinguished by his handsome person, an advantage which never failed to attract the effeminate king's attention and regard. Carr was immediately taken into the highest favour, made a knight of the Bath, and the next year a peer by the title of Viscount Rochester. In 1613 the young and beautiful Frances Howard, countess of Essex, having by an infamous process, in urging which the king took a part that alone ought to consign his memory to abhorrence, obtained a divorce from her husband, was married to the favourite, her previous profligate passion for whom is believed to have incited her to the proceedings by which she succeeded in dissolving her first marriage. The king on this occasion raised Rochester to the rank of Earl of Somerset (November 1613). Somerset's fall however was still more rapid than his rise. His chief friend Sir Thomas Overbury, who had strenuously exerted his influence to prevent his marriage with Lady Essex, which he represented as the sure destruction of his fortunes, was first, by the contrivance of the unprincipled woman whom he had thus made his enemy, thrown into the Tower, and soon after taken off by poison administered to him by her means, and with the privy of her husband. The crime, though suspected from the first, was not fully discovered till about two years after its commission; but in 1615 all the parties concerned in it were brought to trial, and their guilt completely established. Four persons who had been accomplices in the murder were left to the executioner; the two principals, the wretched Somerset and his wife, had their better merited punishment commuted into confiscation of their property, and imprisonment, from which they were both after some years released. Their condemnation of course threw down the earl from his place and favour at court, and he was given up with the most easy indifference, not unaccompanied with some touches of gratuitous baseness, by James, whose mind had now been taken possession of by a passion for a new minion, another handsome youth, named George Villiers, who had been recently introduced to his notice. Villiers, who, after having been knighted, was created successively Viscount Villiers (1616), Earl of Buckingham (1617), Marquis of Buckingham (1618), and Duke of Buckingham (1623), continued the first favourite and ruling minister during the remainder of the reign. [BUCKINGHAM.]

In the summer of 1617 James paid a visit to Scotland, and, having summoned a parliament, succeeded, though not without great difficulty,

in obtaining the assent of that body, and also of the General Assembly, to such regulations as, along with other innovations previously made since his accession to the English throne, brought the Scottish Church, in government, in ceremonies, and in its position in relation to the civil power, very nearly to the model of the English. It was now no longer a Presbyterian, but nominally as well as substantially an Episcopal church. But the popular feeling of the country was never for a moment reconciled to these enforced changes.

The year 1618 was disgraced by the execution of Sir Walter Raleigh, on the monstrous pretence of the sentence passed upon him for the conspiracy in which he had been involved in the first year of the king's reign, but in reality as a sacrifice to the court of Spain. [RALEIGH.] But the public indignation at James's subserviency to that power was roused to a still higher pitch by the great foreign events of the two following years, when, Austria assisted by Spain having attacked the Bohemians, who had chosen the elector palatine for their king, James not only refused to take part with his son-in-law and the Protestant interest on the Continent, of which he was thus installed as the champion, but even refused to acknowledge his new regal title. Frederick was soon driven from both his acquired and his hereditary dominions by the arms of the Roman Catholic powers confederated against him, and obliged with his family to take refuge in Holland. Staggered by this sudden catastrophe, and by the vehemence with which the people expressed their rage and grief, James now hastened to take some steps to repair the disasters which his pusillanimity and inaction had mainly occasioned. After endeavouring to raise money in the way of a benevolence, he found himself obliged to call together a parliament, the first that had been allowed to meet for six years. In this parliament, memorable among other things for the impeachment of Bacon [BAOON, FRANCE], the first decided stand was taken by the Commons in their contest with the crown by their famous protest, passed on the 19th of December 1621, in reply to the king's assertion that their privileges were derived from the grace and concession of his ancestors and himself: "That the liberties, franchises, and jurisdiction of parliament are the ancient and undoubted birthright and inheritance of the subjects of England." This resolution, which the king tore from the Journals with his own hand, was followed by the immediate prorogation and soon after by the dissolution of the parliament; several of the leading members of the House of Commons being at the same time sent to the Tower or to other prisons.

James had for some time before this set his heart upon the marriage of his son Prince Charles with a Spanish princess: the project of that match had principally influenced him to the course he had taken in the affair of Bohemia, and he now hoped by the same arrangement to be able, without having recourse to arms, to recover the palatinate for his son-in-law. But in both these expectations he was disappointed. For some time the negotiations seemed to proceed favourably; but they were in 1623 brought to an abrupt termination, apparently by the rash interference of Buckingham, who, after having persuaded Prince Charles to proceed along with him to Spain for the purpose of expediting the matter, disgusted and quarrelled with the leading personages of the Spanish court, and then successfully exerted his influence with James to prevent the match. As the public clamour for the recovery of the palatinate still continued, another parliament was assembled in February 1624, which eagerly granted supplies for the attainment of that object by force of arms. War was in consequence declared against Spain, and an army under Count Mansfeldt was sent into Germany in the latter part of the year. But this expedition turned out an utter failure: the force, reduced to half its numbers by a pestilential disorder before it had crossed the sea, never even entered the Palatinate; and that principality remained in the hands of the Duke of Bavaria, to whom it had been assigned, along with the electoral dignity, by the imperial diet.

James's reign, of nearly fifty-eight years in Scotland and rather more than twenty-two in England, was terminated by his death on the 27th of March 1625, when he was within three months of completing the fifty-ninth year of his age. As happened in the case of the death of almost every person of eminence in that and the preceding age, a rumour sprung up that he had been carried off by poison; and when Buckingham was impeached by the Commons in the beginning of the next reign, one of the charges brought against him was that the late king owed his death to some plasters and drinks which he had administered to him without the knowledge of the physicians. In fact something of this kind does appear to have taken place, although Buckingham's intentions in what he did may possibly have been innocent enough. It was even said, in the violence of party hate, that Charles himself was implicated in the poisoning of his father; and this grossly improbable imputation received the sanction of Milton. The statements upon the subject are collected in Harris's 'Life of James I.,' pp. 281-288; and 'Life of Charles I.,' pp. 21-25 (edit. of 1814).

James's children by his queen, Anne of Denmark, born on the 12th of December 1574, married on the 24th of November 1589, died on the 2nd of March 1619, were—1, Henry Frederick, born at Stirling Castle on the 19th of February 1594, died on the 8th of November 1612; 2, Robert, died in infancy in Scotland; 3, Charles, who succeeded his father as king; 4, Elizabeth, born on the 19th of August

1596, married to Frederick V. Elector Palatine on the 14th of February 1613, died on the 8th of February 1662; 5, Margaret, born on the 24th of December 1598, died in infancy; 6, Mary, born in 1605, died on the 16th of December 1607; 7, Sophia, born on the 21st of June 1606, died two days after. The Electress Sophia, the mother of George I., was the youngest of the thirteen children of the Princess Elizabeth and her husband the Elector Palatine. [GEORGE I.]

Besides the well-authenticated public acts of James I., many materials may be found for the illustration of his character in the works of various writers who were his contemporaries—especially Sir Anthony Weldon's 'Court and Character of King James,' 12mo, 1651; Arthur Wilson's 'Life and Reign of King James the First, King of Great Britain,' fol., 1653, or as reprinted in the second volume of Bishop Kennet's 'Complete History;' Sir Edward Peyton's 'Divine Catastrophe of the Kingly Family of the House of Stuarts,' 8vo, 1731; 'The Non-such Charles, his Character,' 12mo, 1651 (supposed by some to be written by Peyton); Sir Ralph Winwood's 'Memorials of Affairs of State in the Reigns of Queen Elizabeth and King James I.,' fol., 1725; Francis Osborne's 'Traditional Memoirs on the Reign of King James,' in Works, 8vo, 1873, &c.; and Roger Coke's 'Detection of the Court and State of England,' 2 vols. 8vo, 1697. See also Dr. James Welwood's 'Memoirs of the most material Transactions in England for the last Hundred Years preceding the Revolution,' 8vo, Lond., 1700. Although some of the above-named writers are avowedly very unfavourably disposed to the memory of this king, and relate scarcely anything of him that is not to his discredit, there is too much ground for believing that the most severe of them have scarcely exaggerated the more despicable features of his character. Even his better qualities leaned to the side of vice or weakness; his easiness of temper was but an indolent sensuality, and his pacific disposition and aversion to war mere pusillanimity and cowardice. Of dignity or elevation of mind he had no conception; his tastes, opinions, passions, and habits were all alike low and vulgar, if indeed for some of them these be not far too gentle epithets. With such a moral nature, it was impossible that his intellect could be other than a stunted one; yet his education had given him a good deal of learning, at least for a king, and although he was far from being either the profound scholar, philosopher, or divine that he supposed himself, and that he was flattered by his contemporaries, who called him Solomon the Second, he was certainly not destitute of some literary talent, however dashed most of the exhibitions of it were with grotesqueness and absurdity.

James was a voluminous author, and any account of him would be very incomplete which did not notice his various printed works in prose and verse. They have been partially enumerated by Harris, in his 'Historical and Critical Life,' and by Horace Walpole, in his 'Royal and Noble Authors;' but the fullest account that we have met with is that given by Dr. David Irving, in his 'Lives of the Scottish Poets,' 2nd edition, 2 vols. Edinb., 1810, vol. ii. pp. 207-91. His first publication, a collection of poems, under the title of 'The Essays of a Prentice in the Divine Art of Poesy,' 4to, appeared so early as 1584. About the same time also he appears to have composed his 'Fruitful Meditation,' upon part of the Revelation of St. John, which however was not printed till 1588. Of his subsequent works the following are the chief:—'His Majesty's Poetical Exercises at Vacant Hours,' 1591; his 'Dæmonologie' (a dialogue, in three books, in defence of the belief in witches), 4to, 1597; 'The True Law of Free Monarchies, or the Reciprocity and Mutual Duty betwixt a free king and his Natural Subjects' (Anonymous), 1598; 'Βασίλειον Δέρον, or his Majesty's Instructions to his dearest Son Henry the Prince,' 1599 (a treatise which, on account of the doctrines it contained on church government, was censured as libellous by the synod of St. Andrews); 'A Discourse of the Unnatural and Vile (Gowrie) Conspiracy against his Majesty's Person,' 1600; 'Triplici Nodo Triplex Cuneus, or an Apology for the Oath of Allegiance,' 1605 (which was answered by Cardinal Bellarmin, and produced a long controversy, and many other publications on both sides, for an account of which see a note by Dr. Birch in the Appendix to Harris's Life); 'A Premonition to all Most Mighty Monarchies, &c.' 1608 (on the same subject); 'A Declaration (in French) concerning the Proceedings with the States-General of the United Provinces of the Low Countries, in the cause of D. Conradus Vorstius' (appointed Professor of Divinity at Leyden), 1612; and 'A Remonstrance for the Right of Kings (in French), in answer to Cardinal Perron,' 1615. A collected edition of all the preceding prose works, except the Discourse on the Gowrie Conspiracy, was published in folio, in 1616, under the title of 'The Works of the Most High and Mighty Prince James, &c., by James (Mountague), Bishop of Winton.' The volume also contained some treatises that had not before appeared, particularly 'A Counterblast to Tobacco' (this however, according to Harris, was first printed in quarto, without name or date), and 'A Discourse of the Manner of the Discovery of the Powder Treason.' A Latin translation of this collection was published under the care of Bishop Mountague, in 1619. To the works already enumerated are to be added a number of speeches to parliament, some of which are not the least curious or characteristic of the royal author's compositions; various sonnets and other short pieces of verse, in English and Latin, scattered in different collections, printed and manuscript; and a metrical version of the Psalms, pub-

lished at Oxford, 12mo, 1691, in which however, according to his funeral sermon, preached by Bishop Williams, he had only proceeded as far as the thirty-first Psalm at his death. It ought also not to be forgotten, that the authorised translation of the Bible was commenced and completed under his auspices.

Of the changes in the law introduced in this reign the most important were effected by certain acts of the parliament which met in February 1623. By one of these (the statute 21 Jac. I., c. 2), entitled 'An Act for the General Quiet of the Subjects against all Pretences of Concealment (of Lands belonging to the Crown) whatever,' it was enacted that no person could in future be sued or impeached by the king for any manors, lands, revenues, &c., unless it might be proved that he or his progenitors had a title to them within sixty years before the meeting of that parliament. This was a very valuable modification of the old law maxim, 'Nullum tempus occurrit regi.' By another of these acts (the statute 21 Jac. I., c. 3), entitled 'An Act concerning Monopolies and Dispensations with Penal Laws,' it was declared that all charters, licences, and letters patent granted to any person by the crown to dispense with any law or statute should be void, and that all licences and privileges for the sole buying, selling, or working of anything should be void, except patents for a term not exceeding fourteen years to the authors of new inventions, and a few other existing patents, which were specially enumerated. This abolition of the dispensing power, and of the power of granting unlimited monopolies, both of which had hitherto been considered to be vested in and had been extensively exercised by the crown, was the extinction of two great practical evils. Blackstone enumerates as the chief improvements made in the administration of private justice in this reign, the abolition of sanctuaries and the extension of the bankrupt laws, the limitation of suits and actions, and the regulating of informations upon penal statutes. To this short list, it has been observed, may be added "the statutes for extending the benefit of clergy to women in certain offences, the restriction upon costs in certain frivolous actions, and the salutary assistance afforded to magistrates in their defence to actions brought against them for things done in the execution of their office."—Note by Mr. Justice Coleridge to Com. IV., 436.

JAMES II. of England and VII. of Scotland, was the second surviving son of Charles I. by his queen, Henrietta Maria of France, and was born at St. James's on the 15th of October 1633. He was immediately declared Duke of York, but not formally created to that dignity till January 27th 1643. After the surrender of Oxford to Fairfax in June 1646, the duke, with his younger brother Henry, afterwards created Duke of Gloucester, and his sister Elizabeth, was committed by the parliament to the care of the Earl of Northumberland, and he continued in the custody of that nobleman till the 21st of April 1648, when he made his escape from St. James's Palace disguised in female attire, and took refuge in Holland with his sister Mary, princess of Orange. Here he immediately joined a part of the English fleet which had revolted from the parliament, and was then lying at Helvoetualys; but although at first received on board as admiral, he soon after resigned that post to his brother, the Prince of Wales, on the arrival of the latter from Paris, and returned to the Hague. When Charles, now styled king by his adherents, arrived at Jersey in September 1649, he was accompanied by the Duke of York, who remained with him during his stay of three or four months. He then returned to the Continent, and resided for some time with his mother at Paris. "Never little family," says Clarendon, who had an interview with him at Breda in 1650, "was torn into so many pieces and factions. The duke was very young, yet loved intrigues so well that he was too much inclined to hearken to any men who had the confidence to make bold propositions to him. The king had appointed him to remain with the queen, and to obey her in all things, religion only excepted. The Lord Byron was his governor, ordained to be so by his father, and very fit for that province, being a very fine gentleman, well bred both in France and Italy, and perfectly versed in both languages, of great courage and fidelity, and in all respects qualified for the trust; but his being absent in the king's service when the duke made his escape out of England, and Sir John Berkley being then put about him, all pains had been taken to lessen his esteem of the Lord Byron; and Sir John Berkley, knowing that he could no longer remain governor when the Lord Byron came thither, and hearing that he was on his journey, infused into the duke's mind that it was a great lessening of his dignity at that age (when he was not above fourteen years of age, and backward enough for that age) to be under a governor; and so, partly by disesteeming the person, and partly by reproaching the office, he grew less inclined to the person of that good lord than he should have been." ('Life,' i. 234, edition of 1827.) Shortly before his meeting with Clarendon it had been reported that Charles, then in Scotland, was dead; upon which the duke, looking upon himself as almost already king, had set his mother's authority at defiance, and left Paris for Brussels, with the view of taking counsel with the Duke of Lorraine as to what he ought to do. When the falsehood of the intelligence about Charles was discovered, he and the advisers by whom he was attended resolved upon going to the Hague; "and when they had wearied all people there," says Clarendon, "they came to Breda, where the chancellor had met them. The duke himself was so young that he was rather delighted with the journeys he had made than sensible

that he had not entered upon them with reason enough; and they had fortified him with a firm resolution never to acknowledge that he had committed any error." (Ibid., p. 290.) In the end he found himself obliged to return to his mother at Paris, and there he chiefly resided till he attained his twentieth year, when he received a command in the French army, and served for some time under Marshal Turenne. The peace concluded with Cromwell however in October 1655 compelled him, with his elder brother, to quit France; upon which, on the invitation of Don John of Austria, the governor of the Low Countries, he retired thither, and entered the Spanish service. Both he and his brother, the Duke of Gloucester, fought on the Spanish side at the siege of Dunkirk, which surrendered to the French in June 1658.

At the Restoration (May 1660) the Duke of York returned to England with the king, and was immediately made lord-high-admiral and lord-warden of the Cinque Ports. The course of his conduct for the next twenty-five years forms an important part of the public history of his brother's reign, but only the leading incidents can be shortly noticed here. In September 1660, he married Anne, the eldest daughter of the Chancellor Hyde (afterwards Earl of Clarendon), to whom it was affirmed that he had been married, or at least contracted, at Breda about a year before. The lady was at any rate far gone with child when the present marriage took place, and produced a son in about six weeks, a circumstance which makes her father's professed ignorance and want of suspicion as to the whole affair the more extraordinary. For some curious details touching his behaviour upon the matter was first communicated to him by the king, his 'Life,' written by himself, may be consulted. It is asserted by Burnet that the duke endeavoured to avoid the marriage, and that "he thought to have shaken her from claiming it by great promises and as great threatenings; but she was a woman of great spirit, and would have it known that she was so, let him use her afterwards as he pleased." This is altogether opposed to her father's account, according to whom the duke petitioned the king to give his consent to the marriage with a "passion which was expressed in a very wonderful manner, and with many tears, protesting that if his majesty would not give his consent he would immediately leave the kingdom, and must spend his life in foreign parts." But the delay of the step till so near the last moment does not look much like impatience on the duke's side, and rather gives ground for suspecting that there was some reluctance which it required great exertions to overcome.

The Duke of York took an eager part in promoting the war with Holland, which broke out in the close of 1664, and as lord-high-admiral he assumed the command of the fleet which was fitted out, and which put to sea even before any declaration of hostilities. The motive that has been sometimes assigned for the conduct of both the brothers on this occasion is their wish to crush the Dutch as a Protestant people, and to disable them from interfering to prevent the re-establishment of popery in England. On the 3rd of June 1665, the duke gained a great victory off Harwich over the Dutch fleet commanded by Admiral Opdam, who was killed, and nineteen of whose ships were taken or sunk, with the loss of only one on the part of the English. The death of the Duchess of York took place in the thirty-fourth year of her age, on the 31st of March 1671, hastened, as is supposed, by the neglect, if not the positive ill-usage of her husband, who, notwithstanding his professions of zeal for religion, indulged himself in a large share of the reigning licentiousness, and kept a mistress almost from the date of his marriage. A few months before her death the duchess had signed a declaration of her reconciliation to the ancient religion; and immediately after that event the duke also publicly avowed his conversion to popery, an act which, although his concealed inclinations had been long suspected, did not fail to create a great sensation, especially as, from his brother's want of issue, he was now looked upon as Charles's probable successor on the throne.

When war was anew declared against Holland, in March 1672, the Duke of York again took the chief command at sea. The most remarkable event of this contest was the action fought 28th of May 1672, in Solebay, off the coast of Suffolk, between the combined English and French fleets under the duke and Count D'Estrées, and the Dutch fleet commanded by De Ruyter, who attacked the allies with a very inferior force, and was not driven off till the engagement had lasted the whole day, and the English fleet had been so shattered as to be disabled from pursuing him. The French are accused of having taken little part in the affair; the object of their government, it is conjectured, having been to allow the English and Dutch to destroy each other. On the passing, in the beginning of the following year, of the Test Act, which required all officers, civil and military, to receive the sacrament according to the usage of the Established Church, the duke necessarily resigned both the command of the fleet, in which he was succeeded by Prince Rupert, and the office of lord-high-admiral, which however was assigned to a board of commissioners consisting of his friends and dependants, so that he still remained substantially at the head of the naval affairs of the country. On the 21st of November 1673, he married Mary Beatrix Eleonora, daughter of Alphonso IV., duke of Modena, a lady than only in her fifteenth year. Before concluding this union he had paid his addresses to Susan, Lady Belaysy, daughter of Sir William Armine, Bart., and widow of Sir William Belaysy, the son of Lord Belaysy; but that

affair was broken off, partly by the obstinate Protestantism of the lady, partly by the interference of her father, who gave the king information of what was projected, when Charles sent for his brother and told him that having played the fool in making an unequal marriage once already, he ought to be satisfied without repeating the same thing in his advanced age. The lady was induced to relinquish the claim she had, founded upon a written promise of marriage, and by way of compensation was, 25th of March 1674, created Baroness Belaysie for life. She survived till 1713. On the 4th of November 1677, the duke's daughter Mary, then in her sixteenth year, was, greatly to the public satisfaction, married to her cousin William, prince of Orange, the consent of her father having been obtained to this Protestant alliance by the persuasions of the king, his brother, who represented to him how much he might soften the popular hostility to him on account of his religion by so apparently strong an evidence of his liberality.

During the excitement produced by Titus Oates's Popish Plot, in 1678-79, the Duke of York, by the advice of his brother, retired to the continent, and he resided at Brussels with his wife and his youngest daughter for five or six months. While he was absent the famous bill for his exclusion from the throne was twice read in the Commons, and ordered to be committed, by large majorities, and was only prevented from being passed in that house by the prorogation of the parliament, 27th May 1679. To this date may be assigned the commencement of the open rivalry between the Duke of York and Charles's natural son the Duke of Monmouth, whose popularity with the nation, still more than the presumed partiality of his father, undoubtedly made him a somewhat formidable competitor for the succession, in the actual circumstances of the legitimate heir. For the present however the latter succeeded in maintaining the ascendancy. Returning home in the beginning of September he had the satisfaction of seeing Monmouth removed from his post of captain-general and exiled, while he obtained from the king for himself the government of Scotland. Before he set out for that country however he became involved with other persons of his religion in the discredit of giving countenance to the story of the Meal-Tub Plot, which the Roman Catholics got up with the hope, in which they were grievously disappointed, of counteracting the effects of Oates's pretended discoveries. The share which the duke had in this business only added to the dislike in which he was held by the great body of the nation, and which was still further increased by the bigoted severity of his administration of affairs in Scotland. In November 1730 a new exclusion bill was brought into the House of Commons, but although it was carried through all its stages in that house by great majorities, it was thrown out in the Lords. The bill was again introduced in the lower house in the following January, but the prorogation of the parliament on the 10th of that month, and its dissolution a few days after, prevented the business being proceeded with. A new parliament having met at Oxford in March, the bill was again brought forward there, and again defeated by the same expedient, this the last parliament held by Charles II. having been dissolved after it had sat only seven days.

A visit which the Duke of York paid to London in March 1682, is memorable on account of a disaster which happened to the ship in which he sailed on his return to the north in May: it struck upon a sand-bank near the mouth of the Humber, when the duke and a few of his attendants, among whom was Mr. Churchill, afterwards the great Duke of Marlborough, were the only persons saved. The solicitude the duke was said to have shown on this occasion for the safety of his priests and his dogs contributed considerably to deepen the popular odium of which he was the object. Very soon after this he finally left Scotland, his government of which country had been throughout an oppressive and cruel tyranny, and again taking up his residence at the English court, became his brother's chief counsellor, and, much more than Charles himself, whose increased indolence and infirmities now more than ever indisposed him for exertion—the mainspring and director of the conduct of public affairs. To his instigation are chiefly attributed the general attack upon corporations, the executions of Russell and Sidney, and the other violent and despotic acts which crowd the two closing years of Charles's reign.

On the death of his brother, 6th of February 1685, no opposition was made to the accession of James. In his address to the privy-council he said, "I have been reported to be a man for arbitrary power; but that is not the only story that has been made of me; and I shall make it my endeavour to preserve this government, both in church and state, as it is now by law established." In his very first measures however the new king showed, to borrow the expressions of Hume, "that either he was not sincere in his professions of attachment to the laws, or that he had entertained so lofty an idea of his own legal power, that even his utmost sincerity would tend very little to secure the liberties of the people." He began by issuing a proclamation ordering the customs and excise duties to be paid as usual, although the parliamentary grant of them had expired with the termination of the late reign; and this step, it appears, he took after a secret consultation with the French minister, Barillon, with whom arrangements were soon completed for the continuance of the pension that Charles had received from King Louis, and the general dependence of the government upon that of France. (Sir John Dalrymple, 'Memoirs of Great

Britain,' Appendix, part I., pp. 100-113, and Fox, 'History of the Early Part of the Reign of James II.'). In another direction James made an equally offensive display of his principles, by going openly and in great state to the illegal celebration of the mass; he even lost no time in sending an agent to Rome to make his submissions to the pope and to prepare the way for the readmission of England into the bosom of the Roman Catholic Church.

He determined however to call a parliament, for reasons which he explained to Barillon partly in person, partly through the Earl of Rochester, lord treasurer. "Hereafter," said he, "it will be much more easy for me to put off the assembling of parliament, or to maintain myself by other means which may appear more convenient for me. . . . I know the English; you must not show them any fear in the beginning. . . . I will take good care to hinder parliament from meddling in foreign affairs, and will put an end to the session as soon as I see the members show any ill will." By the mouth of Rochester, he observed in addition that he would be too chargeable to Louis if he should be obliged to come to him for all the supplies he at present wanted; what he was doing did not however exempt him from also having recourse to the French king for some assistance; he hoped that in the difficult beginning of his reign Louis would help him to support the weight of it; that this fresh obligation would engage him still more not to depart from the road which he used to think the deceased king his brother should have kept with regard to the French monarch; and would be the means of making him independent of parliament, and putting him in a condition to support himself without the assistance of that body, if they should refuse him the continuation of the revenues which the late king enjoyed. (Barillon's 'Despatch' of the 19th February.) When, a few days after, in compliance with these importunate solicitations, Louis transmitted bills for 500,000 livres, James expressed his gratitude in the most rapturous terms, even shedding tears as he spoke; and Rochester, Sunderland, and Godolphin hastened to Barillon to tell him he had given life to the king their master. It was readily agreed, in requital of Louis's bounty, that the chief obstacle which stood in the way of the seizure by the French king of the Spanish Netherlands should be immediately removed, by the existing treaty between Spain and England being held to have terminated with the death of Charles.

These curious details of its commencement supply the key-note to the whole course of James's disgraceful reign. All that followed flowed naturally from such a beginning. The parliament met according to proclamation on the 19th of May, and, in the usual temper of the nation at the accession of a new sovereign, was found abundantly compliant. The revenue which the king demanded was granted to him for life by the Commons, with little or no debate, and by a unanimous vote; and on almost every other subject that came before it that assembly manifested the same complete subserviency to the wishes of the court; a strong attachment to the Established Church, and a still lingering horror of the popish plot, being the only dispositions on the part of the generality of the members that gave James any trouble in managing them. The influence of the court indeed had been unscrupulously employed in their election, and with so much success that James declared there were not forty of them whom he would not himself have named. A Scottish parliament, which had assembled a few weeks before that of England, responded to all the royal demands in a spirit still more slavish. Scotland indeed, by the unheard-of atrocities of the late king's government, had been now humbled for the moment almost to the point of utter despair. While the two parliaments were still sitting, both England and Scotland were invaded, the former by the Duke of Monmouth, the latter by the Earl of Argyle, both of whom had for some years been exiles in Holland. The disastrous issue of each of these attempts is well known. Argyle, after the dispersion of his few followers, was apprehended and executed at Edinburgh, on the 30th of June. Monmouth, whose landing did not take place till the 11th of that month, by which time Argyle was all but an unattended fugitive, was, after having met in the first instance with a much greater promise of success than his confederate in the north had experienced, defeated, 5th of July, in the decisive battle of Sedgemoor, and being two days after found concealed in a ditch, was brought to London, and delivered to the executioner on the 15th of the same month. His uncle obdurately refused to grant him either his life or even the briefest respite. The suppression of Monmouth's insurrection was followed by the savage military vengeance of Colonel Kirke, and the more revolting enormities of the western 'campaign,' as it was jocularly called by the king, of chief-justice Jeffreys. Between the two the south-western counties were strewn with the corpses and the dismembered limbs of human beings, women as well as men, butchered by the sword or the axe.

When the parliament re-assembled in November, the king told them that in the late crisis he had employed a great many Roman Catholic officers, and that he had, in their favour, by his own authority dispensed with the legal test of conformity to the Established Church to be taken by every person appointed to any public office. This was too much to be borne without some expressions of dissatisfaction and alarm; but the resistance of the House of Commons was exceedingly timid and feeble. A very respectful and submissive address having been answered by the king with great arrogance and violence, nothing further was done in the matter; the supplies were at once voted; and

one of the members, who had ventured to observe, when the king's answer was read, that he hoped they were all Englishmen and not to be frightened by a few hard words, was even sent by a vote to the Tower for his audacity. In the Lords a more formidable opposition seemed to be threatened, to get rid of which the parliament was prorogued after it had sat for little more than a week. One of the acts of this parliament was to extinguish completely the liberty of the press by the revival of an act originally passed for two years in 1662 (the 13 and 14 Car. II., c. 33), and afterwards extended for seven years in 1664 (by the 16 Car. II., c. 8).

James's persevering attempts however to establish the dispensing power, which in the particular instance he chose to begin with was an attack upon the established religion as well as upon the law, eventually involved him in a dispute with the Church, which was productive of the most important consequences. In the beginning of April 1687, he published a declaration at once suspending and dispensing with all the penal laws against Dissenters, and all tests, including even the oaths of allegiance and supremacy, directed to be taken by persons appointed to offices civil or military. In Ireland all places of power under the crown were immediately put into the hands of Catholics. The Earl of Castlemaine was at the same time publicly sent as ambassador extraordinary to Rome, to express the king's obeisance to the pope, and to effect the reconciliation of the kingdom with the holy see. In return the pope sent a nuncio to England, who resided openly in London during the remainder of the reign, and was solemnly received at court, in face of the act of parliament declaring any communication with the pope to be high treason. Four Roman Catholic bishops were consecrated in the king's chapel, and sent to exercise the episcopal function, each in his particular diocese. Even in Scotland and England, as well as in Ireland, offices of all kinds, both in the army and in the state, were now filled with Roman Catholics; even those of the ministers and others who had shown themselves disposed to go farthest along with the king were dismissed, or visibly lost his favour, if they refused to conform to the ancient religion. An attempt had already been made to compel the University of Cambridge to confer a degree of Master of Arts on a Benedictine monk. This was not persevered in; but soon after a vacancy having happened in the presidency of Magdalen College, Oxford, the vice-president and fellows were ordered by royal mandate to fill it up by the election of a person named Farmer, a late convert to popery (for whom was afterwards substituted Parker, bishop of Oxford, who avowed himself a Romanist at heart), and on their refusal were cited before an ecclesiastical commission, and expelled. On the 27th of April 1688, the king published a second declaration of indulgence to Dissenters from the Established church, and commanded it to be read by the clergy immediately after divine services in all the churches. On this Sancroft, archbishop of Canterbury, and six bishops, Lloyd of St. Asaph, Ken of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Trelawny of Bristol, met in the archbishop's palace at Lambeth, the 18th of May, and drew up a petition to the king, representing their aversion to obey the order, for many reasons, and especially because the declaration was founded upon such a dispensing power as parliament had often declared illegal. For this they were all, on the 8th of June, sent to the Tower, and afterwards, on the 29th, brought to trial before the Court of King's Bench, on the charge of publishing a false, fictitious, malicious, pernicious, and seditious libel, when a verdict of Not Guilty was pronounced by the jury, which was received with acclamations by the whole kingdom as a great national deliverance. This defeat however in no degree checked at the moment the infatuated king. To quote the summary of Hume, "He struck out two of the judges, Powel and Holloway, who had appeared to favour the bishops; he issued orders to prosecute all those clergymen who had not read his declaration, that is, the whole Church of England, two hundred excepted; he sent a mandate to the new Fellows whom he had obtruded on Magdalen College to elect for president, in the room of Parker lately deceased, one Gifford, a Doctor of the Sorbonne, and titular bishop of Madaura: and he is even said to have nominated the same person to the see of Oxford." It was in the midst of this great contest with the Church and the nation that, on the 10th of June, a son was announced to have been born to James, a piece of intelligence which was very generally received with a strong suspicion that the child was supposititious and that the queen had never been delivered or pregnant at all. For this notion however it is now generally admitted that there was no good ground.

James's son-in-law, the Prince of Orange, had not been an unobscrvant spectator of what was passing in England, and to him the hopes of the English parties were now very generally turned. The heads of the several parties in the state, though probably with no great definiteness or complete union of views, joined in applying to him for his assistance to save the public liberties; and he at last made up his mind to comply with their solicitations. Having set sail with a fleet of about 50 men-of-war and 300 transports, on board of which was a land force of about 14,000 men, he landed, on the 5th of November, at Wrexham, in Torbay, Devonshire. Before the end of that month James found himself nearly deserted by everybody; all were gone over to the prince, the people, the gentry, the nobility, the army, his immediate servants and friends, even his children. In the

night of the 12th of December, having previously sent over the queen and the young prince to France, he embarked with a single attendant in a boat at Whitehall Stairs, with the intention of proceeding to the same country, but was driven back by contrary winds, and forced the next day to land at Faversham, from which he returned on the 16th to Whitehall. The next day the Prince of Orange, having arrived with his army in London, desired James to leave the palace, on which he proceeded to Rochester, and on the 23rd embarked on that port on board a frigate, in which he was conveyed to Ambleuse in Brittany. Hence he repaired to St. Germain, where Louis XIV. received him with great kindness, gave him the castle of St. Germain for his residence, and settled on him a revenue sufficient to support the expenses of his small court.

Meanwhile the English crown was settled upon the Prince and Princess of Orange as King William III. and Queen Mary. [WILLIAM III.] In the beginning of March in the following year James, having sailed from Brest, landed at Kinsale, and thence immediately marched to Dublin, with a small force with which he had been supplied by the French king. A few weeks after he laid siege to Londonderry, which however he was not able to reduce, although his forces continued to encompass it for three months before it was relieved. He himself, returning to Dublin, held a parliament, and for some time continued to exercise the rights of sovereignty in that capital; but after various military operations, the detail of which belongs properly to the history of the next reign, his cause was finally ruined by the signal defeat which he received from King William in person at the battle of the Boyne, fought on the 1st of July 1690. He soon after returned to France, and continued to reside at St. Germain till his death, September 6th 1701.

By his first wife, Anne Hyde, James II. had the following children:—1, Charles, duke of Cambridge, born at Worcester House in the Strand, October 22nd, 1660, died May 5th, 1661; 2, Mary, afterwards queen of England; 3, James, duke of Cambridge, born July 12th, 1663, died June 20th, 1667; 4, Charles, duke of Cambridge, born July 4th, 1664, died May 22nd, 1667; 5, Anne, afterwards queen of England; 6, Edgar, duke of Cambridge, born September 14th, 1667, died June 8th, 1671; 7, Henrietta, born January 13th, died November 15th, 1669; and, 8, Catherine, born February 9th, died December 5th, 1671. By his second wife, Mary of Modena, who survived till the 8th of May 1718, he had—9, Charles, duke of Cambridge, born November 7th, died December 12th, 1677; 10, Catherine Laura, born January 10th, died October 4th, 1675; 11, Isabella, born August 23th, 1676, died March 2nd, 1681; 12, Charlotte Maria, born August 15th, died October 6th, 1682; 13, James Francis Edward, prince of Wales, styled the Elder Pretender, born June 10th, 1688, died at Rome December 30th, 1765; and, 14, Maria Louisa Teresa, born at St. Germain, June 23th, 1692, died April 8th, 1712. He had also the following illegitimate issue:—1, By Arabella, sister of John Churchill, afterwards duke of Marlborough, Henrietta, born 1670, married Sir Henry Waldegrave, afterwards created Baron Waldegrave, died April 3rd, 1730; 2, by the same, James, surnamed Fitzjames, born in 1671, created Duke of Berwick in 1687, died June 12th, 1734; 3, by the same, Henry Fitzjames, styled the Grand Prior, born 1673, died December 7th, 1702; 4, by the same, a daughter, who became a nun in France; 5, by Catherine, daughter of Sir Charles Sedley, created in 1686 Countess of Dorchester for life, Catherine, born 1681, married 1699 to James Annesley, earl of Anglesey; secondly, after having obtained a divorce from him, to John Sheffield, duke of Buckingham; died in 1735.

James II. employed part of the leisure of his retirement in writing an account of his own life, the original manuscript of which, extending to nine folio volumes, was preserved in the Scotch College at Paris till the revolution, when it was forwarded to St. Omer for the purpose of being transmitted to England; but was there destroyed, having, it is said, been committed to the flames by the wife of the person to whose charge it was consigned, in her fears for the safety of her husband if it should be found in his possession. A digest or compendium however of the matter of the royal autobiography had been long before drawn up by an unknown hand, apparently under the direction either of James or his son; and this performance (of which there was also at least one other complete copy in existence), having formed the principal portion of the papers formerly belonging to the Stuart family which were obtained by George IV. when regent, has been printed under the title of 'The Life of James the Second, King of England, &c., collected out of Memoirs writ of his own hand. Together with the King's Advice to his Son, and his Majesty's Will. Published from the Original Stuart Manuscripts in Carlton House, by the Rev. J. S. Clarke, LL.B., F.R.S., Historiographer to the King, &c., 2 vols. 4to, London, 1816. We need hardly point attention to the light thrown on the character of James, and the events of the latter part of his reign, by Macaulay, in vol. i. of his 'History of England.'

* JAMES, GEORGE PAYNE RAINSFORD, a novelist, a poet, and a historian, was born in 1801 in George Street, Hanover Square, London, of an ancient family originally of Staffordshire. He was educated at a school in Greenwich, whence he was early sent to France, where he remained several years. Even in his youth he distinguished himself by a love for literary pursuits, and as he himself says, "before seventeen summers had passed over his head," produced a series of seven eastern tales entitled the 'String of Pearls,' which was published in

2 vols. in 1832. The copyright was given to the Royal Literary Fund, and produced 75*l.* for the benefit of that institution. Mr. James also contributed anonymously to the magazines and reviews, till in 1825, encouraged by the praises of Washington Irving and Sir Walter Scott, he produced under his own name the novel of 'Richelieu.' The historical novels of Scott had made the species popular, and, though it was too palpably an imitation, it met with considerable success. From this time he continued to pour forth works in rapid succession. Of his novels the best are 'Richelieu,' 'Darnley,' 'Philip Augustus,' and 'Henry Masterman.' He also wrote histories of 'Charlemagne,' the 'Black Prince,' 'Lives of Foreign Statesmen,' and others. His poems are of varied character, as the 'Ruined City,' 'Camaralzaman,' a humorous and fanciful fairy tale. King William IV. nominated him Historiographer of England, an office which he almost immediately resigned. In 1852 he was made British consul at Norfolk in Virginia, in which capacity he still resides there. His fame as a novelist had spread across the Atlantic, and he was warmly welcomed in America, where, in conjunction with Mr. M. B. Field, an American, 'Adrian, or the Clouds of the Mind,' a romance, was produced, in imitation they say of Beaumont and Fletcher. The work was published in London in 1852, but is more remarkable for the peculiarity of the design than for its excellence.

In all his works Mr. James shows facility in writing; he is seldom dull, and as seldom original. In his historical novels he laboriously interweaves all the external characteristics of the period of which he is treating, but he fails in grasping the animating spirit, and his descriptions are frequently too minute. He has a good eye for nature, and his descriptions of scenery are often vividly brought before the mind. A similar talent is shown in his poetry: the versification is fluent, but the imagination is not of a high order. In his histories he has usually chosen interesting subjects, and has produced interesting books, without much research and with not very scrupulous accuracy.

JAMES, SAINT. There are at least two individuals of the name of James mentioned in the New Testament.

1. **JAMES**, one of the Apostles, son of Zebedee, and brother of the apostle John (Matt. iv. 21, x. 29; Mark, i. 19, 29, iii. 17, x. 85, xiii. 3; Luke, v. 10, vi. 14, ix. 54; Acts, i. 13), who was chosen with Peter and John to accompany Christ to the Mount of Transfiguration (Luke, viii. 51; Matt. xvii. 1). He was beheaded at Jerusalem by order of Herod Agrippa about A.D. 44 (Acts, xii. 1, 2). He could not have been the author of the book of the New Testament called the Epistle of St. James, since it bears marks of having been written at a later period.

2. **JAMES 'the Less,'** as he is called in Mark, xv. 40, the son of Alphaeus and Mary (Matthew, x. 3, xvii. 56; Mark, xv. 40), was also one of the Apostles (Matthew, x. 3; Mark, iii. 18; Luke, vi. 15; Acts, i. 13).

There is also mentioned in the New Testament a James, a brother of Jesus (Matt. xiii. 55; Mark, vi. 3), who, according to Josephus ('Antiq.,' xx. 9, § 1), was put to death by the high priest Ananias about A.D. 62 or 63. He was probably the same individual as the James who appears to have had the greatest influence in the Church at Jerusalem (Acts, xv. 13, xxi. 18; Gal. ii. 12); and who, according to ecclesiastical tradition, was the first bishop of that Church. Since James is also mentioned by St. Paul (Gal. i. 19) as one of the Apostles, and as the Lord's brother, we meet with three individuals of the name of James who are said to be Apostles; which differs from the lists of the Apostles given in the Gospels. It was therefore supposed by the fathers, and has also been maintained by most modern divines, that James the son of Alphaeus was the same person as James the brother of our Lord; and that the Greek word (*ἀδελφός*), which is translated 'brother' in our version, is used, like the Hebrew *אָח*, in the sense of 'cousin.' The epistle is almost universally attributed to this James by the Fathers and modern critics; it was probably written shortly before his death.

The epistle is addressed to all the Jewish Christians "which are scattered abroad" (i. 1); and its principal object is to exhort them to perseverance, to inculcate several moral lessons of great importance, and especially to explain the doctrine of justification by faith, which many persons appear to have misunderstood.

The canonical authority of this epistle has been much disputed. Clement of Rome (1 Corinth. x.) and Irenæus ('Hæres.,' iv. 16, § 2) had probably read it, but they do not quote it as of inspired authority. Eusebius places it among the 'Antilegomena,' that is, writings which were not generally received, and also mentions several doubts which were entertained against it. Origen speaks of it as the Epistle said to be written by St. James. After this period it was generally received by the Church till the time of the Reformation, when its canonical authority was rejected by Luther and several other Reformers on account of the difference, real or supposed, which was thought to subsist between the writings of St. Paul and those of St. James, in reference to the doctrine of justification by faith. The principal argument in favour of the canonical authority of this epistle is in its forming part of the Peshito, that is, the Syriac version of the New Testament, which was made at the latter end of the 1st or the beginning of the 2nd century of the Christian era.

The Introductions of Eichhorn, De Wette, Hug, Michaelis, and

Horne; Herder, *Briefe zweener Brüder Jesu, 1775*; and the Commentaries of Schulthessius (1828), Gebser (1828), Schneckenburger (1832), Theile (1833), &c.)

* **JAMESON, ANNA**, one of our most distinguished female writers on art and general literature, is a native of Dublin, where she was born near the close of the last century. From her father, Mr. Murphy, an artist of considerable ability, she derived her early love of art and knowledge of its technicalities; but an excellent education and diligent self-culture have enabled her to avail herself of unusual opportunities for extending her æsthetic attainments, and to take one of the highest places among contemporary English writers on the Fine Arts. Miss Murphy married a barrister named Jameson, who, having accepted an official appointment, removed to Canada. Mrs. Jameson subsequently followed him; but circumstances having led to a separation, Mrs. Jameson returned to England, and devoted herself to the study of literature and art.

Her earliest appearance as an author was by the publication, anonymously, in 1826, of 'The Diary of an Ennuyée,' a collection of notes of travel in France and Italy; of which an enlarged and greatly improved edition (in 4 vols. 12mo, 1834) appeared some years later under the title of 'Visits and Sketches at Home and Abroad.' In 1829 she published a series of imaginative sketches, intended to exhibit the influence of female character on poetic minds, under the title of 'Loves of the Poets.' This was followed in 1831 by 'Memoirs of Celebrated Female Sovereigns,' 2 vols.; to which succeeded, in 1832, a work more akin to the 'Loves of the Poets,' but of a higher order of merit, 'Characteristics of Women—moral, historical, and political,' 2 vols., an analysis of the principal female characters in the plays of Shakspeare, displaying much of the subtle criticism and refined observation which have been so eminently evinced in her later æsthetic writings: we may notice that the British Museum possesses a copy of this work with manuscript notes by L. Tieck. Her next work was 'The Beauties of the Court of Charles II.' (2 vols. 4to, 1833), a series of biographical sketches written to accompany engravings from copies made by her father of Lely's celebrated portraits at Hampton Court. In 1838 the versatility of her pen was exhibited in a record of her Canadian 'Winter Studies and Summer Rambles.' In 1840 appeared a translation by her of some dramas by the Princess Amelia of Saxony, with whom she had become acquainted during her residence in Germany. Mrs. Jameson's great artistic knowledge had been well known in art circles; she had contributed various papers on art to the periodicals, and she had printed at Frankfurt in 1837, a small volume entitled 'Sketches of Germany—Art, Literature, Character;' but it first became generally recognised on the publication, in 1842, of a 'Handbook to the Public Galleries of Art in and near London,' which was followed in 1844 by a 'Companion to the most celebrated Private Galleries of Art in London;' and to this succeeded a very pleasing series of 'Lives of the Early Italian Painters,' from Cimabue to Bassano, which formed two of Mr. Knight's 'Weekly Volumes.' In 1846 she collected a number of scattered essays—chiefly on art, but including some on literature and social morals—into a volume, entitled 'Memoirs and Essays.' This was followed in 1848 by the most elaborate work she had yet given to the world—'The Poetry of Sacred and Legendary Art,' 2 vols. 8vo. This, the first of a series on which she had been engaged for several years, was an expansion of some papers which appeared in the 'Athenæum' during the years 1845-46. The other volumes of the series followed—'Legends of the Monastic Orders' in 1850, and 'Legends of the Madonna' in 1852. They thus afforded a pretty complete exposition of the various phases, the poetry, and the symbolism—the literature and the legends—the æsthetics rather than the polemics—of the art which sought to do honour to the Church of the middle ages; and she has endeavoured to show the inner significance, rather than—what is commonly only thought of by observers and critics—the technical qualities of such works. These volumes at once took the place they had fairly earned, of standard works on subjects which had been singularly neglected by English literature. They are indeed works of a very superior order of merit—marked throughout by extensive research, by familiarity with the great productions in the realm of art which they were designed to elucidate, and by a highly refined taste and delicate tact; and readers felt that the beautiful drawings and etchings (Mrs. Jameson's own handiwork), while they afforded corroborative evidence of the technical knowledge and skill of the authoress, really added a new charm to the book. Her next publication on art (it is hardly necessary so to distinguish her useful little 'Handbook to the Courts of Modern Sculpture in the Crystal Palace') was 'A commonplace Book of Thoughts, Memories, and Fancies, Original and Selected' (1854), a gathering-up of the fragments left from the feast she had already presented to the public. Since then no separate work on art has appeared from her pen; but both by voice and pen—in lectures, addresses, and pamphlets—she has been labouring earnestly in directing to a higher and better purpose the thoughts, energies, sympathies, and capabilities of her sex; or, to use her own words, in seeking to ascertain "whether there be any hope or possibility of organising into some wise and recognised system the talent and energy, the piety and tenderness of our women for the good of the whole community." These labours may divert her attention perhaps from the graceful studies by which she has made her name celebrated, but if she

succeed in her purpose neither herself nor the world will regret the transference of her exertions.

JAMESONE, GEORGE, called by Walpole the Vandyck of Scotland, was the son of Andrew Jamesone, an architect, and was born at Aberdeen in 1586. Jamesone and Vandyck were about 1616 fellow-pupils of Rubens at Antwerp. When Charles I. visited Edinburgh in 1633, he sat to Jamesone, and presented him with a diamond ring from his own finger. His career is not exactly known, but it must have been a successful one, for he left his wife and family well provided for at his death in 1644; and he bequeathed also much in other directions. He was probably in Italy, for his portrait is in the painter's portrait gallery at Florence; he travelled in company with Sir Colin Campbell of Glenorchy. Many of the considerable families of Scotland possess portraits by Jamesone, but the greatest collection is at Taymouth, the seat of the Marquis of Breadalbane. Sir Colin Campbell, the marquis's ancestor, was Jamesone's first and chief patron. In a manuscript containing the genealogy of the house of Glenorchy, there is mention of several portraits painted by Jamesone for Sir Colin, with memoranda of the prices paid. For portraits of the kings David and Robert Bruce, Charles I. and his queen, and for nine queens of Scotland, painted in 1635, Jamesone received only 260 Scotch pounds, or 20 pounds per portrait, which is equal to 11. 13s. 4d. sterling; the Scotch pound being twenty pence. All other portraits painted for Sir Colin, which were many, were paid for at the same rate. There are several of Jamesone's pictures also in the two colleges of Aberdeen. A portrait of Jamesone by himself is at Cullen House. He appears to have often painted his own portrait, and he always painted himself with his hat on, which he may have done either in imitation of Rubens, or on having been granted that privilege by Charles I. when he sat to him.

Though the pupil of Rubens and the companion of Vandyck, Jamesone's works have neither the fulness nor richness of the former, nor the vigour of the latter. They are painted very thinly, yet with much nature, but there is a sharpness in his outline which reminds of a very different school from that of Rubens. "His excellence," says Walpole, "is said to consist in delicacy and softness, with a clear and beautiful colouring, his shades not charged but helped by varnish (*glazing?*), with little appearance of the pencil." Jamesone's earliest works are painted on panel; he used afterwards fine canvas, smoothly primed, and prepared in a shade tint. He painted occasionally history, miniature, and landscape. Walpole mentions a view of Edinburgh by him.

Cunningham has ascribed to Jamesone the illuminations of a manuscript of two hundred leaves of parchment, illustrating the Life of Christ, which belonged to Jamesone, and which he valued at 200*l.* sterling. Jamesone himself describes it as a manuscript in his possession "containing two hundred leaves of parchment of excellent write adorned with diverse histories of our Saviour curiously limned." This memorandum was in the possession of his descendant, Mr. John Jamesone, a wine merchant of Leith, from whom Walpole (or rather Vertue) obtained the particulars of his account of Jamesone. It is not known what has become of this manuscript.

Cunningham speaks of Jamesone as without a native rival in Great Britain; he appears to have overlooked Dobson, some of whose heads not only approach but equal Vandyck's. Jamesone's daughter Mary excelled in embroidery, in textile paintings; some of her works are still preserved in the church of St. Nicolas, at Aberdeen.

JAMIESON, JOHN, D.D. (so he himself spelt the name, though he made his children drop the *s*), was born March 3, 1759, in Glasgow, where his father, the Rev. John Jameson, was pastor of one of the two congregations of Seceders, which then comprised all the persons of their denomination in that city. The subject of the present notice remained throughout his life a steady, but by no means a narrow-minded Seceder. His mother's relations, the Bruces of Kennet in Clackmannan, early introduced him extensively into general society, and his literary tastes and associations further helped to liberalise him. Yet even long after he numbered among his intimate acquaintances and friends many persons of great eminence and influence, and had become known in literature, his worldly circumstances continued extremely narrow. The chronology of his life may be given in a few sentences. He was sent to the University of Glasgow when he was only nine years old, an unusually early age for the commencement of academic education even in Scotland. The urgent motive in this case seems to have been not any extraordinary precocity, or appearance of precocity, in the boy, so much as the anxiety of his father, who had no other son surviving and nothing to leave to his family, to see him established as a clergyman before he should be himself, and he was in very broken health, removed from the world. He commenced the study of theology at the age of fourteen, under the Rev. William Moncrieff, who lectured on that subject to the young men intended for the Secession ministry, at Alloa. After having been a session at Alloa however he attended the lectures of Dugald Stewart in the University of Edinburgh. In July 1779, having just completed his twentieth year, he was licensed as a preacher by the Seceder Presbytery of Glasgow. For some time he was employed, as the practice in his communion was, to do duty without any pastoral appointment; first at Colmonell in Ayrshire, then in the Isle of Bute, then at Cowal in Argyllshire, then at various places in Perthshire. At last he received at the same time calls, or popular invitations, from congregations in

Forfar, Dundee, and Perth; upon which the synod appointed him to that at Forfar, the poorest and in all other respects the least desirable of the three. Here he managed to exist upon an uncertain stipend of fifty pounds a year, for a dozen years or more. About a year after settling at Forfar, he married, and he soon had a numerous family. While thus situated he made several journeys to London, and both there and in Scotland formed many literary acquaintanceships. He had when very young contributed some verses to Ruddiman's 'Weekly Magazine,' and he had also communicated some papers on the antiquities of Forfarshire to the Literary and Antiquarian Society of Perth, of which he was a member; but he first properly came out as an author in 1786, when he published, under the title of 'Socinianism Unmasked,' an examination of certain opinions deemed heretical which had been promulgated through the press by Dr. Macgill, one of the established ministers of Ayr. This work procured him considerable reputation in the religious world, and it was followed in 1789 by 'The Sorrows of Slavery, a poem;' in 1790 by two octavo volumes of 'Sermons on the Heart;' and in 1791 by 'Congal and Fenella,' a metrical tale, in two parts.

After he had been ten or twelve years at Forfar he received a call to be their pastor from the Seceder congregation of Nicolson-street, Edinburgh, which however the synod would not allow him to accept. But when, a few years after, he was again unanimously invited by the same congregation, the synod did not make any further opposition; and he accordingly removed to the Scottish metropolis with its literary society and other advantages of position, and exchanged his fifty pounds a year for an income of perhaps four times the amount. In this situation Jamieson remained for the rest of his life. To the last much of his time continued to be given to literature; and in addition to the works already mentioned he published, among others of a slighter nature, in 1795, 'A Reply to Dr. Priestley,' in 2 vols. 8vo.; in 1798, 'Eternity,' a poem; in 1799, 'Remarks on Rowland Hill's Journal;' in 1802, 'The Use of Sacred History,' in 2 vols. 8vo.; in 1806, 'An important Trial in the Court of Conscience;' in 1808, his 'Etymological Dictionary of the Scottish Language,' in 2 vols. 4to.; in 1818, 'An Abridgment of the Scottish Dictionary,' in 1 vol. 8vo.; in 1811, 'An Historical Account of the Ancient Culdees of Iona;' in 1814, 'Hermes Scythicus, or the Radical Affinities of the Greek and Latin Languages to the Gothic,' 8vo.; in 1825, a 'Supplement to his Scottish Dictionary,' in 2 vols. 4to.; and subsequently, 'An Historical Account of the Royal Palaces of Scotland.' He also produced, in 1820, an edition of Barbour's poem of 'The Bruce,' and Harry the Minstrel's 'Sir William Wallace,' in 2 vols. 4to. Here then was at any rate no want of industry. Neither Jamieson's learning however, nor his critical acuteness, was of a high order; and scarcely anything that he has done, with the exception of his 'Scottish Dictionary,' retains much value. His 'Hermes Scythicus' is founded upon a mere examination of the vocabularies of some of the northern languages, and has been long superseded. Nor has his 'Dictionary' (of which a second edition has been published) any merit as a critical performance; but it is valuable as by far the most extensive collection that has been formed, both of old words and phrases, and of notices of old customs, peculiar to Scotland, a large portion of the matter it contains being derived from the people themselves, their conversation and traditions, and being thus rescued from the probably imminent danger of irrecoverable oblivion.

Jamieson early in life received the diploma of a Doctor in Divinity from the college of New Jersey in the United States; he was for many years secretary to the Society of Scottish Antiquaries; and he received a pension of 100*l.* a year as an associate of the Royal Society of Literature from its institution till the general withdrawal of the allowances on the accession of William IV. In 1833 a pension to the same amount was assigned to him from the civil list. He died at Edinburgh on the 12th of July 1838.

* JANIN, JULES-GABRIEL, a popular French critic, was born at St. Etienne, in the department of La Loire, on the 11th of December 1804. He received his earliest instruction from his father; he then spent two years at school at Lyon, after which he was sent to complete his education at the College Louis-le-Grand in Paris. Early in 1823, within a few months after his leaving college, Janin became a contributor to the 'Figaro,' in which journal he continued to write his squibs, pasquinades, and personal lampoons, until it was suppressed by the government in 1825. Janin was engaged to write for the 'Messenger des Chambres,' in 1827, and he now began to acquire fame and influence, by the vivacity of his style, and the fearless manner in which he distributed both praise and blame. In 1828-29 his vigorous attacks on the despotic administrations of Charles X., stimulated the Polignac ministry, who had been the principal objects of his satire, to take proceedings against the 'Messenger,' which was fined for the abuse. But Janin, though he denounced the aggression of power, was then, and still is, a supporter of Conservative principles, both in literature and politics. As soon therefore as the new Romantic school began to rebel against the established rules of authorship, Janin singled out their leader, Victor Hugo, and ridiculed him in a parody, called 'L'Ané mort et la femme guillotinée,' which appeared with great success in 1829. In all the papers and periodicals to which his fertile pen has since contributed something daily, Jules Janin has pursued the same course. When he began these hostilities, and exposed the false taste

which was disfiguring the literature and demoralising the stage of his country, Janin was only twenty-five years old; yet even then he was recognised as the leader of the defenders of the Classic school, and won from Rabbe the name of Prince of Critics. In 1830 he published a romance, called 'La Confession;' and in 1831 'Barnave.' But Janin, though a severe critic of others, is essentially an 'improvisator' himself. A collection of short tales, contributed by him to different periodicals, was published in 1832 under the title of 'Contes Fantastiques;' and a second series followed in 1833, called 'Contes Nouveaux,' the interest of which was much increased by an interesting autobiography, of considerable length, affixed to the work.

It was likewise in 1833 that Jules Janin began to write those dramatic notices and literary reviews for the 'Journal des Débats,' which, in spite of some levity in the manner, and too much expedition in the work, have established his reputation as the most sagacious and intuitive among the living critics of France, apart from the domains of science and philosophy. He has held this position in the 'Débats,' without any interruption, for twenty-three years, having, during that long period, produced nearly 1200 dramatic notices alone, and introduced several aspirants—among others Mademoiselle Rachel—to fame and fortune. Nor has he confined his writing to the feuilletons or foot articles: he has written a great number of biographies and not a few 'leaders' for the 'Messager des Chambres,' the 'Quotidienne,' and the 'Journal des Débats.' If he writes fast, he reads slowly; and his memory, which is very active, never appears in fault. His friends and intimates consider him a man of erudition; nor would it be easy to account for the immense variety of subjects he has treated, and treated successfully, without in some degree sharing in that opinion. No contemporary French author has been more frequently employed by French publishers to edit the republications of the old masters, to all of which Janin has affixed prefaces, biographies, and essays on the merits of the eminent authors reissued. In all these introductions, his brilliant and vivacious pen continues to annoy the reader with its wonted frivolity; yet the information contained in them is often interesting and valuable. Several might be named as of considerable merit, but it will suffice to name that prefixed to the illustrated edition of Le Sage, which is a piece of writing of very unusual ability. Janin's romance, 'Le Chemin de Traverser,' which has since become popular in France, appeared in 1841; 'Un Hiver à Paris,' in 1842; in which year he also produced an illustrated serial, in fifty numbers, called 'La Normandie Historique.' After this he published 'Le Prince Royal,' a tribute to the memory of the Duke of Orleans, who was killed by falling from his carriage, July 13, 1842. His 'Clarisse Harlowe,' an absurd abridgment of Richardson's novel, reduced to two volumes, came out in 1846; 'La Religieuse de Toulouse,' was published in 1850.

Janin, who was one of the founders of the 'Revue de Paris,' contributed to it his racy sketches of Mirabeau and Lord Byron, besides a most interesting description of Saint Etienne, his native town. His extremely clever sketches of 'la Grisette,' 'le Gamin de Paris,' and 'la Devoté,' in 'Les Français peints par eux-mêmes,' have been much admired. By some French writers Janin has been called the successor of Duviquet and Geoffroy, critics of great note during the two preceding generations; but we think he affords a more perfect idea of Diderot, as Marmontel has described him in his 'Memoirs.' He has the same variety of subject; the same singular facility and abundance, affording irrefragable proof of wide reading, if not of deep study; the same retentive memory. Like him his levity often verges on puerility, yet almost every sentence he writes suggests new thoughts to the reader. Jules Janin has lectured in public at the Athénée of Paris with an eloquence which most people expected, but likewise with a seriousness and fulness of matter which took his audience by surprise. In his lectures, as in his criticisms, his style is remarkable for polish and neatness.

Besides the works already named, Janin produced 'Les Fils du Rajah,' in 1834; 'L'Enfance et la Jeunesse de Lyais,' in 1835; 'Un Cœur pour deux Amours,' in 1837; 'Les Catacombes,' 6 vols., in 1839; 'Tableaux Anecdotiques de la Littérature Française depuis François I.;' 'Voyage en Italie,' 1842; 'Biographie de Mademoiselle Mars,' 1843. In 1851 he visited this country, and spent the month of May in London to study the Great Exhibition in Hyde Park; but his letters on this subject were not equal to his general reputation. His dramatic feuilleton in the 'Débats' usually appears every Monday.

JANSSEN, CORNELIUS, was born at Amsterdam, and lived several years in England. He was employed by King James I., and painted several fine portraits of that sovereign and of his children, as well as of the principal nobility. His colouring is very clear and natural; the carnations are remarkably soft; and except in freedom of hand and in grace he was esteemed equal to Vandyck, and in finishing superior to him. He generally painted on panel, and his draperies are commonly black, which he probably chose because that colour gives greater brightness to the flesh-tints. His pictures still retain their original lustre, which is supposed to be in consequence of his having used ultramarine in his black colours, as well as in the carnations. He left England soon after the arrival of Vandyck, about the beginning of the civil wars, and returned to his own country, where he died in 1665.

JANSSENS, ABRAHAM, born at Antwerp in 1569, was a com-

petitor of Rubens, and was considered to be equal to him in many of the most important parts of the art. In colouring he was regarded as inferior to Rubens alone. His compositions are spirited, his drawing correct, his pencil decided, and his draperies natural and free from stiffness. He painted subjects illuminated by torchlight, and delighted in the contrast of the most brilliant light with the deepest shade. Most of the Flemish churches possess fine pictures by this master.

JANSSENS, VICTOR HONORIUS, born at Brussels in 1664, after having been for four years painter to the Duke of Holstein, was sent by his highness at his own request to Italy, where he diligently studied Raffaele and the antique, and sketched the beautiful scenery in the environs of Rome. His paintings were soon so highly esteemed that he was employed by the chief nobility of Rome. He composed historical subjects both on a large and small scale, but, the latter being most sought after, he in general painted in that size. He took Albano for his model, and was superior in his own style to all his contemporaries. On his return to Brussels his pictures were as much admired there as they had been in Italy; but having a large family to support, he found it most profitable to paint large pictures, and most of the palaces and churches of his own country are adorned with his compositions. His invention was fruitful, and his execution rapid, as appears from the vast number of his works. He died in 1739.

JAPIX (or JAPICK, or JAPIKS), GYSBERT, a Frisian poet, of whom we are told by Dr. J. H. Halbertsma, the most eminent living Frisian author, that his productions are masterpieces of artless nature, with wonderful power of expression, and that "for any one who has a feeling for true poetry, it is worth the trouble to learn Frisian to enjoy the beauties of Gysbert Japix." He was born at Bolsward, a town of Friesland, in 1603, and was the son of a joiner named Jacob Gysbert, from whom he took his name, Japix being the Frisian for Jacob's, or son of Jacob. The family name was Holckama, but it does not appear to have been assumed otherwise than in official documents by either father or son. Little is known of the biography of Gysbert till 1637, when he became schoolmaster at Bolsward, and also clerk to a congregation there, and these offices he retained to the end of his life. He was married, and had six children, five of whom he lost in succession by death; and the remaining one, Salves, whom he brought up as a surgeon, turned out so dissipated and extravagant that his father was ruined by having to pay his debts. The son died in 1666 of the plague, which ravaged Friesland a year after the great plague of London, and in a few days after his father and mother were carried off by the same epidemic.

Japix was noted during his life for his warm affection for his native tongue, the Frisian, which at that time appeared likely to disappear in a few generations before the advance of Dutch. A story is told by the biographers of Francis Junius the younger, the great philologist, that Junius, on hearing in the course of his studies in Anglo-Saxon that a language closely akin to it was still spoken in a corner of Holland, left England in search of it, and took up his residence for two or three years in Bolsward to make himself master of the idiom. The Dutch investigator J. W. de Crane has disproved some of the particulars of this story; but it is well established that Junius made visits to Bolsward to study the Frisian language, and that he was acquainted with Japix. Among the manuscripts which Junius bequeathed to the Bodleian Library, are copies of the principal poems of Japix, including two or three pieces which were unpublished till discovered by Halbertsma, and included in his 'Letterkundige Naoogst.' The first edition of Gysbert's poems was issued after his death, in 1668, under the title of 'Friesche Rymlyery,' by his friend Haringhouck, a bookseller of Bolsward; a second edition, with considerable additions in prose, edited by Gabbema, appeared in 1681. For about a century it remained the only printed book in the modern Frisian language. When Dr. Johnson, in 1763, requested Boswell, who was then studying at Utrecht, to procure for him a specimen of Frisian, Boswell bought a Japix, and observed, in a letter on the subject, "It is the only book they have; it is amazing that they have no translation of the Bible, no treatises of devotion, nor even any of the ballads and story-books which are so agreeable to country-people." The literature of Friesland has since considerably increased; but it is still one of the very few European languages which have no translation of any portion of the Scriptures, though it possesses one of the 'Merchant of Venice' and 'Julius Caesar.' Japix is still, we believe, the only author in the language who has reached a second edition. A third edition, the most valuable and complete of all, was published by Epkema in 1821, and was followed in 1824 by a Dictionary, compiled by the editor, of the words used by Japix, many of which are now obsolete. A fourth, issued at Franeker in 1855, is accommodated by the editor (Dykstra) to the new system of Frisian orthography proposed by Halbertsma. The poems are divided into three parts, the first and second consisting of miscellaneous songs and poems, and the third of translations of some of the Psalms of David. The prose works are chiefly translations from the French, fragments relating to the Frisian language, and familiar letters. An animated translation of several of the poems into English was given by Sir John Bowring in 1829, in an article in the 'Foreign Quarterly Review.' The enthusiasm for the works of Japix has been wonderfully revived among the Frisians of this generation. In 1823 a bust of him was erected in St. Martin's church at Bolsward by public subscription, and an account of the proceedings

on the occasion was published in an octavo volume, entitled 'Hulde aan Gysbert Japiks' ('Homage to Gysbert Japix'), from which most of the particulars here related have been taken.

JARDYN, KAREL DE, one of the best of the Dutch landscape, pastoral, and genre painters, and the most distinguished of N. Berghem's scholars. He was a native of Amsterdam, and lived some time in Rome, where the Flemish painters gave him the nickname of Bokkebaart (goat-beard). He died at Venice in 1678, aged about forty. There are many spirited etchings by his hand. (*Houbraken, Grote Schouburg, &c.*; Bartsch, *Peintre-Graveur.*)

JASMIN, JACQUES, the popular poet of Gascony, whose verses have been so much the subject of praise for thirty years in France, was born at Agen, department of Lot-et-Garonne, March 6th, 1798. So poor were his parents and kindred that he speaks in his 'Mous Soubein' ('My Recollections') of his aged grandfather as an inmate of the poorhouse during his latter days. Jasmin's education was very circumscribed: while quite a youth he began to practise the trade of barber and hairdresser, in which calling, notwithstanding his subsequent success as a poet, he has ever since continued. All his songs and poems have been composed in the patois, or country dialect, spoken by the peasantry on the banks of the Garonne, which in its purest state is understood to be the same as the old Provençal, the language of the wandering troubadours of the 11th and 12th centuries. Jasmin made rhymes for many years before he thought of publishing them. His first publication was 'Lou Chalibri,' ('The Charivari'), a burlesque poem, which appeared in 1826. His next work was produced by slow degrees during a space of ten years, some of it as early as 1826 by his recitations to his friends, and the conclusion in 1835, when the whole was published in 2 vols., under the title of 'Las Papillotes' ('The Curl Papers'). About the same time he was elected a member of the academies of Agen and Bourdeaux. When he produced his pathetic poem of 'Francounetto,' it was received with the same kindness and eagerness which all the productions of this gifted peasant have obtained from the people of his own district, most familiar with the old Provençal diction he employs, and with no common warmth by the rest of France.

Two of the most distinguished writers of his country, Charles Nodier and Sainte-Beuve, have produced critical examinations of Jasmin's works; in which they acknowledge his great original talents, inclining rather to gaiety than pathos, yet often most happy in those passages where he addresses himself to the feelings. He seems in his retirement from large cities to have formed deep habits of reflection, and there are times when his spirit starts up, and his conceptions take a high soar. His ideas are natural and simple, his language choice and closely drawn together, with here and there a touch of rugged simplicity almost always presenting an image, which would be lost perhaps in a smoother expression.

In 1830 Jasmin produced his 'Ode to Charity,' and in 1833, his animated 'Stanzas to the Scattered Remains of the Polish Nation.' But it was not till 1837 that he gave the full measure of his ability, in his very beautiful and pathetic story of 'L'Abugio de Castel-Cuillé' ('The Blind Girl of Castel-Cuillé'), which, on its publication in that year, immediately took its place at the head of all he had written.

Jacques Jasmin is in the habit of reciting his poems in public, for which his expressive countenance, his natural unstudied delivery, and his earnest action, fit him in an especial manner, considering that his audience usually belongs to the south of France. One of his latest poems, 'Lous dus Frays bessous' ('The Two Twin Brothers'), appeared in 1847, dedicated to M. de Salvandy, one of his patrons. Besides the praise he has received from his private friends and public admirers, Jasmin has been honoured with many marks of favour; Louis Philippe, and the Duke and Duchess of Orléans, sent him handsome presents; the city of Toulouse awarded him a gold laurel; Pau presented him a set of china; and the minister Salvandy created him a knight of the Legion of Honour. He has sometimes been confounded with Reboul, the baker of Nîmes, another poet in humble life, warmly eulogised by the muse of Lamartine. But their style and qualifications are very dissimilar. The poems of Reboul are written in very pure French; they are extremely smooth and highly finished; but they have neither the strength nor originality of the Gascon hairdresser. As yet no distinct biography of Jasmin has appeared. The best account of his early life was given by himself in his 'Recollections,' included in his 'Papillotes.' It appears that all his family, even his wife, discouraged him when he began to write. But afterwards, when the sale of his poems had afforded him the means of buying the house in which he still follows his trade his wife would choose him the best pen and the best paper, saying pithily, "Every verse you write, James, puts a new tile on the roof."

JAVOLENUS PRISCUS, a Roman jurist, from whom there are a few excerpts in the Digest. His period is not quite certain. He is mentioned by Pomponius (Dig. 1, tit. 2, s. 2, § 47) as a successor of Celsus Sabinus, and he accordingly belonged to the Sabinian; and some writers place him in the time of Nerva and Hadrian. He was the master of Salvius Julianus. It may be inferred from a passage of Julianus (Dig. 40, tit. 2, s. 5), that Javolenus some time held the offices of governor of Syria and Africa. He is probably the Javolenus Priscus

mentioned by the younger Pliny ('Ep.' vi. 15), who stopped, by a timely answer, Papienus Paulus from indicting his poetry on him. Javolenus is mentioned by Capitolinus, in his life of Antoninus Pius, as one of the jurists who were the advisers of the emperor; but this would extend his life beyond probable limits: he who was the master of Julianus, who drew up the Edictum Perpetuum under Hadrian, could not have been one of the advisers of Antoninus Pius. According to the Florentine Index, Javolenus wrote fifteen books 'ex Cassio,' that is, Caius Cassius Longinus, fourteen books of Epistols, and five books to Plantius. He was also the author of an Epitome of the Libri Posteriores of Labco, and made notes on them (Dig. 40, tit. 12, s. 42).

JAY, REV. WILLIAM, was born on the 8th of May 1769 at Tisbury, Wiltshire. His father, who was the son of a small farmer, worked as a stone-cutter and mason, and young Jay's first employment was that of mason's boy. While still young he was placed under the tuition of the Rev. Cornelius Winter of Marlborough Academy, an institution connected with the Congregational body in which young men were trained for the ministry. His abilities soon became known, and he began to preach before he was sixteen years of age. For about a year he officiated as the minister of Lady Maxwell's Chapel at the Hotwells, Clifton; and on January 31st 1791 he was settled as pastor of the church assembling in Argyle Chapel, Bath, a position which he maintained for the long period of sixty-two years. Mr. Jay retired from the pastorate in January 1853, and died on the 27th of December in the same year, at the age of eighty-four. His reputation as a preacher was very high, and was by no means confined to his own denomination, that of the Independents. His published sermons have had very extensive circulation, and many a congregation throughout the kingdom has often listened to Jay's sermons without knowing to whom they were primarily indebted for the instruction they were receiving. That which made his pulpit addresses so useful also in the family, and so well adapted for reproduction in other pulpits, was their simplicity of style, combined with a clear and methodical statement of the lessons sought to be conveyed. The effect of his own ministrations was much enhanced by his earnestness of manner, and by a full command of his excellent vocal powers. Mr. Jay's regular congregation was large, and visitors to Bath usually repaired to his chapel to hear him preach. He generally made an annual visit to London and to the coast, and in the metropolis and elsewhere he attracted crowded congregations. When he had completed fifty years of his ministerial labours his people held jubilee services, in connection with which, at a public breakfast in the Assembly Rooms on the 2nd of February 1841, a handsome piece of plate and a purse containing 650*l.* were presented to Mr. Jay. Besides his sermons, of which several editions have been published, Mr. Jay wrote an 'Essay on Marriage;' 'Memoirs of the Rev. Cornelius Winter;' 'Memoirs of the Rev. John Clark;' 'Lectures on Female Scripture Characters' (published since his death); and an 'Autobiography,' from which and other sources a memoir of Mr. Jay was prepared by the Rev. Dr. Redford and the Rev. J. A. James, and published in 1854. A uniform edition of Mr. Jay's works was published under the author's superintendence in 1845-49 in twelve volumes, post octavo.

JAYADEVA, a celebrated Hindu poet. We possess hardly any particulars respecting the circumstances of his life. It appears from a passage in his poems that he was born at Kenduli, but the position of this town is very doubtful. Some commentators place it in Kalinga, others in Burdwan; but according to the popular tradition of the Vaishnavas, it was situate near the Gangea. (Wilson, in 'As. Res.' xvi. 52.) If the verse at the end of the 'Gita Govinda' is genuine, the name of Jayadeva's father was Bhojadeva, and that of his mother Râmâdevi. According to Sir William Jones, Jayadeva lived before Calidâsa ('As. Res.' iii. 183); but this is exceedingly improbable, both from the artificial construction of the verse and the whole tenor of the poem. Professor Wilson places Jayadeva in the 15th century of the Christian era ('As. Res.' xvi. 37); but Lassen, with greater probability, supposes that he lived in the middle of the 12th century. ('Prolegomena' to the 'Gita Govinda,' pp. iv. v.)

The only poem by Jayadeva which is extant is entitled 'Gita Govinda,' that is, 'the poem in honour of Govinda,' one of the names of Krishna, the eighth 'avatar,' or incarnation, of Vishnu. The poem is a kind of pastoral drama, in which the loves of Krishna and Râdha are described in a glowing and voluptuous manner. This poem has always been greatly admired among the Hindoos; and the majority of Hindoo commentators contend that it is not to be understood in a literal, but in a figurative and allegorical sense, and that the loves of Krishna and Râdha describe the "reciprocal attraction between the divine goodness and the human soul." Among the Europeans, Sir William Jones and Colebrooke admit this allegorical mode of interpretation ('As. Res.' 183; x. 419); but we are inclined to believe that the 'Gita Govinda,' like the poems of Hafiz, is in reality what it professes to be, merely an amatory poem; and that the allegorical mode of interpretation is the invention of commentators and scholiasts. The question has been very ably discussed by Lassen in his 'Prolegomena.'

An English translation of the 'Gita Govinda' was published by Sir William Jones in the third volume of the 'Asiatic Researches.' The original text was printed very inaccurately at Calcutta in 1808. A

new and very accurate edition, with notes and a Latin translation, edited by Lassen, was published at Bonn, 1836.

JEAN I., a posthumous son of Louis X. (Hutin), was born in 1316, and lived only eight days, but is numbered in the chronological order of kings. At his death his uncle and regent Philippe le Long assumed the title of Philippe V.

JEAN II., son of Philippe de Valois and of Jeanne of Burgundy, ascended the throne upon his father's death in 1350. At the beginning of his reign he caused Raoul, high constable of France, to be beheaded without trial, on a suspicion of treason, and he afterwards invited King Charles of Navarre, with whom he had some differences, to an interview at Rouen, and there arrested him and put to death several lords of his suite. The brother of the King of Navarre and the relatives of the murdered lords applied to Edward III. of England for assistance. In 1355, Edward sent his son the Black Prince into France at the head of an army. After ravaging several provinces the Black Prince was met by King Jean near Poitiers, who with 80,000 men attacked the English, 10,000 in number, on the 19th of September 1356: the French were completely defeated, and Jean, after displaying much personal bravery and being wounded, was taken prisoner and conducted to London, where he was received by King Edward with great honour. Negotiations followed: Edward offered to renounce his assumed claim to the French crown on condition of being acknowledged as absolute sovereign of Normandy, Guienne, Calais, and other lands which had been held in fief by the former kings of England. Jean wanted to gain time, but meanwhile his own country fell into a state of horrible anarchy. The citizens of Paris revolted against the Dauphin Charles, and drove him out of Paris, and soon after the peasants or serfs, so long oppressed and brutalised by the feudal nobility, broke out into insurrection, plundered and burnt the castles of the nobles, and massacred all within them, men, women, and children, with circumstances of frightful atrocity. This servile war, called *La Jacquerie*, from Jacques Bonhomme, the nickname given in derision to the French peasantry, lasted during the years 1357 and 1358, until the Dauphin and other great lords, having collected their forces, fell upon the peasants and massacred them by thousands, without giving any quarter. In May 1360, peace was concluded at Bretigny between France and England, Edward giving up his claims to Normandy and France, and assuming the title of sovereign Lord of Aquitaine, with the consent of the Dauphin, who promised to pay a large ransom for his father. Jean was then restored to liberty, but he found so great an opposition among his nobles to the fulfilment of the conditions of the treaty, and was perhaps also made so uncomfortable by the confusion and wretchedness which prevailed in France, that he resolved, to the great astonishment of his courtiers, to return to England, to confer with Edward upon what was to be done. On arriving in London he took up his old quarters in the Savoy, and was received in the most friendly manner by Edward. He soon after fell dangerously ill, and died in London, in April, 1364. He was succeeded in France by his son Charles V.

JEFFERSON, THOMAS, was born April 2, 1743, at Shadwell, now in the county of Albemarle, in Virginia. He was educated at the college of William and Mary, at Williamsburg, then the capital of the colony, where, under Dr. Small, a native of Scotland, who was professor of mathematics in the college, he studied mathematics, ethics, and other branches of knowledge, and in addition to his general acquirements, he made himself well acquainted with the best Greek and Latin writers, and to the end of his long life retained his ability to read them. Mr. Jefferson studied law under Mr. Wythe, then a lawyer of eminence. He made his first appearance at the bar of the General Court in 1767, at the age of twenty-four, about two years after the misunderstanding between Great Britain and the colonies had commenced. He practised for seven or eight years in the General Court, and was gradually rising to the first rank as an accurate and able lawyer, when he was called away to more important duties by the political events that preceded the American Revolution. In 1769 he was elected a member of the House of Burgesses for the county of Albemarle. In the session of this spring the house unanimously came to resolutions in opposition to those which had been lately passed in England by both houses of parliament on the affairs of Massachusetts. This measure, which was accompanied with the declaration that the right of laying taxes in Virginia was exclusively vested in its own legislature, and others of a like tendency, induced the governor, Lord Botetourt, abruptly to dissolve the assembly. The next day the members met at the Raleigh Tavern, and entered into articles of agreement, drawn up by Washington, by which they bound themselves not to import or purchase certain specified kinds of British merchandise, till the Act of parliament for raising a revenue in America was repealed; and they recommended this agreement to be adopted by their constituents. Eighty-eight members signed the agreement, among whom were George Washington, Thomas Jefferson, Patrick Henry, and others, who afterwards took a distinguished part in public affairs.

In 1773, on the meeting of the Virginia Assembly in the spring, Mr. Jefferson was an active member in organising the Standing Committee of Correspondence and Inquiry, the main objects of which were to procure early intelligence of the proceedings of the British Parliament, and to maintain a constant communication among all the colonies. On the dissolution of the assembly, in May 1774, by the governor, Lord

Dunmore, eighty-nine members met at the Raleigh Tavern, and, among other things, recommended the Committee of Correspondence to communicate with the committees in the other colonies "on the expediency of appointing deputies for the several colonies of British America, to meet in general congress, at such place annually as should be thought most convenient," to consult on their common interests. It was also forthwith agreed that the members who might be elected under the writs at that time issuing in the colony of Virginia should meet in convention at Williamsburg on the 1st of August following, in order to appoint delegates to the congress, if such general congress should be approved by the other colonies. The Convention did meet, and thus formed the first popular assembly in Virginia uncontrolled by governor or council. Mr. Jefferson, who was one of the deputies, prepared instructions for the delegates who might be sent to the congress. Being prevented by illness from attending on this occasion, his instructions were laid on the table for perusal, and were generally approved, but thought too bold in the existing state of affairs. Still the convention printed them, in the form of a pamphlet, under the title of 'A Summary View of the Rights of British America.' The convention drew up another set of instructions, which, though not so strong as Mr. Jefferson's, expressed with great clearness the points at issue between the colonies and the mother-country, and the grievances of which the colonies had to complain. The General Congress, consisting of fifty-five members, met at Philadelphia, September 4, 1774. The disputes which had broken out between Lord Dunmore and the Assembly of Virginia were continually increased by fresh causes of mutual irritation; and the governor at last thought it necessary to remove himself and his family into a British ship of war which was lying at York in York River.

On the 21st of June 1775 Mr. Jefferson took his seat in the General Congress as one of the delegates from Virginia, and was appointed one of a committee for preparing a declaration of the cause for taking up arms. A part of the address which he drew up was finally adopted, and no doubt greatly contributed to bring about the more decisive declaration of the following year. In 1776 Mr. Jefferson was again a delegate to Congress, and one of a committee appointed to draw up a declaration of independence. The committee was chosen in the usual way, by ballot, and as Mr. Jefferson had received the greatest number of votes, he was deputed by the other members to make the draught. Before it was shown to the committee a few verbal alterations were made in it by Dr. Franklin and Mr. (afterwards President) Adams. After being curtailed about one-third, and receiving some slight alterations in the part retained, it was agreed to by the House on the 4th of July, and signed by all the members present, except one. Before their adjournment, the Virginia Convention (July 5th) had elected Mr. Jefferson a delegate to Congress for another year; but he declined the honour on various grounds, among which was his desire to assist in reforming the laws of Virginia, under the new constitution, which had just been adopted. Congress also marked their sense of his services by appointing him joint envoy to France, with Dr. Franklin and Silas Deane; but domestic considerations induced him to decline this honour also.

From this time Mr. Jefferson's public life is interwoven with the history of his native state, and with that of the United States. During the war he took no part in military movements. He was governor of Virginia in part of 1779, 1780, and part of 1781, in which year the state suffered considerably from the incursions of Lord Cornwallis; and at the close of his period of office he narrowly escaped being taken prisoner by Colonel Tarleton in his own house at Monticello.

In May 1784 Mr. Jefferson was appointed by Congress minister to France, where he remained five years, during which he was actively employed in promoting the general interests of his country, and in keeping up an extensive correspondence. His industry and methodical habits enabled him to devote a great deal of his time to the examination of everything that could in any way prove beneficial to his countrymen. His correspondence during this period shows the variety of his pursuits, his unwearied industry, and his zeal for every improvement that could benefit the social condition of man. His remarks on the political troubles of France, of which he witnessed the beginning, are characterised by closeness of observation, and by sanguine anticipations of the benefit that would result from the people being called to participate in the exercise of the sovereign power.

He returned to America at the close of 1789, and early in the next year he was appointed secretary of state by the president, General Washington. He held this office till the end of 1793, when he resigned, and became the leader of the Republican party, or the party in opposition to the government of Washington. After awhile he went into retirement, and remained so till, in 1796, he was elected vice-president of the United States. In 1801 he was chosen president in place of Mr. Adams, by the House of Representatives, on whom the election devolved in consequence of the equal division of the electors' votes between Mr. Jefferson and Colonel Burr. He was elected a second time, and after fulfilling his term of eight years retired to his favourite residence at Monticello, near the centre of the state of Virginia. On Mr. Jefferson's retirement from the presidency of the United States he received, in the form of a farewell address, the thanks of the General Assembly of his native state, February 9th, 1809.

In this document, among the advantages for which the nation

is declared to be indebted to Mr. Jefferson's administration, the acquisition of Louisiana, and with it the free navigation of the Mississippi, are not forgotten. Mr. Jefferson early saw the importance of the United States possessing this great outlet for the commerce of the western states, and strongly urged it while he was secretary of state under General Washington. The object was accomplished in 1803, when Louisiana was purchased from the French for 15,000,000 dollars.

Mr. Jefferson himself thought that the most important service which he ever rendered to his country was his opposition to the federal party during the presidency of Mr. Adams, while he was himself vice-president of the United States. Himself in the Senate and Mr. Gallatin in the House of Representatives had alone to sustain the brunt of the battle, and to keep the republican party together. The reaction that ensued drove Mr. Adams from his office, and placed Mr. Jefferson there. Mr. Jefferson's administration was characterized by a zealous and unwearied activity in the promotion of all those measures which he believed to be for the general welfare. He never allowed considerations of relationship or friendship to bias him in the selection of proper persons for offices; he always found, as he says, that there were better men for every place than any of his own connexions.

The last years of his life, though spent in retirement, were not wasted in inactivity. He continued his habits of early rising and constant occupation; he maintained a very extensive correspondence with all parts of the world; received at his table a great number of visitors, and was actively engaged in the foundation and direction of the University of Virginia, which was established mainly in consequence of his persevering exertions, by the state of Virginia near the village of Charlottesville, a few miles from Monticello.

Mr. Jefferson died July 4th 1826, the day of the celebration, just half a century after that on which the Declaration of Independence was signed. Mr. Adams died on the same day. Mr. Jefferson is buried in the grounds near his own house. A simple inscription, which was found among his papers after his death, recording him as the author of the Declaration of American Independence, of the Statute of Virginia for Religious Freedom, and Father of the University of Virginia, is placed on his tomb. The fact of his having been president of the United States is not mentioned.

The latter days of Mr. Jefferson were embittered by pecuniary difficulties, which were owing in some measure to the neglect of his estates during his long absence on the public service; and in a great degree to an obligation which he incurred to pay a friend's debts.

In the 4th vol. of his *Memoirs, &c.*, p. 439, are printed his 'Thoughts on Lotteries,' which were written at the time when he was making his application to the legislature of Virginia for permission to sell his property by lottery, in order to pay his debts and make some provision for his family. The general arguments in defence of lotteries are characterized by Mr. Jefferson's usual felicity of expression and ingenuity, and they are also in like manner pervaded by the fallacies which are involved in many, if not all, of his political and moral speculations. But this paper has merits which entitle it to particular attention. It contains a brief recapitulation of his services; and is in fact the epitome of the life of a man who for sixty years was actively employed for his country. "I came," he says, "of age in 1764, and was soon put into the nomination of justices of the county in which I live, and at the first election following I became one of its representatives in the legislature; I was thence sent to the old Congress; then employed two years with Mr. Pendleton and Wythe on the revival and reduction to a single code of the whole body of the British Statutes, the acts of our Assembly, and certain parts of the common law; then elected governor; next to the legislature, and to Congress again; sent to Europe as minister plenipotentiary; appointed secretary of state to the new government; elected vice-president and president; and lastly, a visitor and rector of the university of Virginia. In these different offices, with scarcely any interval between them, I have been in the public service now sixty-one years, and during the far greater part of that time in foreign countries or in other states."

This is the outline of Mr. Jefferson's public life; to fill it up would be to write the history of the United States, from the troubles which preceded the Declaration of Independence to Mr. Jefferson's retirement from the presidency in 1809.

The paper from which we have already made one extract presents us with his services in another point of view, still more interesting. It is an epitome of those great measures which were due mainly or entirely to his firm resolution, unwearied industry, and singleness of mind, in his pursuit of objects which he believed essential to the stability and happiness of his country.

"If legislative services are worth mentioning, and the stamp of liberality and equality, which was necessary to be impressed on our laws in the first crisis of our birth as a nation, was of any value, they will find that the leading and most important laws of that day were prepared by myself, and carried chiefly by my efforts; supported, indeed by able and faithful coadjutors from the ranks of the House, very effective as seconds, but who would not have taken the field as leaders.

"The prohibition of the further importation of slaves was the first of these measures in time.

"This was followed by the abolition of entails, which broke up the hereditary and high-handed aristocracy, which, by accumulating immense masses of property in single lines of families, had divided our country into two distinct orders of nobles and plebeians. But further to complete the equality among our citizens, so essential to the maintenance of republican government, it was necessary to abolish the principle of primogeniture. I drew the law of descents, giving equal inheritance to sons and daughters, which made a part of the revised code.

"The attack on the establishment of a dominant religion was first made by myself. It could be carried at first only by a suspension of salaries for one year, by battling it again at the next session for another year, and so from year to year, until the public mind was ripened for the bill for establishing religious freedom, which I had prepared for the revised code also. This was at length established permanently, and by the efforts of Mr. Madison, being myself in Europe at the time that work was brought forward.

"To these particular services I think I might add the establishment of our university, as principally my work, acknowledging at the same time, as I do, the great assistance received from my able colleagues of the vocation."

When Mr. Jefferson was a member of the colonial legislature, he made an effort for the emancipation of slaves; but all proposals of that kind, as well as for stopping the importation of slaves, were discouraged during the colonial government. The importation of slaves into Virginia, whether by sea or land, was stopped in 1778, in the third year of the Commonwealth, by a bill brought in by Mr. Jefferson, which passed without opposition, and, as Mr. Jefferson observes, "stopped the increase of the evil by importation, leaving to future efforts its final eradication." The Act for the Abolition of Entails was not carried without some opposition, and that for the abolition of the Established Anglican Church was not finally carried till 1786, though before the Revolution the majority, or at least a large number of the people had become dissenters from the church.

Mr. Jefferson married, in 1772, Martha Skelton, the widow of Bathurst Skelton. She died ten years after their marriage. One daughter, and a numerous family of grand-children and great-grand-children survived him.

He was the author of 'Notes on Virginia,' which have been several times printed; but his reputation as a writer rests on his official papers and correspondence. "As an author," as his biographer remarks, "he has left no memorial that is worthy of his genius; for the public papers drawn by him are admired rather for the patriotic spirit which dictated them than for the intellectual power which they exhibit. They presented no occasion for novelty of thought or argument, or diction. His purpose was only to make a judicious and felicitous use of that which everybody knew and would assent to; and this object he has eminently fulfilled." Much has been said and conjectured as to the religious opinions of Mr. Jefferson, and his supposed infidelity has been the ground of much bitter attack on his character. In the latter part of his life he used to call himself a Unitarian when questioned on the subject by any of his friends. Perhaps his published correspondence presents the best means of judging of his religious opinions. Though approving of the morality which the Gospel inculcates, he speaks, to say the least, disrespectfully of the founder of Christianity, and contemptuously of his apostles and immediate followers.

(Tucker, *Life of Jefferson*, 2 vols., London, 1837; Jefferson, *Memoirs, Correspondence, &c.*, London, 1829.)

JEFFREY, FRANCIS, was born in Edinburgh, on the 23rd or October 1773, in the upper part of a house now marked No. 7, Charles-street, George-square. His father, George Jeffrey, was one of the deputy clerks of the Court of Session; his mother, Henrietta Loudoun, was the daughter of a Lanarkshire farmer. They had a rather numerous family, Francis being the eldest son, though not the eldest child. In the year 1781 he was sent to the High School of Edinburgh, where he was for four years under the care of one of the under-masters, Mr. Luke Fraser—a worthy man, whose celebrity depends on his having, in three successive classes, three pupils no less famous than Walter Scott, Jeffrey, and Brougham. Jeffrey's class-fellows, while he was under Mr. Fraser, used afterwards to remember him as "a little, clever, anxious boy, always near the top of his class, and who never lost a place without shedding tears." From Fraser's class, he passed, in regular course, in the year 1785 to that of the rector, Dr. Adam, the author of the 'Roman Antiquities,' and noted alike for his scholarship and the simple integrity of his character. Jeffrey, as well as Scott, used afterwards to speak with the highest respect of this good old man. It was in the winter of 1786-87, while still attending Dr. Adam's class, that Jeffrey, then a boy in his fourteenth year, saw the poet Burns. He was walking along the High-street, when he was attracted by the appearance of a man on the pavement, who, from his dress and manner, seemed to be from the country, but in whose looks otherwise there was something uncommon. It was Burns, then on his first visit to Edinburgh; and as "the little black fellow" was gazing at him, some one standing at a shop-door near said to him "Ay, laddie, you may weel look at that man; that's

Robert Burns!" Jeffrey never saw Burns again; but he used to dwell with pleasure on the incident.

In the winter of 1787, Jeffrey (his mother being then just dead) was sent to the University of Glasgow; his father for some reason or other preferring that university to the University of Edinburgh. Here he attended the Greek classes under Young, the logic class under Jardine (then recently appointed, but already with something of that reputation as a teacher which he afterwards maintained and increased), and the moral philosophy class, then taught by a Professor Arthur, the successor of the philosopher Reid. That he did not also attend the law class, then taught by the able and speculative Millar, is accounted for by the fact that his father, who was a strict and rather gloomy man, was a bigoted Tory, and likely to regard the teaching of a Whig like Millar with suspicion. Jeffrey's class-fellows at Glasgow remembered him afterwards as being there one of the cleverest of the younger students, somewhat "petulant" in his manners, and conspicuous for a little black moustache which he persisted in wearing on his upper lip in spite of remonstrance and ridicule. It was in the debating societies of the college however that he first broke on his companions of that day in the full display of his superiority. He was even then a fluent and rapid speaker, a ready and ingenious writer, and a merciless critic of the essays and opinions of others. It was at this time also that he commenced the habit of serious and versatile reading, and of note-taking and essay-writing for the purposes of private culture. This habit he kept up assiduously after his removal from Glasgow back to Edinburgh in the year 1789. In his little room in his father's house in the Lawnmarket, he read and wrote continually, filling quires of manuscript with notes and abstracts from books and miscellaneous dissertations of his own. His biographer Lord Cockburn gives a list of 31 different manuscript essays on literary and metaphysical topics, all written by him between November 1789 and March 1790. About the same time he attended the Scotch law and the civil law classes in the University of Edinburgh. In 1791 he went to Queen's College, Oxford, intending to complete his studies there. While at Oxford he was very solitary and melancholy; he disliked the place; and after nine months was overjoyed to leave it. "Except praying and drinking," he wrote to a friend during his stay at Oxford, "I see nothing that it is possible to acquire in this place." On his return to Edinburgh in July 1792, his friends found that his stay at Oxford had altered him in at least one thing: he now no longer spoke in his former natural Scotch accent, but in a sharp, and, as some thought it, an affected English style of pronunciation. "Jeffrey," Lord Holland used afterwards to say, "had lost his broad Scotch at Oxford, but he had gained only the narrow English." Very soon however his friends, who knew his real intellectual force and the genial goodness of his heart, became reconciled to his new style of speech; and Lord Cockburn certifies that to his latest years, Jeffrey had never really forgotten his native Doric, but could talk broad Scotch, and mimic even the provincial dialects of his countrymen when he chose. He had a strong relish, too, for Scottish anecdotes and humours. For a while after his return from Oxford, it seemed uncertain whether he might not be called upon by his father to give up the law and become a merchant; but the legal profession was at last definitely resolved on. In 1792-93 he again attended the law classes of Edinburgh University under Professors Hume and Wyld, as also the class of history under Alexander Tytler. Strange to say, he did not attend Dugald Stewart—Stewart's Whiggism being an objection in his father's eyes. On the 12th of December 1792, he became a member of the famous Speculative Society, then at the height of its fame; and here he first formed the acquaintance of Scott and many other young men of the Edinburgh set, who afterwards rose to distinction as lawyers, literary men, and statesmen. For several years Jeffrey was one of the ornaments of this society, reading essays in his turn, and figuring with peculiar éclat in almost every debate. Indeed, it used afterwards to be said of Jeffrey, as well as of Horner and Brougham, that never in their most glorious days did they speak better than they did when young members of the Speculative. Already in these debates, Jeffrey, despite the Toryism of his father, was a Whig of the keenest and most pronounced order. Meanwhile he continued his habits of various, though desultory reading, and of incessant composition in private on all sorts of subjects. He had even a dream at this time that he was born to be a poet; and he wrote, his biographer tells us, a great quantity of verse. Of this verse, Lord Cockburn says, from inspection, that though "viewed as mere literary practice it is rather respectable," it could never have been accepted as poetry. He adds that in one constitutional quality of the poet, Jeffrey was certainly highly endowed—the love of external nature and the delight in beautiful scenery. On the 16th of December 1794, Jeffrey was called to the Scottish Bar. It was the time when Scotland was politically stagnant under the so-called Dundas reign; when the whole country was managed by corruption and patronage; when such a thing as the free expression of political opinion by meetings or through the press was unknown; when three-fourths of the entire million and a half who then constituted the population of Scotland were Tories, at the absolute bidding of Dundas; and when such few leading Whigs as there were in Scotland were chiefly to be found in Edinburgh, where they were watched and laid under a kind of social ban. Of these Whigs the most zealous were lawyers, bold enough to avow their principles even at the expense of

the hostility of the Bench, and the loss of all hope of preferment. The party however was increasing; and year after year young lawyers of talent were attaching themselves to it. Among these young Whig lawyers, beating their heels idly in the Parliament House with no chance of briefs, and amusing themselves by social meetings at each other's lodgings and by essays and debates in the Speculative, Jeffrey was confessedly one of the chief, if not the chief. His prospects of practice were so small that for a time he had ample leisure for reading and literature. He began to contribute to the 'Monthly Review' and other periodicals; and for a time contemplated the pursuit of literature professionally. In 1800-1 he attended Dugald Stewart's lectures on political economy. At last, in November 1801, his talents as a pleader had procured him an income verging upon 100*l.* a year; and on this, with what other resources he had, he ventured to marry his second cousin, Catherine Wilson, of St. Andrewa. The young couple took up their residence in a modestly furnished third story of the house No. 13, Buccleugh-place; and it was here, at a convivial meeting of Jeffrey, Sidney Smith, Horner, and Brougham, that the 'Edinburgh Review' was projected. Smith was the originator of the idea, but the others immediately concurred, and Constable, a rising bookseller, became the publisher. The first number of the new journal saw the light on the 10th of October 1802; that number and two more were edited by Smith; but, on Smith's return to London, the entire management devolved on Jeffrey.

The great fact in Jeffrey's life, and that which makes his name memorable in the literary history of Britain, is that, for a period of twenty-six years (1803-1829) he was the editor of, and one of the principal contributors to, the 'Edinburgh Review.' With the history of that journal, his career is identified, and it became what it was under his hands. To use Jeffrey's own phrase, it stood on two legs—the one leg being the criticism of current literature; the other being Whig politics. Both as a literary critic and as a politician, Jeffrey was the soul of the 'Review.' To enumerate his articles in both capacities; to estimate the vast influence exerted by the 'Review,' during his management, on the contemporary literature and contemporary politics of Britain; to revive the numerous controversies both literary and political, in which the 'Review' was engaged; or to reconsider the right and the wrong of its literary judgments, in particular, on the distinguished poets of the period, such as Scott, Byron, Southey, Coleridge, Wordsworth, &c., is here unnecessary. All this belongs to the well-known literary history of the first quarter of the present century. Suffice it to say that Jeffrey's honesty in the expression of his opinions was never doubted; and that, where he was wrong, it was because his judgments, though honestly given, were limited by the essential nature of his own intellect. As a literary critic, he proceeded on what has been called "the beauty and blemish" principle of reviewing; that is, it was his regular habit first to state in clear, sharp, opinionative language what he considered the "beauties" of a poem or other work, and then, as a necessary drawback, to append a list of the "blemishes." And, although, in following this method, he undoubtedly remained constitutionally insensible to the higher poetry of Wordsworth and his kindred associates, he unquestionably exercised a healthy influence on the many by his chastisements. Where he praised, he praised heartily; and it is to his credit that, if his negative judgments have not been always ratified, his favourable decisions generally have. In politics there is now less question as to the value of his influence in promoting what was on the whole good and useful. He was uniformly on the side of progress and improvement; and, though he never was a Democrat, nor what would now be termed a Radical, but only a moderate Whig, his fighting, in his earlier days, was uniformly uphill. It is significant of the adaptation of his writings, both literary and political, to the purposes of rapid immediate effect, that, when a selection of his essays from the 'Edinburgh Review' was published in four volumes in 1843, the work did not take such rank in our permanent literature as has been accorded to the similar collections of the essays of Macaulay, Sidney Smith, Carlyle, and others.

To return to Jeffrey's life, apart from the 'Review,' his professional practice rapidly increased, as his powers as a lawyer found opportunities of displaying themselves. In some respects he was without a rival at the Scottish bar—combining good knowledge of law with singular perspicuity and ingenuity, and a rapid, fluent, and brilliant style of eloquence. As a speaker he was so rapid that once, at Glasgow, the defendant in a libel case, where he was conducting the prosecution, after listening to his torrent of words, declared that, by calculation with his watch, "that man had actually spoken the English language twice over in three hours." Jeffrey's triumphs as a pleader, both in criminal and civil cases, were numerous; but nowhere was he more successful, or more in his element, than at the bar of the General Assembly of the Scottish Church, at its annual meetings in May, when he was usually retained in important ecclesiastical cases. With his gradual increase of practice his wealth increased correspondingly, till at last he was in the receipt of a handsome annual income. But his wife did not live to share the full flush either of his fame or his fortune; she died in 1805; and it was while he was on a visit to London in 1806, to distract his mind from this calamity, that the famous 'leadless' duel between Jeffrey and Moore took place at Chalk Farm—occasioned by Jeffrey's notice of Moore's early poetry, and

immortalised by Byron's reference to it in his 'English Bards and Scotch Reviewers.' Byron, Moore, and Jeffrey were all afterwards the best of friends; and both the duel and the satire were laughed over among them. With Scott also, notwithstanding that their original political differences were somewhat intensified by Scott's secession from the 'Edinburgh Review' to aid in founding the 'Quarterly' in 1809, Jeffrey always remained on terms of personal friendship; and nowhere were Scott's novels more cordially welcomed and praised than in the 'Edinburgh.' At length, after remaining a widower eight years, Jeffrey married again. His second wife was an American lady, Miss Charlotte Wilkes, the daughter of Mr. Charles Wilkes of New York, and the grand-niece of Wilkes the notorious politician. He had met this lady during a visit of her family to Britain; and, in order to marry her, he undertook a voyage to America in 1813. During his brief stay in America, he saw some of the most important men in the United States, and formed an acquaintance with American society and American institutions. After his return, he and his wife resided for some time in the new town of Edinburgh; but ultimately he removed to Craigerook, a beautiful little property at the foot of the Corstorphine Hills, about two miles from Edinburgh, the old tarretted mansion of which, and the wooded grounds, were much improved by him in subsequent years. The vicinity of the place to Edinburgh made it perfectly convenient for his professional engagements; and till the time of his death he here received as his guests his professional and other friends, and all strangers of distinction who visited Edinburgh. The elegant hospitalities of Craigerook were proverbial; and the house and grounds retain their associations with Jeffrey, as Abbotsford is associated with the name of Scott. Here Moore sang his songs under the roof of his former adversary; and here, in later days, Dickens formed that acquaintance with the venerable critic which ripened into so strong a friendship.

In the year 1821, Jeffrey was elected Lord Rector of the University of Glasgow. Whig politics were by this time in the ascendant in Scotland; and Jeffrey, as the Whig leader, took his part in the public meetings and other demonstrations which heralded the approach of the era of Reform. Having been chosen Dean of the Faculty of Advocates in 1829, he deemed this office incompatible with the editorship of the 'Review,' which accordingly he resigned into the hands of Mr. Napier. He still took an interest in the 'Review' however; and at a considerably later period, when his son-in-law, Mr. Empson, succeeded Mr. Napier as editor, it was his delight to revise proofs and correct articles, as his son-in-law's deputy. In the meantime however he had passed through new phases of his life. In 1830 he was elected a member of the first parliament of William IV., being returned for the Perth, Forfar, and Dundee district of burghs. In March 1831 he was unseated on petition, but was immediately returned again by Earl Fitzwilliam for the borough of Malton. He represented this borough till 1832, taking part in the Reform debates; and in the end of that year he was returned to the first reformed parliament for the city of Edinburgh, along with Mr. Abercromby, the speaker (now Lord Dunfermline). He remained in parliament till 1834, and was Lord Advocate of Scotland under the Grey government. His parliamentary success however did not answer the expectations that had been formed from his fame as a critic and a forensic orator; and he seems himself to have welcomed the change when, in 1834, he was raised to a vacant judgeship on the Scottish bench, and so relieved from the cares of parliament. Scottish judges have the courtesy-title of 'Lord;' and hence Jeffrey was thereafter distinguished as Lord Jeffrey, though still legally only Francis Jeffrey, Esq. As a judge, he had a very high reputation for soundness, conscientiousness, and rapidity. He was noted for a habit of interrupting pleaders when they wandered, so as to bring them back to the point; and so long as he was in the second division more business was sent before him than before any other judge. He continued in the discharge of his duty almost to the last, dying in his seventy-seventh year, after a short illness, at Craigerook, on the 26th of January 1850. In the relations of private life, Lord Jeffrey was a singularly affectionate and amiable man, soft-hearted to a degree which surprised those who, till they saw him, had figured him only as a sharp and severe critic. A very genial impression of him in this respect is to be gathered from the selections from his correspondence published by his friend Lord Cockburn, as an appendix to his Biography, in 1852.

JEHOAHAZ, the elder, was the son of Jehu, and succeeded his father on the throne of Israel in B.C. 867. He reigned seventeen years, with little credit to himself or advantage to his people; for he followed the idolatry of his father, and his country was ravaged by Hazael, king of Syria. He however repented of his sins, and was saved from utter ruin, though he was reduced so low as to have but "fifty horsemen, and ten chariots, and ten thousand footmen; for the King of Syria had destroyed them, and had made them like the dust by thrashing." His reign was prolonged however till B.C. 850, when he died, and was succeeded by Joash.

JEHOAHAZ, the younger, also called Shallum, was king of Judah, and the son of Josiah. After the death of his father in battle against Pharaoh-Necho, at Edræson, Jehoahaz, at the age of twenty-three, assumed the crown, to the prejudice of his elder brother, Eliakim. Necho, displeased with this assumption, "put him down in Jerusalem," fettered him, and sent him prisoner to Egypt, where

he died, having reigned only three months. He was succeeded by Jehoikim.

JEHOIAKIM, to which his name had been changed from Eliakim by Pharaoh-Necho as a mark of subjection, succeeded his brother in B.C. 608, and paid a hundred talents of silver and a talent of gold which Necho had demanded as a punishment on the country for having chosen Jehoahaz. Jehoikim was twenty-five when he began to reign, and pursued the idolatrous course of his predecessors, though solemnly warned by the prophet Jeremiah, whom he persecuted, and would have put to death, but that he had powerful protectors. In the first year of his reign Nebuchadnezzar had conquered the Egyptians, and Jehoikim had to transfer his allegiance to the Babylonians. In the fourth year Pharaoh-Necho again tried his fortune against Nebuchadnezzar, but was thoroughly beaten at Carchemish. Jehoikim, encouraged by the attempt of Necho, had withdrawn from his allegiance to the Babylonians, but on the defeat of the Egyptians found himself exposed and defenceless to the anger of Nebuchadnezzar. The conqueror besieged Jerusalem, and took it, but behaved with extreme moderation. He allowed Jehoikim to retain the throne, but plundered the temple of all its golden ornaments, which he removed to Babylon, together with certain persons as hostages, among whom was the future prophet Daniel. This is usually taken as the commencement of the seventy years of Babylonian captivity. Jehoikim however continued his impious and tyrannical government, "filling Jerusalem with innocent blood," and slaying the prophet Urijah, who foretold the coming calamities of Judah and Jerusalem, and causing his body to be cast into the graves of the common people. Jehoikim reigned altogether eleven years, when, for some offence, Nebuchadnezzar again attacked him, and "bound him in fetters to carry him to Babylon;" but it is supposed that he died in Jerusalem before this could be carried into effect, and that, according to the prophecy of Jeremiah, he was "buried with the burial of an ass, drawn and cast forth beyond the gates of Jerusalem." He was succeeded by Jehoikim.

JEHOIAKIN, otherwise JECONIAH, was eighteen years of age when he succeeded his father in B.C. 597 (2 Kings, xxiv; in 2 Chron. xxxvi. it is said eight years old). He reigned three months and ten days, "and did that which was evil in the sight of the Lord." Jerusalem was again besieged and taken by Nebuchadnezzar, who carried him away prisoner to Babylon, with all the treasure from the temple and palace which he could collect, the princes and "men of valour," and all that "were strong and apt for war." Among these captives was Ezekiel, the future prophet. He then made Mattaniah, his brother, king of Judah, changing his name to Zedekiah, under whom Jerusalem was again taken, and the remainder of the nation carried into captivity. Jehoikim passed a long life in Babylon, and in the thirty-seventh year of his imprisonment Evil-merodach, then king of Babylon, released him from prison, and "set his throne above the throne of the kings that were with him in Babylon," with an allowance "for every day all the days of his life."

JEHORAM, or JORAM, king of Israel, was the son of Ahab, and succeeded his brother Ahaziah in B.C. 907. He continued the institutions of Jeroboam, but he destroyed the images of Baal and all the grosser idolatries. The Moabites, who had been tributary to Israel, revolted, and Jehoram sought the assistance of Jehoahaphat of Judah to subdue them. On advancing into the country the army was distressed for water, and the kings sought the advice and assistance of the prophet Elisha, who predicted a miraculous supply of water, and the defeat of the Moabites. This took place; the cities were beaten down, and the lands devastated. Shortly afterwards Israel was attacked by the Syrians, but the storm was diverted by the miraculous interposition of Elisha. Again the Syrians under Ben-hadad invaded Israel, and besieged Samaria, which suffered the most intense severities of famine, and was reduced to the most revolting extremities. A miracle, as foretold by Elisha, again saved them. A panic terror seized the host, who fled in the night, leaving abundance of provisions, their tents, horses, and everything, and "fled for their life." Jehoram seems to have felt some gratitude; he inquired as to "all the great things that Elisha had done;" and he restored her lands to the Shunamite woman who, believing Elisha's prophecy of the famine, had left the country, and was now returned. Elated with his success he allied himself with Ahaziah, king of Judah, to recover Ramoth-Gilead from the Syrians, whose sovereign now was Hazael, who had murdered his predecessor, as foretold by Elisha. Before this place Jehoram was wounded by an arrow, and withdrew to Jezreel with his nephew Ahaziah in order to be cured, leaving the siege to be conducted by Jehu. While recovering Jehu had been conspiring against him, and advanced to Jezreel with a large armed force. The two kings went to meet him, and, in the field of Naboth, Jehoram, discovering the hostile designs of Jehu, turned his chariot and fled, but was killed by an arrow shot by Jehu, and Ahaziah escaped with difficulty. Jehu thus attained the throne in 895 B.C.

JEHORAM, or JORAM, king of Judah, was the son of Jehoahaphat, and ascended the throne in the thirty-second year of his age in B.C. 904. He had been married in his twentieth year to Athaliah, the daughter of Ahab and Jezebel, and this union was productive of the most evil consequences. The first act of his reign was to put to death all his brethren, whom his father had well provided for; and

also divers of the princes of Israel. These murders were most probably committed in order to avoid their opposition to his next measure, the adoption of the grossest idolatry, and the compelling of his subjects to follow his example. A writing from Elijah (who had been previously translated) was produced to warn him of the evils which would follow from his courses, but in vain. The Edomites revolted, and permanently threw off their dependence on Judah; the Philistines, aided by the Arabians, invaded his kingdom, ravaged the country, plundered his palace, and carried off his wives and all his children but one; a plague was inflicted upon his people; and after a disgraceful reign of eight years, during the last two of which he was suffering from a painful and incurable disease, he died, and was succeeded by his son Ahaziah.

JEHOSHAPHAT, king of Judah, succeeded his father Asa in B.C. 929, when he was thirty-five years old. He was an able and pious prince, who governed his people well, maintained the worship of the true God, reformed abuses wherever they had crept in, ordered the laws to be impartially administered, and saw his people prosperous and contented. He constructed fortresses, possessed great military resources (the Scriptures state 1,160,000 men were enrolled as soldiers), and Edom, Philistia, and Arabia paid him tribute. He had "riches and honours in abundance," when, unfortunately for him, he was induced to enter into an alliance with Ahab of Israel, cementing the union by a marriage of his son with Ahab's daughter. Jehoshaphat's reasons for this alliance were probably the wish to strengthen the collective Jewish nation against its foreign neighbours, and to wean the Israelites from their idolatry; but he failed in both, having overlooked the extreme wickedness of his ally. To promote the first object he joined Ahab in an attack on Ramoth-Gilead, then in possession of the Syrians; but Ahab was slain, the army dispersed, and Jehoshaphat returned to Jerusalem to pursue his previous peaceful and honourable course of life. The disaster before Ramoth-Gilead appears to have encouraged the Moabites and Ammonites to rebel; but Jehoshaphat, after a solemn fast and prayer, was delivered from this danger by the enemies' host turning their arms against each other, so that when the Hebrew army approached them the wilderness was found covered with slain, and the soldiers were three days collecting the valuable spoil, which was more than could be taken away. Jehoshaphat made a solemn thanksgiving for this deliverance; but, though he had been warned by a prophet after his alliance with Ahab of the anger of the Lord for helping the ungodly, he yet continued his friendship to Ahaziah, in conjunction with whom he endeavoured to restore the traffic on the Red Sea. Ships were built at Ezion-Geber, at the head of the Eilat Gulf; but, as a prophet had foretold, they were wrecked soon after leaving the port. Ahaziah would have renewed the attempt, but Jehoshaphat refused. The next event of his reign was joining with Jehoram in an expedition against the Moabites, the success of which is to be ascribed to Jehoshaphat [JEHORAM]. Shortly after this he died, having reigned twenty-five years, and was succeeded by his son Jehoram.

JEHU was not of the royal family, but a commander in the army of Jehoram king of Israel, the son of Ahab and Jezebel. He was consecrated king by one of the prophets sent by Elisha in B.C. 895. Immediately on his consecration he was acknowledged by the captains of the army, and proceeded at once to attack Jehoram, who lay ill of the wounds received in battle against Hazael king of Syria. Jehu shot Jehoram with an arrow from his own bow, and ordered him to be cast into the field of Naboth. Jezebel was cast from an upper window and killed, the dogs devouring her as had been foretold. He also caused seventy of Ahab's children to be beheaded, and forty-two brothers of Ahaziah king of Judah, justifying himself by the command of Elisha. He also destroyed many of the worshippers of Baal, but though his zeal was ardent it was not consistent, for he adopted the religious policy of Jeroboam, in order probably to keep himself independent of Judah. In the latter days of Jehu the provinces beyond the Jordan were wrested from him by Hazael king of Syria, and he died in B.C. 856, in the twenty-eighth year of his reign. The name of Jehu occurs more than once on the monuments discovered by Mr. Layard at Nineveh, and on one in connection with that of Hazael; as Jehu the son of Omri (that is, of the house or family of Omri), the name is on an obelisk brought from Nineveh and now in the British Museum.

*JELLACHICH VON BUZIM, JOSEPH, FREIHERR (Baron), Ban of Croatia, was born October 16, 1801, at Peterwardein, in Austrian Slavonia. His father was a general in the Austrian service, who served in the wars of the French Revolution, and died in 1810. Jellachich was educated at Vienna, in the military academy called the Theresium, and in 1819 entered the Austrian army as a sub-lieutenant. In 1825 he was a lieutenant in the 3rd Dragoon regiment, and circulated a volume of poems among his friends and fellow-officers. In 1830 he was appointed to the command of one of the frontier regiments of Hulans, with which he served four years in Italy. In 1837 he became a major of infantry. He was afterwards appointed lieutenant-colonel in the 1st Banat frontier regiment, and in 1842 became the colonel. Some time after the French Revolution of March 1848, when the Hungarians had obtained the restitution of their parliament and other popular rights, the court of Vienna, finding its power diminished, secretly incited the Croats, Dalmatians,

and Servians, to make war on the Hungarians. The Croats sent a deputation to Vienna with the request that Jellachich might be appointed their Ban, or military commander-in-chief. The emperor granted their request, and the Ban Jellachich forthwith collected an army of about 40,000 men, partly irregulars, but well armed, well appointed, and with plenty of artillery and ammunition, and also reinforced by the addition of a considerable body of Austrian regular troops from Styria. With this army Jellachich crossed the Drave at Zegrad on the 9th of September 1848. Jellachich himself advanced with a corps of 15,000 men by Gross Kanisa along the southern shores of the Platten Lake to Siotok. A battle was fought on the 29th of September, and Jellachich was defeated. An armistice was granted at his request, which he employed in making good his retreat by night from Weissenburg to Raab. He thus transferred the line of his operations to the high-road to Vienna, leaving his rear-guard under General Roth in a situation which compelled him to surrender to the Hungarians. Jellachich having collected together the best of his troops, placed the whole, amounting to 18,000 men, at the disposal of Prince Windischgrätz, who was then besieging Vienna, which was in the possession of the insurrectionists. When the Hungarians were defeated at Swechat, near Vienna, the main body of the Austrian army was commanded by Jellachich. He served during the remainder of the Hungarian war under Haynau, who was commander-in-chief, but he did not on any occasion particularly distinguish himself. His poems were reprinted in 1851 in a handsome 8vo volume, with illustrations, for the benefit of the Jellachich Invalid-Fund at Vienna.

JENNER, EDWARD, M.D., was born in 1749, at Berkeley, in Gloucestershire, of which place his father was vicar. He was educated at Cirencester, and apprenticed to Mr. Ludlow, a surgeon at Sudbury. At the conclusion of his apprenticeship he went to London, and became a pupil of John Hunter, with whom he resided for two years while studying medicine at St. George's Hospital, and with whom his philosophical habits of mind and his love of natural history procured him an intimate and lasting friendship. In 1773 he returned to his native village, and practised as a surgeon and apothecary till 1792, when he determined to confine himself to medicine, and obtained the degree of M.D. at St. Andrews University.

But the history of Jenner's professional life is embodied in that of vaccination. While at Sudbury he was surprised one day at hearing a countrywoman say that she could not take the smallpox because she had had cowpox; and upon inquiry he learned that it was a popular notion in that district, that milkers who had been infected with a peculiar eruption which sometimes occurred on the udder of the cow were completely secure against the smallpox. The medical men of the district told him that the security which it gave was not perfect; they had long known the opinion, and it had been communicated to Sir George Baker, but he neglected it as a popular error. Jenner, during his pupilage, repeatedly mentioned the facts, which had from the first made a deep impression on him, to John Hunter, but even he disregarded them; and all to whom the subject was broached either slighted or ridiculed it. Jenner however still pursued it; he found, when in practice at Berkeley, that there were some persons to whom it was impossible to give smallpox by inoculation, and that all these had had cowpox; but that there were others who had had cowpox, and who yet received smallpox. This, after much labour, led him to the discovery that the cow was subject to a variety of eruptions, of which one only had the power of guarding from smallpox, and that this (which he called the true cowpox) could be effectually communicated to the milkers at only one period of its course.

It was about 1780 that the idea first struck him that it might be possible to propagate the cowpox, and with it the security from smallpox, first from the cow to the human body, and thence from one person to another. In 1788 he carried a drawing of the casual disease, as seen on the hands of milkers, to London, and showed it to Hunter, Cline, and others; but still none would either assist or encourage him; scepticism or ridicule met him everywhere, and it was not till 1796 that he made the decisive experiment. On the 14th of May a boy, aged eight years, was vaccinated with matter taken from the hands of a milkmaid; he passed through the disorder in a satisfactory manner, and was inoculated for smallpox on the 1st of July following without the least effect. Jenner then entered on an extensive series of experiments of the same kind, and in 1798 published his first memoir, 'An Enquiry into the Causes and Effects of the Variolæ Vaccinæ.' It excited the greatest interest, for the evidence in it seemed conclusive; yet the practice met with opposition, as severe as it was unfair, and its success seemed uncertain till a year had passed, when upwards of seventy of the principal physicians and surgeons in London signed a declaration of their entire confidence in it. An attempt was then made to deprive Jenner of the merit of his discovery, but it signally failed, and scientific honours were bestowed upon him from all quarters. Nothing however could induce him to leave his native village, and all his correspondence shows that the purest benevolence, rather than ambition, had been the motive which actuated all his labours. "Shall I," he says in a letter to a friend, "who, even in the morning of my life, sought the lowly and sequestered paths of life, the valley and not the mountain—shall I, now my evening is fast approaching, hold myself up as an object for fortune and for fame?"

My fortune, with what flows in from my profession, is amply sufficient to gratify my wishes." Till the last day of his life, which terminated suddenly in 1823, he was occupied in the most anxious labours to diffuse the advantages of his discovery both at home and abroad; and he had the satisfaction of knowing that vaccination had even then shed its blessings over every civilised nation of the world, prolonging life, and preventing the ravages of the most terrible scourge to which the human race was subject.

Jenner's other works all evince the same patient and philosophical spirit which led him to his great discovery. The chief of them was a paper 'On the Natural History of the Cuckoo,' in which he first described that bird's habit of laying its eggs singly in the nests of smaller species, to whom it leaves the office of incubation and of rearing the young one, which, when a few days old, acquires the sole possession of the nest by the expulsion of its rightful occupants. Indeed he gained so much credit by this paper, that he was recommended not to send his account of vaccination to the same society, lest it should injure the scientific reputation which he had already obtained.

The life of Jenner has been written by his friend Dr. Baron of Gloucester, in 2 vols. 8vo. Five medals have been struck in his honour, of which three were produced in Germany, and a statue is erected to him in his native county. But it is remarkable that the only public testimonials awarded by his country to the man whose unaided intellect and industry have added more years to the lives of men than the united labours of any century, were grants of 10,000*l.* and 20,000*l.*, which were voted to him by the House of Commons in 1802 and 1807.

JENYNS, SOAME, born 1704, died 1787, enjoyed a considerable reputation in his lifetime from the happy accident of uniting good birth and fortune with a creditable share of literary accomplishment and success. His family property was at Bottisham, near Cambridge; he was educated at St. John's College; elected member of parliament for the county in 1741; for the borough of Dunwich in 1754; for the town of Cambridge in 1761, which last he represented until his withdrawal from public life. In 1755 he was made a lord of trade, and he held that office in spite of political changes until its abolition in 1780, being a steady supporter of all existing administrations. As a versifier he is elegant and sprightly; sometimes rather free. His poems, which consist of 'The Art of Dancing,' 1728, and 'Miscellanies,' 1770, have found admission into the second and third editions of Johnson's Poets. His prose works are—1. 'A free Inquiry into the Nature and Origin of Evil,' 1756. This unsatisfactory attempt to solve one of the most difficult of moral problems was very ably and severely criticised by Dr. Johnson in the 'Literary Magazine,' and this rebuke Jenyns seems never to have forgiven. (See Boswell's 'Life,' under the above year.) 2. 'View of the Internal Evidence of the Christian Religion,' 1776, for the divine origin of which he argues from its utter variance with the principles of human reason. This was a curious ground for a friend to take; and though the book obtained much praise, there were many also who regarded it as the work of a disguised enemy. This does not seem to have been the case; Jenyns, though once a sceptic, was in the latter part of his life a professed, and, as Boswell, who was no friend to him, believed, a sincere Christian. 3. Dissertations on various subjects, 1782. These are political and religious. His prose writings have obtained praise for elegance of style, art, shrewdness of remark, and aptness of illustration; but his talent was better suited for the lighter and more showy parts of literature than for metaphysics and controversial theology. He published some pieces not here mentioned. His works are collected in four vols. 8vo, 1790-93, with a Life by Mr. Cole.

* JERDAN, WILLIAM, was born at Kelso, in Roxburghshire, on April 16, 1782, a younger son of a small proprietor, who died in 1796. He was educated in one of the Scottish parochial schools, where he acquired some classical and mathematical knowledge, afterwards improved under the care of Dr. Rutherford, the author of the 'View of Ancient History.' It had been the wish of his family that he should study law at Edinburgh, but he desired to seek his fortune in London, and was therefore, in 1801, placed in the counting-house of a West India merchant, at a salary of 50*l.* a year. He proved an indifferent clerk, and in 1802 was removed to Edinburgh to study law. To law he appears to have paid as little attention as to commerce, and his time was passed in a sort of idle, though not discreditable, dissipation. He was fond of society, sought it, and was welcomed in it. It was found that the law would not answer, so he returned to London, with slender funds and no settled purpose; got into debt; was released by an uncle, a naval officer, who took him on board his ship at Portsmouth, where he was entered as surgeon's clerk. While here one of his effusions in verse was inserted in a Portsmouth paper; and this so elated him, that he borrowed money to repair again to London, to seek employment on a newspaper. This was in 1805, and he succeeded in getting an engagement on a newspaper newly started, called the 'Aurora'; and in a few years changed to the 'Pilot,' the 'Post,' the 'Press,' and the 'Sun,' of which last he was editor for many years; and he also wrote for several country newspapers, so that his time was fully occupied, while his employment procured him many new and influential acquaintances, both literary and political. Mr. Jerdan's best title to celebrity however, is the establishment of the 'Literary Gazette,'

the first successful attempt to popularise literature by means of well-considered criticism, and to impart intelligence of a superior description on the fine arts and science, issued at short intervals, and without any mixture of politics or polemics. It was commenced in January 1817; and that it still subsists is a proof that it was well adapted to the wants and tastes of the time, and that it was not inefficiently conducted. Mr. Jerdan had commenced in the 'Sun' the giving of literary reviews, as distinguished from short notices, and this probably gave the notion of the 'Literary Gazette' to Mr. Colburn, by whom it was commenced and published weekly, price one shilling. Mr. Jerdan began to contribute to it in the fifth number; and in July 1817 became its editor. In its early career many able contributors were secured, much interesting information disseminated, and the undertaking gradually prospered, and soon became a valuable property. Mr. Jerdan shortly after obtained a share, and ultimately became the sole proprietor. It is not necessary to trace its progress, nor to enumerate the misfortunes by which Mr. Jerdan lost considerable sums, and by which, in 1850, his connection with the 'Literary Gazette' was terminated. His services to literature were however recognised under the administration of the Earl of Aberdeen, when a pension of 100 guineas a year was granted to him from the pension-fund; and in 1851 a subscription of nearly 700*l.* was raised for him.

In his 'Autobiography,' published in 1852-53, Mr. Jerdan has many lamentations on his ill-reward for all his literary labours. In early life he had been the associate of the Pollocks, Wilde, and others, who rose to great eminence in their respective pursuits; and, as he thinks his talents were then at least equal to theirs, he wonders that he has not been equally successful, and advises no one to depend upon literature as a means of support. But he forgets that the men whose example he quotes did not overlook nor shun the necessary preliminary labour. Could any other profession have been adopted with success upon so slender a foundation as that upon which he ventured to London in 1805? The 'Autobiography,' from the number of eminent characters with whom its author came into contact, contains many interesting particulars, but displays very little of artistic arrangement, and much of questionable taste.

JEREMIAH, one of the prophets of Judah, the writer of the greater part of the book in the Hebrew canon which bears his name, and of the whole of the book, succeeding it in that canon, called 'The Lamentations.'

He was of the sacerdotal family, being the son of Hilkiah, a priest, whose residence was at Anathoth in the land of Benjamin, about three miles north from Jerusalem. This we learn from the general title to his book of Prophecies (chap. i., ver. 1), and that title sets distinctly before us the period through which he flourished. He was called to the prophetic office, being then in his youth, in the thirteenth year of King Josiah, which, according to the received chronology, was 629 years before the Christian era commenced. He continued in the prophetic office till the eleventh year of King Zedekiah, that is, till *a.c.* 588. Nearly all the prophecies collected in this book were delivered by him in those reigns, and in the intermediate reigns of Jehoahaz, Jehoiakim, and Jehoiachin, the unhappy family of Josiah. He consequently witnessed the death of Josiah, who was slain in battle by the king of Egypt, the deposition of Jehoahaz, and the two great invasions of the kingdom of Judah by Nebuchadnezzar, king of Babylon, who in the first carried away Jehoiachin and many of the people captive, and in the second carried away still more, with Zedekiah the king, whose eyes he caused to be put out when he had slain his sons and many of his nobles in his presence. Then it was that ensued the burning of the king's palace and of the temple which had been erected by Solomon, and of the whole city of Jerusalem, in that fatal fifth month and seventh day of the month which was long remembered in the calendar of Jewish calamities.

These things saw Jeremiah; and in the midst of all this scene of misery his voice was often raised, as one of the prophets of Jehovah, to deplore the calamities which fell upon his country, or with the voice of warning to call his countrymen to depart from the offences which had provoked those sufferings, and to turn themselves to God, both in outward observances and in inward purity and conformity of heart.

His contemporaries in the prophetic office were in the earlier periods Zephaniah and Habakkuk, and in the latter his era approaches near to that of Ezekiel and Daniel.

The book entitled his 'Prophecies' is a collection of such prophecies or exhortations as he delivered at various times, mingled with relations of historical events. The last chapter, the fifty-second, is wholly historical, and is supposed to have been written by some other person, not improbably Esra, and to be intended as a kind of introduction to the book of Lamentations which follows it. But the most remarkable circumstance relating to the composition of the book is this, that the various prophecies are put together without any regard to the order of time in which they were delivered. At the beginning indeed we have the account of his call to the prophetic office, but as we proceed we soon find that we have prophecies delivered in the reign of Jehoiakim following others which were delivered many years after in the reign of Zedekiah.

However, this does not lead to any serious inconvenience or occa-

sion any important difficulty, as we are generally informed in whose reign and at what time the several distinct prophecies were delivered. They are very easily distributed in the chronological order by any one who is desirous to do so, and thus to obtain a more distinct idea of the object of the prophet, and the relation of these compositions to the time at which he lived; and on this account we omit the chronological arrangement of the several prophecies, either as following Dr. Blayney, or the German critic Rosenmüller, or proposing any other of our own. Those who desire to read the Scriptures with understanding can have no more agreeable and profitable exercise than thus to refer the writings of the prophets to the period of Jewish history to which they belong, and to observe how suitable they are to the then state of the people of God, and to the character which the prophets sustained among them.

The tone in which Jeremiah addressed the people was frequently disapproved by the political authorities of the time. He appears to have been an ever-faithful witness to the Most High, and to have sought to support his honour as well in the good days of King Josiah as in the evil days of his degenerate sons. In the later reigns it was said that he dispirited the people, and that they were rendered by him less energetic in the resistance which they offered to the armies of Chaldaea. This led to his being placed under restraint and punished.

Hitherto our remarks have been confined to the first forty-two chapters and to the fifty-second, the last. But when we arrive at the forty-third chapter we find a new and very important circumstance in the life of Jeremiah. In neither the first nor the second captivity was Jeremiah carried away with his countrymen and king to Babylon: he still remained in Judaea, lamenting her fallen and desolate state, and exhorting and encouraging the remnant of the people to continue in the land till they should be forcibly expelled. This was distasteful to a powerful party, who thought they saw in Egypt a safe place of retreat from the power of the King of Babylon, and who finally led the people that remained into that country, carrying Jeremiah with them. They settled at a place called Taphanhes, which is probably the Daphnæ of the Greek geographers. The forty-fourth chapter is an exhortation which he delivered to his countrymen in Egypt. But in the forty-fifth chapter we are carried back to the times of King Jehoiakim; so little of order and regularity is there in the making up of this book. After this there follow various predictive discourses delivered by Jeremiah at various and uncertain periods concerning other nations, the Egyptians, Philistines, Moabites, Ammonites, Edomites, and others, ending with an awful denunciation against Babylon, in which the utter desolation of that great and flourishing city is predicted, and the return of the people from their long captivity. The prophecy of the utter abolition of Babylon, so that its site should become a place for the abode of wild beasts of the desert, is very remarkable.

The sacred books contain no later information concerning the prophet than that he was among those who went to Taphanhes. But some of the early Christian writers relate of him that he was stoned to death by his countrymen in Egypt for preaching against their idolatry.

Two very different accounts are given of the occasion on which he wrote the book of Lamentations. The old opinion, after Josephus, was that it was written on the death of King Josiah: but the later and more probable opinion is that it is a bewailing of the lost state of Judaea when it had suffered so dreadfully from the armies of Nebuchadnezzar. It is a very tender and pathetic poem, consisting of five portions, or, as they may be considered, distinct elegies. The structure is very artificial, the successive stanzas in each of the elegies beginning with the letters of the alphabet taken in order. Some of the Psalms are also in their structure of this form.

Some persons have imagined that they see in the style of Jeremiah proofs of original rusticity. There are not the dignity and splendour of Isaiah, but there are great beauties peculiar to this prophet, whose province appears rather to be the expression of grief and concern than of glowing indignation.

JEREMIE, SIR JOHN, was born in Guernsey, August 19th 1795, and was the eldest son of John Jeremie, a distinguished advocate of the Royal Court of that island. At an early age he was sent to the Blundell grammar school, Tiverton, but his studies were soon interrupted by the premature death of his father. Upon his return to Guernsey he devoted himself to the study of the law, which he completed during a residence at Dijon in France. As early as 1816, at the commencement of his public life, he distinguished himself before the royal commissioners, sent over to Guernsey to correct certain abuses in the laws and administration of justice in that island. He was afterwards retained in many difficult cases, both civil and criminal, and soon acquired a high character for independence and energetic zeal in the discharge of his professional duties. On more than one occasion he was chosen to plead cases of appeal before the Privy Council, where his talents and eloquence found a larger sphere for their action, and brought him before the notice of government.

In October 1824 he was appointed to the office of chief justice of St. Lucia in the West India. "At the time the tender of an appointment was made to him," he observes, in his 'Essays on Colonial Slavery,' "he was unacquainted with a single individual in the service

of the colonial department, and his political opinions were rather opposed to the then existing government. On the question of slavery he was thoroughly indifferent; indeed, it was so remote from his usual pursuits, that he may fairly say he had never given it a thought. In the interval between the first proposal and his accepting office his professional avocations brought him to England, and on this occasion, probably owing to this proposal, his curiosity prompted him to attend an anti-slavery meeting. The impression made upon his mind was rather unfavourable than otherwise to the abolitionists. He heard much declamation, much angry and eloquent declamation; but accustomed from early life to sift evidence, it struck him that there was a deficiency of facts and of evidence on which to found that declamation." It was under this impression that he went to the colonies, and the candid expression of his feelings on the subject of slavery, which we have quoted, must acquit him of any bias in favour of its abolition; and proves that his subsequent devotedness to the great cause of emancipation was the entire result of a conviction pressed upon him by an actual knowledge of the evils of the system. No sooner indeed was the slave-law of 1825 promulgated, and the slave enjoyed the liberty of freely communicating with his protectors, than numerous examples of revolting cruelty, brought before him in his official capacity, produced a rapid but lasting change in his opinions. In proportion to the extent of his inquiries was the depth of his conviction that the only remedy to the evil of slavery was the gradual emancipation of the slave. His views on this important subject are fully put forth in 'Four Essays on Colonial Slavery,' which he published on his return to Europe in 1831: in them he describes the general features of the slave communities, and the beneficial effect of the ameliorations already adopted, and he proceeds to show what he considers to be the further measures required for the entire annihilation of the system.

In 1832 he was appointed to the office of procureur- and advocate-general of the Mauritius. He had there to contend not only against objections of a personal nature, arising from his known opinions on the slave question, but against national and deep-rooted antipathies of a population almost entirely of French origin, and strongly attached to French institutions. The office moreover which he held presented peculiar difficulties to one who was determined conscientiously to perform the duties it imposed. The procureur-general, among the French, is an executive magistrate, and has to enforce the decrees of the courts, and he has under his control the police force of the country. When the disaffected party at the Mauritius heard of Mr. Jeremie's appointment to an office which we believe had hitherto been held by members of their own community, they broke out into an almost open rebellion. On his arrival before Port Louis, so great was the fear entertained for his personal safety by the British authorities, that all access to the shore was for a time forbidden him. The colonial assembly had petitioned the governor altogether to prevent his landing; their request being refused, after a detention of two days he went on shore, under the protection of the whole naval and military force in the island, and on the same day was sworn into office, at a meeting of the legislative council.

The many scenes of violence which ensued are fully detailed in a pamphlet entitled 'Recent Events at the Mauritius,' which he published in vindication of his conduct. It will be sufficient to mention that the governor thought it advisable, for the security of the public peace, to order him to return to England, he having previously declined to do so except a written command were given him to that effect. On his arrival in London he immediately reported himself to the colonial office, adding, that he was ready to resume his journey back to the Mauritius at an hour's notice. His request, though delayed, was granted, and his return to that island preceded by an additional military force. The feelings however originally excited against him did not easily subside, and his residence there, which terminated in 1835, was embittered by a series of painful events, arising from the fearless advocacy of his opinions.

In 1836 he was appointed to the office of puisne justice of the Supreme Court of Ceylon, and during the same year a valuable piece of plate was presented to him by the Anti-Slavery Society in testimony of the great service he had rendered to the cause of slave emancipation. His residence during four years at Ceylon was the only tranquil period of his eventful life. Early in the year 1840 he published a 'Letter on Negro Emancipation and African Civilisation,' addressed to Sir T. F. Buxton, in which he described the present and showed what he considered will be the future effects of emancipation in the colonies, and gave a short outline of the practical steps which might be taken in order to advance the civilisation of Western Africa.

It was to carry into effect the measures which had been suggested for ameliorating the condition of the liberated slaves that, undeterred by the perils of a pestilential climate, he accepted in October 1840 the important office of governor and captain-general of Sierra Leone and its dependencies, and he received at the same time the honour of knighthood. On the 23rd of April 1841, only four months after his arrival at Sierra Leone, he fell a victim to the prevalent disease of the climate, while engaged in a government mission at Port Lago. His only son, John Robert Jeremie, a young man whose talents promised high success in a career of honourable utility which had been opened to him in Europe, had at his own earnest request accompanied his father as private secretary, which appointment he held under the

succeeding governor until 1843, when he likewise fell a victim to the climate. The inhabitants of St. Lucia, when the news of his death reached them, marked their regret for his loss by a general mourning; but perhaps the highest tribute to his memory is to be found in an address made on that occasion to the Royal Court of St. Lucia by Dr. Rueda, who had succeeded him as chief justice of that colony. The following passages are contained in it:—"To say that Sir J. Jeremie was the ablest judge, was the most useful judge, who ever presided at St. Lucia, is saying little indeed. For the laws which he enforced, and the reforms which he introduced into the legal system of the colony, giving stability to commerce and security to the investment of capital, the planters and merchants recognise to him a deep debt of gratitude. Wherever you turn your eyes you meet the proofs of his activity in the discharge of the administrative duties which at one time devolved on the first president:—the high roads opened up and levelled, the paving and drains for the salubrity of the town, the erection of the Protestant church, all attest his unwearied and zealous labours. His memory will long be cherished by that class of the colonists whose equal rights he secured, and whose social position he upheld and vindicated both by precept and example, when, to use his own striking language, after having submitted to the minister of the crown (Sir George Murray) an argument on the grave colonial question, the distinction of colour, that eminent statesman recognised the policy and justice of a change, and the 'curse of heaven disappeared from the face of the western world.'"

JEROBOAM, the author of the schism in the Jewish kingdom, and the founder of the separate kingdom of Israel, had been a distinguished captain in the army of Solomon, but, probably on account of some oppression occasioned by the great expenditure of Solomon in building, he had rebelled; and on leaving Jerusalem the prophet Abijah foretold the separation, and that he should be king. Solomon upon learning this sought to slay Jeroboam, who found refuge in the court of Shishak, king of Egypt. On the death of Solomon he immediately repaired to Shechem, where the chiefs of the tribes had assembled to meet Rehoboam, and to remonstrate with him on the weight of the taxation. Rehoboam haughtily repulsed their suit, and therefore the ten tribes elected Jeroboam king in B.C. 990, leaving to Rehoboam only the tribes of Judah and Benjamin. Rehoboam returned to Jerusalem and assembled a large army, but on the intimation of the prophet Shemaiah that it would be contrary to the will of the Lord, he desisted.

Jeroboam, thus in possession of the throne, took up his abode at Shechem, which he made the capital of his kingdom. Feeling or imagining a danger in allowing his subjects to pay their accustomed devotions in the temple at Jerusalem, he caused two golden calves to be set up at the extremities of his dominions, at Dan and Bethel, rather as symbols it is supposed of the true God than as objects of direct idolatry; and as the Levites would not serve, made priests of the lowest of the people. Prophets were sent to protest against this desecration, and when Jeroboam would have arrested one his hand was withered, but restored at the prayer of the prophet. Notwithstanding this he continued his course. Although Rehoboam had abstained from attacking Jeroboam at first, the Scripture records that there were wars between them all the days of Rehoboam's life; and when in the eighteenth year of Jeroboam's reign Abijah succeeded to the throne of Judah, he assembled an army of 400,000 men, to whom Jeroboam opposed one of 800,000, and a battle took place in which Israel was defeated, and there were slain of them "500,000 chosen men." Some writers, among others Dr. Hales, think there is a cypher too many in each of the above numbers; but it is certain that from this period Israel was greatly weakened, and Judah increased in proportional strength. Though Abijah had achieved this great victory, no material consequences followed beyond taking a few towns, among which was Bethel, with one of the golden calves. Jeroboam continued to reign four years longer; he then died, and was succeeded by his son Nadab.

JEROBOAM II. was the son of Joash, king of Israel, and succeeded his father in B.C. 834, and reigned forty-one years. The scriptural records of his reign are but scanty. He maintained the heresy of his ancestors; but his father's victory over Amaziah, king of Judah, had given him strength, and he carried on a successful war against the Syrians, restoring "the coast of Israel from the entering of Hamath unto the sea of the plain," and he also subdued Damascus. In his reign lived the prophet Jonah. He was succeeded by his son Zachariah.

JEROME, SAINT (*EUSEBIUS HIERONYMUS SOPHONISUS*), one of the Fathers of the Church, and accounted the most learned of all the Latin Fathers. He was well acquainted with both the Greek and Hebrew languages.

His era was from 340, about which time he was born, to 420, in which year he died. He was a native of Pannonia, but came early to Rome, where he studied under the grammarian Donatus. When he had received baptism in token of his professing the Christian faith, he entered upon a long course of travel. He visited Gaul, where he remained some time, and afterwards travelled in Thrace, Pontus, Bithynia, Galatia, and Cappadocia. When he was about thirty he began to be noted for his theological knowledge. In a retirement which he had chosen for himself in Syria, he was disturbed on a

suspicion of the want of perfect soundness in the faith. This determined him to go to Jerusalem, and there apply himself to the study of the Hebrew language as the best means of enabling him to understand the Scriptures rightly, not only of the Old, but also of the New Testament. In 382 he returned to Rome, having spent some time at Constantinople on his way, where at that time lived St. Gregory of Nazianzus, a celebrated preacher. At Rome he became secretary to Pope Damasus. There appear to be circumstances in the life of Jerome at this period which are not cleared up. It is however certain that Sericicus, the successor of Damasus, had not the same esteem for him which Damasus had, and that Jerome left Rome and returned to the neighbourhood of Jerusalem. There he took up his abode in a monastery at Bethlehem.

In this retirement he employed himself in writing on the questions which then divided the opinions of Christians, and there it is believed he died, at the age of eighty years.

Many of the writings of Jerome have come down to us. Several of them are merely controversial; but there are others of a more sterling and lasting value: these are, his treatise on the Lives and Writings of the elder Christian Fathers, and his Commentaries on the Prophetical Books of the Old Testament, on the Gospel of St. Matthew, and several of St. Paul's Epistles. His Epistles amount, in the edition of Vallarius, to 150 in number. But what may be regarded as his greatest work is a translation of the books of both the Old and New Testament into Latin. This translation has been always highly valued in the Latin Church, and is that known in the Church by the name of the Vulgate. It is a question amongst the learned how far, and whether at all, he embodied an older Italic version in his translation. If it was the first effort at bringing the Scriptures within the reach of the great multitude who knew no other language than the Latin, it was a great and noble work, which ought to place its author high amongst the benefactors of mankind. Bishop Warburton says of Jerome, that "he is the only Father that can be called a critic on the sacred writings, or who followed a just or reasonable method of criticising." A treatise of his was one of the first books printed in England. The best edition of his works is that of Vallarius, in 10 vols. fol., Verona, 1734-42; reprinted by Venet in 1766, in 11 vols. 4to., Paris.

JEROME OF PRAGUE, so called from the place of his birth, was one of the earliest, ablest, and most devoted of the followers of John Huss. [*HUSS, JOHN.*] He was endowed with great natural ability, which had been carefully cultivated, he having studied at the universities of Paris, Heidelberg, and Cologne, from each of which he received the degree of Doctor of Divinity. In extent of learning and acquaintance with scholastic logic he was regarded as superior to his master, and he was by far the most effective of his preachers. From almost the commencement of the 5th century Jerome was indefatigable in proclaiming the Hussite doctrines through the principal towns of Bohemia and Hungary, and he also visited Poland. When Huss appeared before the Council of Constance, Jerome was cited by that body also. In reply he affixed a paper upon the doors of the churches of Constance, stating his willingness to appear before the council and to defend his teaching, if a safe conduct were furnished him. His challenge being left unnoticed, he prepared to return to Bohemia. A passport was now sent him from the council, guaranteeing his safety from violence, but not from punishment, if he were adjudged guilty of the heresy charged against him; but this Jerome—Huss having been already sent to prison—deemed insufficient, and he proceeded on his journey. On his way he was arrested, April 25, 1415, and delivered over by the Prince of Salzburg into the power of the council, May 23. He underwent the usual interrogatories, in the intervals being subjected to excessively cruel treatment in prison. The point which he was chiefly required to retract was his opinion on the doctrine of Transubstantiation; and on the third examination, on the 11th of September 1415, he made a qualified recantation of the Hussite statement of the eucharistic theory. But even this admission he passionately disclaimed at a public audience on the 26th of May following. "Confessing with horror," his cowardice, he declared that "only the dread of the punishment by fire had brought him to consent, against his conscience, to the condemnation of the doctrine of Wycliffe and John Huss." He was at once condemned, and delivered over to the secular power; and four days after was burned. Like Huss he proceeded to the stake with the greatest serenity, and the manner of his death produced a powerful impression. Bracciolini, who was present at the execution, bears full evidence in his letter to Aretino to the firmness of the victim, and so does Aeneas Sylvius, afterwards Pope Pius II., in his 'Historia Bohemica.'

***JERROLD, DOUGLAS.** With the higher order of minds every surrounding circumstance, especially of their earliest years, is education. The education of the child Douglas Jerrold was within the verge of a theatre; the education of the boy was on the deck of a man-of-war; the education of the youth was in a printing-office. We can trace the fields of observation in which the dramatist, essayist, and journalist gathered his materials, and in which his habits of thought and study were formed. Douglas Jerrold was born in London, on the 3rd of January 1803. His father was manager of the Sheerness Theatre: the "many-coloured life" of the drama was thus familiar to him in his first years; and those who know how strong are the

impressions which an intelligent child thus receives will understand the influence of this experience upon the pursuits of the man. But the boy was surrounded by grand and most attractive realities: the docks and the arsenal of Sheerness—ships coming home to refit after tedious cruises—sailors who could talk of the Nile and Trafalgar. The lad, delicate, sensitive, was smitten with a passion for the life at sea; and, his wishes prevailing, a midshipman's appointment was obtained for him from Captain Austen, brother of Miss Austen, the novelist. At the end of the war he quitted the service, and another calling had to be chosen. He was apprenticed to a printer in London. The labours of a printer's apprentice are not ordinarily favourable to intellectual development; the duties of a compositor are so purely mechanical, and yet demand such a constant attention, that the subject-matter of his employ can rarely engage his thoughts. It was not in the printing-office that the mind of Douglas Jerrold was formed, although the aspirations of the boy might have thought that there was the home of literature. He became his own instructor after the hours of labour. He made himself master of several languages. His "one book" was Shakspeare. He cultivated the habit of expressing his thoughts in writing; and gradually the literary ambition was directed into a practicable road. He was working as a compositor on a newspaper, when he thought he could write something as good as the criticism which there appeared. He dropped into the editor's letter-box an essay on the opera of 'Der Frieschütz,' which performance he had witnessed with wonder and delight. His own copy, an anonymous contribution, was handed over to him to put in type. An earnest editorial "notice," soliciting other contributions from our "correspondent," &c., was the welcome of the young writer, whose vocation was now determined. His first dramatic production, 'Black-eyed Susan'—the most popular drama of modern times, or of any time—was written before Mr. Jerrold had attained his twenty-first year. It was produced at the Surrey Theatre, with a success which Elliston, the manager, very unequally shared with the struggling author. It deferred the ruin of Drury Lane Theatre for a season. The original 'William' boasted, a year or two ago, that he had appeared in the part seven hundred times. 'The Rent Day' followed this first triumph. Jerrold was now the most popular dramatist of the period; and he has continued to write for the stage till within the last few years. Equally a master of wit and of pathos, all his plays have a decided originality; they are thoroughly English. His serious dramas are built upon English home affections. The joys and griefs of his scenes are not the tawdry sentimentalities and extravagant passions of adaptations from the French—gaudy exotics, which flower for a little while under artificial cultivation, and then are thrown away as worthless weeds. Jerrold's comedies are also as thoroughly English in their characterization and their language: they have the true ring of the old national currency of wit and humour and keen satire; but they require excellent actors and intelligent audiences, and, according to some authorities, these requisites for a high drama are passing away. In our day the gratification of the eye, in preference to every other faculty, has degraded Shakspeare, even, from a poet to a showman; and this false taste naturally extends to other walks, to make exaggeration the great requisite of the dramatic artist. Mr. Jerrold's most successful plays, in addition to those we have mentioned, are 'Nell Gwynne,' 'The Prisoner of War,' and 'The Housekeeper;' and amongst his comedies we may especially mention 'Time works Wonders,' and 'The Bubbles of the Day.' Of the latter there has been recently published a German translation, executed with remarkable spirit and fidelity.

A portion of Mr. Jerrold's dramatic works, with the more important of his stories and miscellaneous writings, have been collectively published in eight volumes. Here we find the 'Men of Character,' originally published in 'Blackwood's Magazine;' 'Cloverhook,' which appeared in 'The Illuminated Magazine;' 'St. Giles and St. James,' written for 'Jerrold's Shilling Magazine;' 'The Story of a Feather,' and 'The Caudle Lectures,' which gave such an impulse to the popularity of 'Punch.' For this famous journal he has regularly written from the second number. In this constant round for thirty years of a very peculiar form of literary labour, where the strongest effects are produced by epigrammatic terseness, we trace a life of unremitting industry, combined with very rare natural gifts improved by diligent cultivation. The flippant satirist—and we have many such amongst the young race of periodical writers—who pours out his invectives without impartial observation or accurate knowledge, belongs only to the passing hour. Jerrold's satire has always a foundation of truth and earnest purpose, and therefore it lives. In his most ephemeral writings we may trace that wide acquaintance with the best literature which is somewhat too much despised by those who believe that a brilliant writer, to use a familiar phrase, can make everything out of his own head. For three or four years Mr. Jerrold has been the editor of 'Lloyd's Weekly Newspaper'—a journal of so enormous a circulation that its conduct involves a tremendous moral responsibility. Whatever objection there may be to the strongly expressed opinions, the invective, or the sarcasm of this paper under its present management, it has never aimed at popularity by false and dangerous doctrines upon the great principles of society and government. Its present success, compared with its previous position, is one of the many proofs that the largest number of readers are not to be pro-

pitiated by what has been falsely considered as essential to popularity—to write down to an imaginary low intellectual standard.

JERVAS, CHARLES, the portrait painter, was born in Ireland about 1675; the exact date is not known. He studied a year with Kneller in London, copied the cartoons of Raffaele at Hampton Court, in small, and studied also in Paris and at Rome. He returned to London about 1708, where, through the intimate friendship of Pope, and a fortune of 20,000*l.* which he acquired with his wife, a widow, he was enabled to overcome all the usual difficulties attendant upon a professional life in its up-hill career. His sole ability as a painter seems to have been his power of copying: some of his copies after Carlo Maratte are, according to Walpole—a very unsafe authority however—equal to the originals. He appears to have been inordinately conceited, due no doubt in a great measure to the silly flattery of his friend and pupil Pope, in his 'Epistle to Jervas.' There are several anecdotes related of his vanity: on one occasion, when he had finished a copy after Titian, he said, looking with the utmost satisfaction from one to the other, "Poor little Tit, how he would stare." Jervas died November 2, 1739.

JERVIS, JOHN, Earl of St. Vincent, and Admiral of the Fleet, was born at Meaford in Staffordshire, January 9, 1734, o.s.; entered the navy at ten years old; was posted into the Gosport, 40 guns, in 1760; and appointed to the Foudroyant, 80, in 1774. In this ship, which was distinguished for her discipline and effective state, he fought in Keppel's action in 1778; captured the Pégase, French 74, in 1782, for which he received the order of the Bath; and in October of the same year sailed with Lord Howe to the relief of Gibraltar. He was promoted to the rank of rear-admiral, September 24, 1787; and sat in parliament for various boroughs from 1782 until the breaking out of the French Revolutionary war, when he sailed in command of a squadron to reduce the West India Islands, and captured Martinique, Guadaloupe, and St. Lucia. At the end of 1791 sickness drove him home. He was promoted to be Admiral of the Blue, June 1, 1795, and in the autumn took command of the Mediterranean fleet, with which he performed the great exploit of his life, by intercepting and defeating the Spanish fleet off Cape St. Vincent, on February 14, 1797. The disproportion of force was greater, it is said, than any modern officer had ventured to seek an encounter with, the Spaniards having nearly double our number of ships, and more than double the number of guns and weight of metal. However Jervis, repeating Rodney's method of breaking the line, gained a complete victory, and captured four sail of the line. In this celebrated engagement the services of Nelson were pre-eminent. The actual loss sustained by the enemy was of less importance than the lustre cast on the British arms by a victory achieved against such odds. Thanks, couched in the most flattering terms, were voted by both houses of parliament; and Sir J. Jervis was raised to the peerage by the title of Earl of St. Vincent and Baron Jervis of Meaford, and received a pension of 3000*l.* Shortly after, his presence of mind and moral courage were severely tried by the breaking out of a branch of the Channel mutiny in his fleet; which however was speedily suppressed by his judicious and decisive severity. Having suffered for some time from ill health, he returned home in 1799; but in April 1800 took command for a short time of the Channel fleet, on the resignation of Lord Bridport. He was made first Lord of the Admiralty in February 1801, on the formation of the Addington ministry; and having through life had a sincere dislike of speculation and jobbing, at once set vigorously to cut down extravagant expenditure and to reform abuses. This of course made him very unpopular; and he was accused of rashness, and of crippling the resources of the country by a false economy. Charges of this sort were then sure to be made against those who exerted themselves to reform old and lucrative abuses. Mr. Pitt partook of the dissatisfaction, and at his return to office, in May 1804, placed Viscount Melville at the head of the Admiralty. Earl St. Vincent again took command of the Channel fleet in 1806, in Fox's administration, but held it only for a year. His last appearance in parliament appears to have been in 1810, in the debate upon the king's speech, when he spoke strongly in censure of the conduct of the war by ministers. He was appointed Admiral of the Fleet on the day of George IV.'s coronation, July 19, 1821, and died March 15, 1823, in the ninetieth year of his age. Having no children, the earldom became extinct: but the title of Viscount, by special grant, descended to his nephew Mr. Ricketts. A public monument was erected in honour of him in St. Paul's cathedral.

Earl St. Vincent's professional characteristics were courage, coolness, and decision, amounting almost to sternness of character: these, united with great skill and indefatigable activity, rendered him an admirable officer. He was very independent; and the disposal of his patronage, in which he paid great and unusual consideration to the claims of deserving officers, did him honour.

JESUS CHRIST.

[The following sketch of the events of the Life of our Saviour, as derived from the New Testament, avoids all reference to matters of controversy, either as to facts or opinions. The plainest narrative in a work like this best expresses the reverence with which we approach the subject.]

Jesus Christ was born at Bethlehem, a city of Judæa, in the days of King Herod. The first chapter of St. Matthew contains the

genealogy of Jesus deduced from Abraham through David to his reputed father Joseph. The third chapter of St. Luke contains his pedigree from Joseph to Adam. From Joseph to David, the two genealogies are entirely different; but this discrepancy is satisfactorily explained by the commentators. The birth of Jesus was miraculous; "when his mother Mary" (according to the words of St. Matthew) "was espoused to Joseph, before they came together, she was found with child of the Holy Ghost." Joseph, who intended to put her away privately, being warned in a dream by the Angel of the Lord, that what was "conceived in her was of the Holy Ghost, took unto him his wife and knew her not till she had brought forth her first-born son; and he called his name Jesus." (Matt. i.) Herod was much troubled at the miraculous circumstances which attended the birth of Jesus, and at the coincidence of the place of his birth with the prophecies. In order therefore that the infant might with certainty be destroyed, he gave orders that all the male children in Bethlehem and the neighbourhood under two years of age should be put to death; but Jesus was saved by his parents, who were warned by an angel in a dream to take the child into Egypt. This part of the sacred history is recorded by St. Matthew only. According to St. Luke, when the days of the purification of Mary were accomplished his parents took him from Bethlehem to Jerusalem to present him in the Temple, after which they returned to their own city Nazareth in Galilee. At twelve years of age Jesus disputed with the Jewish doctors in the Temple at Jerusalem, whom he astonished by his answers and his understanding. Towards his parents his conduct was an example of filial obedience. He was not above following the business of his reputed father, which was that of a carpenter; and until about his thirtieth year he fulfilled the common duties of life in an humble and obscure station. His public ministry was preceded by the warnings and admonitions of John the Baptist, the son of a Jewish priest, who called upon the people to repent and believe, for the time was fulfilled, and the kingdom of God was at hand. Jesus was baptised by John in the river Jordan, and shortly after commenced his ministry, being about thirty years of age. For about the space of three years he was engaged in the work of promulgating his doctrines, and confirming his divine mission by numerous miracles. In order to diffuse that religion which he came to make known, he selected a certain number of persons to be his constant companions, to learn his doctrines, to witness their influence, to testify to the miracles by which their truth was demonstrated, and to be prepared to propagate after his death the truths which he had thus made known. The twelve persons whom he chose are called the Twelve Apostles. They were ignorant persons, who possessed neither wealth, rank, nor education, and yet they were called to root out opinions which were deeply implanted in men's minds, and to overturn systems strengthened by all the influence which ancient and venerable authorities exert over the mind. He next appointed from among his followers seventy disciples, whom he sent by twos to every place which he himself intended to visit. (Luke x. 1.) This appointment of the seventy disciples is not mentioned by the other evangelists. Many of the Jews being convinced by the preaching of Jesus, and the miracles which he wrought among them, of his divine mission, the Jewish priesthood were alarmed, and sought some means of accomplishing his death. Being betrayed by Judas, one of the twelve whom he had chosen, he was taken before the Jewish court of the Sanhedrim, which had the cognisance of offences against religion, and from thence to the tribunal of Pontius Pilate, the Roman procurator or administrator of the revenues of the province. Before the former he was accused of blasphemy, a charge which was supported by two false witnesses; and before Pilate as a seditious person, and a stirrer up of disaffection, a charge which was also totally without foundation. But the Jews clamoured for his death; and though Pilate saw nothing in the accusations brought against him worthy of capital punishment, he was sentenced to death in compliance with the clamour of the people, and apparently also from fear of some disturbance. In the midst of their scoffing and jeers he was led to the place of execution, and crucified, with circumstances of the greatest cruelty, between two criminals. On the third day Christ rose from the grave, according to his own prediction (Mark x. 34), and during forty days previous to his ascension into heaven he appeared among his disciples, whom he instructed more fully concerning the nature of his mission, which he now left in their hands. Fifty days after his ascension, the disciples, being assembled in Jerusalem at the feast of Pentecost (Acts ii.), were suddenly "all filled with the Holy Ghost," and endowed with the gift of speaking all languages. On this occasion three thousand persons were converted and received baptism. Being thus fitted for disseminating in every part of the world the principles of the new religion, the apostles and disciples whom Christ had appointed, scattered themselves throughout various countries, but principally in the east. Matthias had been chosen to supply the place of Judas, the traitor, and an additional disciple, named Saul, afterwards Paul, a person of education, and though a Jew, a Roman citizen of Tarsus, was especially called to co-operate with them.

The history of Jesus Christ has been written by four different individuals, whose accounts are received by the Christian world, and some of the arguments for the credibility of their testimony are founded upon the mode in which they accomplished their task.

Matthew, who had been a collector of customs, wrote his Gospel in Hebrew for the use of the Jews soon after Christ's death; Mark is believed to have written under the direction of Peter, for the use of the Christians at Rome; Luke, whose Gospel was written for the Heathen converts, was a physician, a companion in the labours of St. Paul, and is supposed to have written his account of Christ while travelling with the apostle; John's Gospel was written after all the preceding, and notices circumstances which the other evangelists had passed over. That part of the New Testament which follows the four Gospels was also written by St. Luke, and gives the Acts of the Apostles, and the history of Christianity, for about thirty years after Christ's death.

The primitive assemblies of the converts to Christianity were called Churches (*Εκκλησιαί*). The converts at Jerusalem formed the earliest Christian society. The church of Antioch, which was founded by Paul and Barnabas, was the second; and its members first received the name of Christians, having previously been called Nazarenes, by way of derision. The first churches or Christian communities were those of Jerusalem, Antioch, Ephesus, Smyrna, Athens, Corinth, Rome, and Alexandria. The churches founded by the apostles were regarded with peculiar veneration in after times. Their authority was appealed to on points of discipline and doctrine, as it was conceived that the letter and spirit of the apostolical regulations had been more rigidly adhered to by them. The church of Jerusalem may be regarded as the mother of all other churches; but the church at Rome, then the capital of the world, subsequently became, with the churches of Antioch and Alexandria, which were respectively capitals of Roman provinces, by far the most important of all the churches. The four churches of Jerusalem, Antioch, Rome, and Alexandria were formed in the order in which they are mentioned, though some doubt exists as to the title of the church of Rome to priority over that of Alexandria. The church of Rome became the metropolitan of the west, while that of Antioch was regarded as the chief of the eastern churches. As the apostles extended their travels, churches were planted in various parts of Asia. Paul and Barnabas visited the islands of Cyprus and Crete, and various parts of Greece, where they made converts to Christianity. In a second visit to the churches which were formed by Paul, he regulated some of the practices into which the converts had fallen. At Corinth he remained eighteen months, during which period he exerted himself to establish firmly the faith of the Christian believers, which in that church was exposed to peculiar dangers. When unable to visit distant churches, he addressed them in Epistles. Paul next directed his attention to the west of Europe, to nations "that were yet rude and barbarous." There is no certain record of this portion of his travels. The writings and labours of St. Paul, who is emphatically called the apostle of the Gentiles, form the most important part of the history of the second period of Christianity. In less than forty years after the death of Christ the Gospel had been preached in every country of the then civilised world, and in some countries which were in a state of barbarism. In the year 68, that is thirty-seven years after Christ's death, Peter and Paul suffered martyrdom at Rome.

The records as to the other apostles do not afford an adequate idea of the extent of their labours. John was banished to the island of Patmos by Domitian, and there wrote the Revelations. He was subsequently permitted to return to Ephesus, where he wrote his gospel and epistles. He was the last survivor of the apostles, and died a natural death at the close of the first century, about the year 98. The seven churches mentioned by John in the Revelations are Ephesus, Smyrna, Pergamus, Thyatira, Sardis, Philadelphia, and Laodicea.

JESUS, son of Sirach, was a learned Jew of Jerusalem, who employed himself in collecting sayings of wise men, from which, with additions of his own, he formed the book of Ecclesiasticus. ('Ecclesiasticus,' c. l., v. 27.) We know little of him but what we can gather from that book. According to Bretschneider, he composed it about B.C. 180; a date which is rendered probable by the fact that, in enumerating the illustrious men of the Hebrew nation, the last he mentions is the high-priest Simon, the son of Onias, of whom he speaks in terms which make it probable that he had seen him, while he does not mention the Maccabees.

Another JESUS, a grandson of the former, and whose father's name is also supposed to have been Sirach, translated the book of Ecclesiasticus into Greek, probably about B.C. 130; for he states in his prologue to the book that he went into Egypt in the reign of Euergetes (Ptolemy VII., Euergetes II.), and there executed the translation.

This is the general opinion; but Jahn thinks it probable that Jesus composed the book of Ecclesiasticus about B.C. 292-280; that the Simon, son of Onias, whom he praises, was the first of that name, not the second; and that his grandson executed the translation under Ptolemy Euergetes I., who reigned B.C. 247-222. He founds this opinion chiefly on the character of Simon I. agreeing with the eulogy of the writer better than that of Simon II.

(Bretschneider, *Liber Jenu Siracida*; Horne, *Introduction*, vol. iv.; Jahn, *Introd. in Lib. Sac. V.æ. Pœd.*)

JEWELL, JOHN, one of the fathers of the English Protestant Church, was born in 1522 in Devonshire, and educated in grammar-schools in that county, till at the age of thirteen he was sent to Oxford,

where he was entered at Merton College, under the tuition of John Parkhurst, who was afterwards the Protestant bishop of Norwich. When eighteen he was admitted B.A., and at that early age he became a college tutor. Henry VIII. was still upon the throne, and it was hazardous for any one to make himself conspicuous either as an opposer of the principles of the reformation or as an advocate of them. Jewell therefore kept himself quiet, contenting himself with inculcating reformation principles privately in his lectures to his pupils; but when King Henry was dead, and the ecclesiastical policy of the country became more decidedly Protestant under his successor, Jewell declared himself openly a zealous Protestant; and when Peter Martyr, one of the foreign reformers, visited Oxford, and there held a public disputation (as was the manner of those times) with certain learned Roman Catholic divines, Jewell acted as his notary. From this time he became a zealous promoter of the reformation, both at the university and as a preacher and catechiser in the country about Abingdon, where he had a living.

Times however changed: King Edward died, and a new policy was adopted. It was sought to undo what had been done. Jewell, it seems, for a short time somewhat temporised; but he very soon recovered himself, and sought shelter in a foreign land from the severity of the storm which fell upon those who in the preceding reign had been zealous for the reformation. He joined the English exiles at Frankfurt, and afterwards at Strasbourg, where he again met with Peter Martyr, whom he assisted in the composition of some of his works. The reign however of Mary was short, and with the accession of Elizabeth came brighter prospects to the friends of reform. Jewell returned home, and was almost immediately made Bishop of Salisbury. His zeal was not relaxed. He continued both by his preaching and his writing to promote the doctrines of the reformation, and to endeavour to extinguish whatever attachment there might still remain, especially in any part of his own diocese, to the older system. He died in the course of one of his preaching tours at the little village of Monkton Farleigh, in an obscure corner of his diocese, in the fiftieth year of his age. Camden, whose testimony is worth more than that of any party writer on either side, bears to him this testimony, that he was a man of singular ingenuity, of vast erudition in theology, and of eminent piety.

The writings of Jewell are chiefly controversial, the most remarkable of them being his 'Apology for the Church of England,' and his various Defences of that Apology. These are together considered one of the ablest defences of the Protestant Church of England that appeared, and were translated into many languages for the purpose of circulation abroad. His writings were collected in a large folio volume in 1609. Copies of this volume were placed in many of the English churches for the common use of the parishioners, and may sometimes even now be found fastened by a chain to a reading-desk. This honour it has shared with Fox's 'Acts and Monuments of the Church,' and some of the theological writings of Erasmus.

The writings of Jewell are still greatly valued, and are much used in two departments of ecclesiastical controversy, the question between the Church of England and the Church of Rome, and the question respecting the doctrinal sentiments of the fathers of the Protestant Church of England. Lists of his writings may be seen in the 'Athenæ Oxonienses' of Anthony Wood, where is an outline of his life, the particulars of which have been written more in detail by many persons.

JOAM (or JOÃO) I. to VI., Kings of Portugal. [PORTUGAL, vol. iv.]

JOAN I. of Naples, daughter of King Robert of Naples, of the Anjou dynasty, succeeded her father in 1343. She was then only sixteen years of age, handsome and accomplished. She had been married already some time to her cousin Andreas of Hungary, but their tempers and tastes did not sympathise together. Andreas claimed to be crowned king and to share his wife's authority, which by the will of her father had been left solely to her. His coarse and haughty manners offended the proud native barons, and the Hungarian guards who attended him excited their jealousy. A conspiracy was formed, and one night, while the court was at Aversa, the conspirators, who were of the nobles near his person, seized and strangled him, and threw his body out of a window of the castle. There seems little or no doubt that Joan knew of the plot, and that she did nothing to prevent the crime. As soon as it was perpetrated she repaired to Naples, and thence issued orders for the apprehension of the murderers. Torture was employed to find out the conspirators, but the result of the interrogatories was kept secret. Many persons high and low were put to a cruel death, but public opinion still implicated the queen herself in the conspiracy. The same year Joan married her relative Louis, prince of Tarentum. Louis, king of Hungary, and brother of Andreas, came with an army to avenge his brother's death. He defeated the queen's troops, entered Naples, and Joan took refuge in her hereditary principality of Provence. She repaired to Avignon, and there, before Pope Clement VI., she protested her innocence and demanded a trial. The pope and his cardinals acquitted Joan, who from gratitude gave up to the papal see the town and county of Avignon. A pestilence in the meantime had frightened away the Hungarians from Naples, and Joan, returning to her kingdom, was solemnly crowned with her husband in 1351. Joan reigned many years in peace over her

fine dominions. Having lost her second husband in 1362, she married a prince of Majorca, and on his death she married in 1376 Otho, duke of Brunswick; but having no children by any of her husbands, she gave her niece Margaret in marriage to Charles, duke of Durazzo, who was himself related to the royal dynasty of Anjou, and appointed him her successor. Soon afterwards the schism between Urban VI. and Clement VII. broke out, and Joan took the part of the latter. Urban excommunicated her, and gave the investiture of the kingdom to Charles Durazzo, who with the darkest ingratitude revolted against his sovereign and benefactress: with the assistance of the pope he raised troops, defeated the queen, and took her prisoner. He tried to induce Joan to abdicate in his favour, but the queen firmly refused, and named as her successor Louis of Anjou, brother of Charles V., king of France. Charles then transferred Joan to the castle of Muro in Basilicata, where he caused her to be strangled or smothered in her prison in 1382, thirty-seven years after the death of her first husband Andreas.

JOAN II., daughter of Charles Durazzo, and sister of Ladislaus, king of Naples, succeeded the latter after his death in 1414. She was then forty-four years of age, and already noted for licentiousness and weakness of character. After her exaltation to the throne she continued in the same course, only with more barefaced effrontery. She however married, from political motives, James, count de la Marche, who was allied to the royal family of France; but the match, as might be expected, proved most unhappy. James was obliged to run away in despair from Naples, and retired to France, where it is said that he ended his days in a convent. Meanwhile unworthy favourites ruled in succession at the court of Joan. One of them, Ser Gianni Caracciolo, of a noble family, saw his influence disputed by the famous condottiere Sforza Attendolo, who, together with many barons that were jealous of Caracciolo, took the part of Louis of Anjou, a grandson of that Louis to whom Joan I. had bequeathed the crown. The queen sought for support in Alfonso of Aragon, king of Sicily, whom she adopted, and appointed her successor. Alfonso came to Naples; but the fickle Joan having made her peace with Sforza, revoked her adoption of Alfonso, and appointed Louis of Anjou as her successor. Alfonso was accordingly obliged to return to Sicily. The favourite Caracciolo was soon after murdered in consequence of court jealousy and intrigue. Louis of Anjou died also, and was followed to the grave by Joan herself, who, on her death, appointed René of Anjou as her successor. She died in 1435, leaving her kingdom in great disorder, and with the prospect of a disputed succession and a civil war. [ALFONSO V. of Aragon, vol. i. col. 139.]

JOAN, POPE, a supposed individual of the female sex, who is placed by several chroniclers in the series of popes between Leo IV. and Benedict III., about 858-55. The first who mentions the story is Marianus Scotus, a monk of the abbey of Fulda, who died at Mainz in 1086, and who says in his chronicle, under the year 853, the thirteenth year of the reign of the Emperor Lotharius, that Leo IV. died on the 1st of August, and that to him succeeded Joan, a woman, whose pontificate lasted two years, five months, and four days, after which Benedict III. was made pope. But Anastasius, who lived at the time of the supposed Pope Joan, and who wrote the lives of the popes down to Nicholas I., who succeeded Benedict III., says, that fifteen days after Leo IV.'s death Benedict III. succeeded him. It is true that some manuscript copies of Anastasius, among others one in the king's library at Paris, contain the story of Joan; but this has been ascertained to be an interpolation of later copyists, who have inserted the tale in the very words of Martinus Polonus, a Cistercian monk and confessor to Gregory X., who wrote the lives of the popes, in which, after Leo IV., he places "John an Englishman," and then adds, "Hic, ut asseritur, femina fuit." He then goes on to say that this Joan, when a young woman, left her home in man's disguise, with her lover, a very learned man, and went to Athens, where she made great progress in profane law; afterwards she went to Rome, where she became equally proficient in sacred learning, for which her reputation became so great that at the death of Leo she was unanimously elected as his successor, under the general belief of her male sex. She however became pregnant; and one day as she was proceeding to the Lateran Basilica, she was seized in child-labour on the road between the Colosseum and the church of St. Clement, and there she died and was buried without any honours, after a pontificate of two years, five months, and four days. The story was generally copied from Martinus by subsequent writers, and Platina himself, in his 'Lives of the Popes,' repeats it on the authority of Martinus, adding various other reports, and concluding with these words: "The things I have above stated are current in vulgar reports, but are taken from uncertain and obscure authorities, and I have inserted them briefly and simply, not to be taxed with obstinacy." Panvinius, Platina's continuator, subjoins a very critical note, in which he shows the absurdity of the tale, and proves it to have been an invention. But the best dissertation on the subject is that of David Blondel, a Protestant, who completely refutes the story in his 'Famlierclairissement de la question si une Femme a été assise au Siège Papal entre Leon IV. et Benoit III., Amsterdam, 1649. There are critics who contend that it is only the later manuscripts of the 'Lives of the Popes' by Martinus Polonus which contain the tale of Pope Joan, and that those manuscripts which were written during the life or soon

after the death of Martinus do not contain it. It is evident however that the story was in circulation already in the 12th century, long before the time of Martinus, as Etienne de Bourbon de Belleville, a companion of St. Dominic, in his treatise 'De Septem Donis Spiritus Sancti,' under the head of 'Prudentia,' relates from 'the Chronicles' the story of Pope Joan, but places it about the year 1100, and says that on the discovery of her sex she was stoned to death by the people. These authorities prove at all events that the Protestants did not invent the tale of Pope Joan, as they have been accused of having done.

JOAN OF ARC. [ARC, JOAN OF.]

JOANES, or JUANES, VICENTE, a celebrated Spanish painter, was born at Fuente la Higuera in Valencia, in 1523. Palomino's account therefore, that he was the scholar of Raffaele, is an error. He studied in Italy, and, as we may infer from his style, chiefly the works of the Roman school. He died on the 21st of December 1579, whilst engaged in finishing the altar-piece of the church of Bocairente, and was buried in that town, but his body was removed to Valencia and deposited in the church of Santa Cruz in 1581.

Joanes was one of the best of the Spanish painters: he is acknowledged as the head of the school of Valencia, and is sometimes termed the Spanish Raffaele. His drawing is correct, and displays many successful examples of foreshortening; his draperies are well cast, his colouring is sombre (he was particularly fond of mulberry colour), and his expression is mostly in perfect accordance with his subject, which is generally devotion or impassioned resignation, as in the 'Baptism of Christ' in the cathedral of Valencia. Joanes' subjects are exclusively religious, and if, says Ceán Bermudez, Morales on this account deserved the title of *El Divino*, Joanes is equally entitled to it. Like his countrymen Vargas and D'Amato of Naples, he is said to have always taken the sacrament before he commenced an altar-piece. His best works are in the cathedral of Valencia, and there are several good specimens in the Prado at Madrid. To mention a minor quality of his works, he excelled in painting hair.

Joanes had many scholars, among whom his son Juan Vicente was not undistinguished. His daughters also, Dorotea and Margarita, were well known for their ability in painting.

(Ceán Bermudez, *Diccionario Historico, &c.*)

JOASH, or JEHOASH, King of Judah, was the son of Ahaziah, and when Athaliah murdered her grandsons he alone escaped, having been saved by the care of his aunt Jehosheba. [ATHALIAH.] After being concealed in the Temple by his uncle Jehoiada, the high-priest, during the six years that Athaliah reigned, he was produced, and at once proclaimed king. Athaliah was slain; and as Joash was only seven years old, his uncle Jehoiada acted as regent. Under Jehoiada's guidance the Temple was purified, and idolatry extirpated. In the twenty-third year of his reign, still prompted by Jehoiada, the Temple was thoroughly repaired, soon after which Jehoiada died, aged 130, and was buried among the kings. After his death there was a relapse to idolatry, against which Zechariah, the son of Jehoiada, protested, and was put to death with the consent of Joash. In the same year Hazael, king of Syria, invaded Judah, defeated the large army sent against him, and destroyed the princes at whose solicitation Joash had restored the high places. The king himself was wounded, but he purchased the withdrawal of Hazael by giving up to him all the treasures of the temple. His servants however conspired against him, and slew him in his bed in B.C. 849, after a reign of forty years. He was succeeded by Amaziah.

JOASH, or JEHOASH, King of Israel, was the son of Jehoahaz, and succeeded his father in B.C. 850. He did evil in the sight of the Lord, as his predecessors had done; but he visited Elisha when he was dying, lamented over him, and the dying prophet predicted his victories over the Syrians. He vanquished Ben-hadad in three battles, and recovered the cities of Israel from the dominion of the Syrians. He was next attacked by Amaziah, king of Judah, whom he defeated, entered Jerusalem, plundered the temple, and broke down four hundred cubits of the city wall; but he suffered Amaziah to retain his crown, taking hostages for his future good behaviour. After a reign of sixteen years he died, and was succeeded by Jeroboam, his son.

JOB, the Book of, is one of the poetical books of the Old Testament. Its title is taken from the patriarch Job, whose story it relates. Some critics have supposed, from the nature of the exordium, that Job was not a real person, and that the narrative in the book is fictitious. He appears however to be referred to as a real person by Ezekiel (ch. xiv. ver. 16), and James (ch. v. ver. 11); and the style of the book has all the circumstantiality of a real narrative. It has been inferred from his longevity (ch. xlii. 16), his holding the office of priest in his own family (ch. i. 5), his allusion to no other species of idolatry than the worship of the heavenly bodies (ch. xxxi. 26-28), the silence of the book respecting the history of the Israelites and the Mosaic laws, and several incidental allusions to patriarchal customs, that Job lived in the patriarchal age. Dr. Hales has attempted, by astronomical calculations, to fix the exact time of Job's trial at 184 years before the birth of Abraham. (Hales, 'Chronology,' vol. ii. pp. 55-57, sec. edit.) There is a genealogy of Job at the end of the Septuagint version of this book, which makes him the fifth in descent from Abraham. Some critics have discovered what they consider proofs of a much later date in the book itself.

The scene of the poem is laid in the "land of Uz," which, as Bishop Lowth has shown, is probably Idumæa. The language is Hebrew, with a considerable admixture of Arabic, or, as others contend, of Aramaic.

The author is unknown. The arguments already stated with respect to the age at which Job lived are considered by most critics to prove the very high antiquity of the book. Lightfoot and others have supposed that Elihu was the author. This idea is founded chiefly on a translation of ch. xxxii. 16-17, the correctness of which is very doubtful. A very general opinion among critics ascribes it to Moses. Dr. Mason Good has concluded, from the character of the book, that the writer must have possessed certain qualifications of style, knowledge, country, and age, which are to be found in Moses alone. The same writer has collected a number of passages in which he sees a resemblance to the sentiments and style of Moses. (Good, 'Book of Job, Prelim. Disc.' p. lvii, &c.) But the authority of Dr. Mason Good on such a subject is not very high, and on the other hand Bishop Lowth remarks, that the style of Job differs widely from the poetical style of Moses, being much more concise, and more accurate in the poetical conformation of sentences. Several critics, among whom is Eichhorn, assign to the book a date earlier than the time of Moses. Schultens, Lowth, and others suppose Job himself, or some contemporary, to have been the author, and that the book fell into the hands of Moses while he lived in Idumæa, and was used by him to teach the Israelites patience and submission to the will of God, either during their bondage in Egypt, or in their subsequent wanderings. It is alleged that this hypothesis solves the difficulties arising out of the internal character of the book, and accounts for its admission into the canon of the Hebrew Scriptures. Other critics assign a much later date to the book; several have ascribed it to Solomon, chiefly on the ground of a resemblance between certain passages in it and in the Proverbs. Umbreit places it at the time of the Babylonish captivity (Umbreit, 'Version of the Book of Job,' in the 'Biblical Cabinet,' Introduction).

The canonical authority of the Book of Job is established by frequent quotations from it, both in the Old and New Testament.

The design of this book appears to be to teach patience under suffering, from the doctrine of a Divine Providence governing all things. It consists of a controversy between Job and three friends who came to visit him in his distress, on the question whether men enjoy prosperity or suffer adversity in this life according as their actions are good or wicked. At ch. xxxii. a new disputant is introduced in the person of Elihu, who reproves both parties for the sentiments they had expressed; and at length the dispute is decided by the interposition of God himself. The integrity of Job, which his friends had called in question on account of his calamities, is vindicated, and he is restored to possessions twice as great as he had before his trial. (Compare James v. 10, 11.)

JODE, PIETER DE, the name of two celebrated engravers of Antwerp, father and son.

The elder, the son of Gerard de Jode, likewise an engraver, was born in 1570. He was the pupil of Golsius, studied and worked in Italy and at Paris, and died at Antwerp in 1634. De Jode engraved many plates in a good style, among them the remarkable picture of the 'Last Judgment,' by Cousin, in twelve sheets, making altogether about sixteen square feet, four each way: it is one of the largest prints in existence.

The younger De Jode, or PETRUS DE JODE, JUNIOR, as he signed himself on his prints, was born at Antwerp in 1606, and was instructed in engraving by his father, whom he soon surpassed in execution, especially in the nude, and equalled in correctness of drawing. He worked with his father in Paris. His numerous portraits after Vandyck are his best works; among them are his own, and those of Jordaens, Poelenburg, Suellina, De Coster, and others, painters of Antwerp. He executed also some good prints after Rubens. The date of his death is not known.

ARNOLD DE JODE was the son of the younger Pieter, and was born at Antwerp about 1636. He is said to have been in London in 1667, and then to have engraved a print after the picture by Correggio, which belonged to Charles I., of 'Mercury instructing Cupid,' which is now in the National Gallery. Scarcely anything is known of him personally: as an engraver he was inferior to his father and grandfather.

JOEL, one of the twelve minor Hebrew prophets. In the first verse of the first chapter of his prophecy we are told that he was the son of Pethuel. Beyond this we have no certain information respecting him. The pseudo-Epiphanius states that he was born at Beth-horon, on the confines of Judah and Benjamin. He prophesied in the kingdom of Judah, but in what reign is uncertain. The most probable opinion is that which places his prophecy in the reign of Uzziah, contemporary with Amos and Hosea, between B.C. 800 and 780. He appears to refer to the same events as Amos (compare Joel, ch. i. with Amos iv. 6-9, and Joel ii. 4-6 with Amos i. 9, 10); and he does not mention the Assyrians or the Babylonians among the enemies of Judah, but only Egypt and Edom (ch. iii. 19). Other opinions have referred him to the reign of Joram (B.C. 895-883), and to that of Manasseh (B.C. 697-642).

The prophecy of Joel may be divided into two parts. In the first

he describes a famine caused by the ravages of insects, and exhorts the people to repentance; denouncing still greater judgments if they continue impenitent, and promising the return of prosperity and plenty if they attend to his warning. The second part, beginning at ch. ii. 28, alludes to events much more remote. The prophetic passage in ch. ii. 28-32, is quoted by the apostle Peter as accomplished by the miraculous gift of tongues on the day of Pentecost (Acts ii. 17-21). The remainder of the prophecy is supposed to be at present unfulfilled.

The canonical authority of this book has never been disputed. It is established by other quotations in addition to the remarkable one just mentioned.

Bishop Lowth ('Prælect.,' xxi.) remarks on the style of Joel:—"He is elegant, perspicuous, copious, and fluent: he is also sublime, animated, and energetic. In the first and second chapters he displays the full force of the prophetic poetry, and shows how naturally it inclines to the use of metaphors, allegories, and comparisons. But while we allow this just commendation to his perspicuity both in language and arrangement, we must not deny that there is sometimes great obscurity observable in his subject, and particularly in the latter part of the prophecy."

JOHANNÆUS, FINNUS. [JONSSON, FINN.]

JOHANNOT, CHARLES-HENRI-ALFRED, was born in 1800 at Offenbach, in Hesse-Darmstadt, of a family of French refugees who had settled in Germany after the revocation of the edict of Nantes. He commenced his professional life as an engraver, in which art he practised for some time with a fair share of success. As a painter he first attracted notice in 1831, when he exhibited the 'Naufrage de Don Juan' and 'Cinq Mara.' Other pictures followed, some of which obtained places at Versailles and other royal and public galleries, he having attracted the notice of Louis Philippe, by whom he was employed to paint various court and ceremonial pieces; but he found time to paint also several pictures from older French history, as 'Francis I. et Charles Quint;' 'Henri II. et Catherine de Medicis,' &c. It was however, as a designer of vignettes, that Alfred Johannot acquired his greatest celebrity; and his popularity in this branch of art was steadily increasing up to the time of his premature death, December 7, 1837. To the English reader Alfred Johannot is perhaps best known by his very clever designs for the French illustrated editions of Scott, Byron, and Cooper.

JOHANNOT, TONY, born at Offenbach, November 9, 1803, is still better known in England as a designer of book-engravings than his brother Alfred. Like his brother, Tony also commenced his professional career as an engraver. His first painting was exhibited at the Exposition of 1831, 'Un Soldat buvant à la porte d'une Hôtellerie.' Like his brother he looked to English as well as French history and literature for subjects for his pencil. Among his chief pictures are enumerated the 'Chanson de Douglas' (1836); 'La Sieste' (1841); 'André et Valentine' (1844); 'Bataille de Fontenoy,' now at Versailles; 'Petits Braconniers' (1848); and 'Scène de Pillage' (1851). Though on the whole less successful than his brother as a painter, when, like him, he turned to designing for the wood-engraver, he proved at least equally happy; and as his life was more prolonged, he enjoyed greater opportunities of displaying the versatility of his pencil. Among the more important of his book illustrations may be mentioned 'Werther,' the designs for which he etched himself; 'Molière's works;' 'Manon Lescaut;' 'Jérôme Paturot;' the Romances of George Sand; the 'Vicar of Wakefield;' Sterne's 'Sentimental Journey,' &c. His illustrations, though not unfrequently a little exaggerated, and sometimes verging on caricature, are almost always characteristic, and full of knowledge and refinement, rendering the works he illustrated among the very best examples of their class. He died suddenly from an attack of apoplexy, August 4, 1852.

JOHN, King of England, surnamed Santerre, or Lackland, a common appellation of younger sons whose age prevented them from holding fiefs, was the youngest of the five sons of Henry II. by his queen Eleanor of Guienne, and was born in the King's Manor House at Oxford, 24th of December 1166. In his youth he was created by his father Earl of Montague in Normandy; and in 1176 he was contracted in marriage to Johanna, or Hadwisa, the youngest daughter of William earl of Gloucester (son of the great Earl Robert, natural son of Henry I.), who thereupon made Johanna his sole heir. The marriage was actually celebrated on the 29th of August 1189. Henry, having after his conquest of Ireland obtained a bull from the pope authorising him to invest any one of his sons with the lordship of that country, conferred the dignity upon John in a great council held at Oxford in 1178. In March 1185 John went over to take into his own hands the government of his dominions; but the insolent demeanour of the prince and his attendants so disgusted and irritated the Irish of all classes, that his father found it necessary to recall him in the following December. John however was his father's favourite son, in part perhaps from the circumstance that his youth had prevented him from joining in any of the repeated rebellions of his brothers; and it is said, that a suspicion began to be at last entertained by Richard, when, of the five brothers, he and John alone survived, that Henry intended to settle the crown of England upon the latter. According to this story, it was chiefly to prevent such an arrangement that Richard, joining Philip of France, flew to arms in January 1193; but if so, it is difficult to account for the fact that John himself was found to be upon this

occasion in confederacy with his elder brother, a discovery which was only made by their heart-broken father upon his deathbed. [HENRY II.]

No opposition was offered by John to the accession of Richard, who endeavoured to attach him by the gift of such honours and possessions as amounted almost to sharing the kingdom with him. In addition to his Norman earldom of Montague, and that of Gloucester, which he acquired by his marriage, those of Cornwall, Dorset, Somerset, Nottingham, Derby, and Lancaster were bestowed upon him, so that there was thus placed under his immediate jurisdiction nearly a third of England. Richard however had not been long absent when his ambitious brother proceeded to take his measures for at least securing the crown to himself in case of the king's death, if not for an earlier seizure of it. The person next in the regular line of succession was Arthur, duke of Brittany, the son of John's elder brother Geoffrey, an infant of little more than two years old at the accession of Richard, who however recognised him as his heir, and had desired that his rights should be maintained by William de Longchamp, the bishop of Ely, whom during his absence he left in charge of the government. John accordingly directed his first efforts to the removal of the bishop, which, having obtained the co-operation of a strong party of the barons, he at length accomplished by actual force, in October 1191. When the intelligence of Richard's captivity arrived in 1193, John at once openly took steps for the immediate usurpation of the throne. Repairing in haste to Paris, he secured the aid of Philip Augustus by the surrender of part of Normandy, and then, returning to England, proceeded to collect an army for the maintenance of his pretensions. In this attempt however he was successfully resisted by the loyal part of the nobility; and he also failed in his endeavours to induce the emperor, by the promise of a large bribe, to retain his brother in prison. On the return of Richard to England, in March 1194, John's castles and estates were seized by the crown, and he and his chief adviser, Hugh, bishop of Coventry, were charged with high treason. John fled to Normandy, whither he was followed by the king at the head of an army; but the traitor made his peace by an abject submission, and, his mother seconding his supplications for pardon, he was allowed to retain his life and his liberty, and even restored to some measure of favour, though the restitution of his castles and territorial possessions was for a time firmly refused. Even that however was at length granted to his importunities and those of his mother; and it is further said, that Richard, when on his deathbed, was induced to declare John his successor.

John was present when Richard expired at Chaluz, 6th of April 1199, and before visiting England he hastened to secure the submission of the various continental territories of the crown. Upon repairing to Anjou and the other original possessions of the Plantagenets, he found the prevalent feeling strongly in favour of his nephew Arthur; but both in Normandy, and also in Poitou and Aquitaine, where his mother's influence was predominant, his pretensions were readily acknowledged. Meanwhile in England, by the activity of the justiciary Fitz-Peter, a unanimous resolution to receive him as king had been obtained from a great council held at Northampton. Soon after this John made his appearance in person; and he was solemnly crowned at Westminster, on the 26th of May, the festival of the Ascension. The years of his reign are reckoned from Ascension-day to Ascension-day.

Philip Augustus having, for his own purposes, espoused the cause of Arthur, whom he had got into his possession, soon overran both Normandy and Anjou; but in May 1200, John purchased a peace by a heavy pecuniary payment and the cession of several towns and other territories to the French king, who on his part relinquished such of his conquests as were not thus permanently made over to him, and also compelled Arthur to do homage to his uncle for Brittany. The next year John, having become tired of his wife, or never having been attached to her, procured a divorce on the plea of consanguinity, and married Isabella, daughter of Aymer count of Angoulême, who had already been betrothed, and even privately espoused, to Hugh count of La Marche. The complaints of the count in consequence of this injury gave Philip such a pretence as he wanted for renewing the war: he immediately took Arthur again by the hand, and putting him forward as the legitimate lord of the old fiefs of the Plantagenets, rapidly obtained possession of all the most important towns and places of strength in those countries. Arthur however, while he was besieging the castle of Mirabeau in Poitou, which was held by John's mother, Queen Eleanor, was taken captive by his uncle (1st of August 1202): the unfortunate young prince was immediately consigned to close custody in the castle of Falaise, from which he was soon after removed to Rouen, and having never been seen more, was universally believed to have been there put out of existence by his uncle's order. Indeed, it was generally said that he had been murdered by John's own hand, an imputation which the latter never took the trouble to deny. Arthur's sister Eleanor, to whom devolved his claim to the inheritance of the English crown, was carried over to England, and confined in the castle of Bristol, in which prison she remained till her death in 1241. Notwithstanding the capture of Arthur however the war in France went wholly against John; and before the end of the year 1204 Normandy, Anjou, Maine, and Touraine were rent from the crown of England, and re-annexed to that of France, from which they had been separated for nearly three centuries. Two years after-

wards John made an unsuccessful attempt to recover what he had thus lost.

While still at war with France, John became involved in another contest at home, which was eventually attended with still more fatal results. By insisting upon the right of the crown to nominate the Archbishop of Canterbury, on that see becoming vacant in July 1205, he drew upon himself the formidable hostility of the whole body of the national clergy, and also of the able and imperious pontiff who then presided over the Western Church. [INNOCENT III.] John paid little regard either to the interdict under which his kingdom was laid in 1208, or to the bull of excommunication issued against him the following year, or even to that deposing him and absolving his subjects from their allegiance, which Innocent launched at him in 1212. In the midst of all this ecclesiastical thunder he chastised the Scottish king William, compelling him, in 1209, to avert further hostilities by the payment of a large sum of money, and the delivery of his two daughters, with other hostages, as pledges for his observance of his engagements; he passed over to Ireland in 1210, and reduced a rebellion of the English chieftains there; and in 1212 he marched into Wales, and compelled Llewellyn, the prince of that country, to make his submission. In the last-mentioned year he also put down a confederacy of certain of his barons, which had been formed with the object of seizing his person.

At last however Innocent had recourse to more effective arms than his apostolic artillery. At the instigation of the pope, Philip Augustus prepared to invade England; and though John at first attempted to meet this threatening danger with some spirit, by conducting an army to France in April 1213, he soon returned home without having done anything; and in the despair produced by the universal hatred in which he found himself to be held by his subjects, whom his lawless and oppressive government had long alienated and disgusted, he consented, at Dover, on the 18th of May 1213, in an interview with Pandulf, the Papal legate, to submit to all the demands of the Holy See, of which the admission of the pope's nominee, Stephen de Langton, to the archbishopric of Canterbury, was the first. Two days after, he made over to the pope the kingdoms of England and Ireland, to be held of him and of the Roman Church in fee, and took to his holiness the ordinary oath taken by vassals to their lords. It was now agreed that there should be an oblivion of the past on both sides, that the bull of excommunication should be revoked by the pope, and that of John's disaffected English subjects those who were in confinement should be liberated, and those who had fled or been banished beyond seas should be permitted to return home. Philip, whose ambition was mortified by this pacification, would have persisted in his project of invasion, even in opposition to the express commands of the pope, but he was compelled to disband his army by the result of a battle fought in June between the English and French fleets, in the harbour of Damme, the first great victory in the naval annals of England, in which 300 of his vessels were captured, above 100 burned, and all his military stores and provisions, as well as his means of conveyance, taken from him.

One effect of this victory however was immediately to beget in John a hope of being able to extricate himself from his late engagement in favour of the exiles and outlaws, and perhaps also from the vassalage in which he had bound himself and his kingdom to the pope. In this view he at first attempted to raise an army with which to invade France, before doing anything in fulfilment of his promises either to the barons or the Church; but finding that the opposition of these united powers was too strong for him, he changed his course of proceeding, and temporized with both, until, by further submissions to the new papal legate, the Cardinal Nicholas, who arrived in England in the end of September, if he did not gain over the national clergy, he at least converted the pope himself, from being the head of the confederacy against him, into his friend and supporter. The primate Langton however, greatly to his honour, still continued to make common cause with the barons. Langton had already, in a meeting held at St. Alban's, August 25, proposed to the barons to rally round the charter of Henry I., and had solemnly sworn them to hazard their lives in the maintenance of the rights and liberties therein recognised. For a short time the commencing strife was appeased by an award of the pope; soon after which, in June 1214, John hastened over to France, where however the great victory of Bouvines, gained by Philip (July 27) over the allied army of the English under John's bastard brother, the earl of Salisbury, the forces of the emperor, of the Earl of Flanders, and of the Earl of Boulogne, compelled the English king to sue for a cessation of hostilities. On the 19th of October a truce was arranged between the two kingdoms, to last for five years. But the depressed state of John's affairs now presented to his barons an opportunity for the renewal of their demands, of which they hastened to avail themselves. Their first memorable assemblage, in which they concerted their plans, was held, under pretence of celebrating the festival of the saint, in the abbey of St. Edmund at Edmondsbury, on the 20th of November. Before they separated, they advanced one by one to the high altar, and laying their hands upon it, took a solemn oath to withdraw their fealty, and levy war upon John, if he should refuse their demands, and never to lay down their arms till they had obtained from him a charter confirming the national liberties. Their petition was formally presented to John in

the Temple, at London, on the feast of the Epiphany, the 6th of January following. On its rejection, both parties, after an appeal to the pope, who at once took the part of John, prepared for war. In the beginning of May 1215, the barons having mustered their forces, which they put under the command of Robert Fitzwalter, and designated by the title of the army of God and of his Holy Church, proceeded to lay siege to the castle of Northampton. After wasting a fortnight however they were obliged to retire from this fortress: but having then marched to London, they were gladly received by the citizens (May 17th), and immediately took possession of the city. On this, John consented to a conference, and the celebrated meeting on the plain of Runnymede, which lay about half-way between London and Odiham in Hampshire, whither John had retired, was held in consequence on Trinity Monday, the 15th of June. The result was, the concession and signature by John of the Great Charter, embodying all the barons' demands.

Scarcely however had Magna Charta been thus extorted, when John set himself to work to endeavour to escape from its obligations. The suspicions excited by his general conduct, and especially by his introduction into the kingdom of numerous bodies of foreign troops, again called up the barons in arms by the following October. At first this new contest ran strongly in favour of the king; William D'Albiny, who, by the direction of the insurgent leaders, had thrown himself into the castle of Rochester, was, after sustaining a siege of seven weeks, compelled to surrender at discretion: news soon after arrived that the pope, as requested by John, had annulled the charter; this intelligence was followed by other papal bulls suspending Archbishop Langton, excommunicating the chiefs of the barons by name, and laying the city of London under an interdict; and John was soon enabled to wreak his vengeance on his enemies almost without encountering any resistance. While one part of his army, under the command of the Earl of Salisbury, wasted the counties around the metropolis, where the chief strength of the barons lay, he himself, with another force, proceeded to the north, where he drove back their ally, Alexander, the young king of Scotland, pursuing him as far as Edinburgh, and reducing to ashes every town, village, and castle, on both sides of the border, that fell within the range of his furious progress. In these disastrous circumstances, the barons congregated in London resolved, after much debate, upon the desperate expedient of offering the crown to Louis, the dauphin of France, as the only chance left to them of preserving any part of the national liberties. Accepting the invitation, Louis set sail from Calais with a fleet of 680 sail, and on the 30th of May 1216 landed at Sandwich. John retired to the west at his approach, and the French prince, after attacking and easily reducing the castle of Rochester, immediately marched to the capital. The fortune of the contest now turned. The people in all parts of the country eagerly rallied around Louis; even his foreign auxiliaries, most of whom were Frenchmen, began to quit the standard of the English king, and either to join that of the invader or to return home. At this critical moment arrived the news of the death of John's powerful friend Pope Innocent III., (16th July). Still however most of the places of strength were in his hands; and some months were spent to little purpose by the adverse party in attempts to reduce Dover, Windsor, and other castles which were occupied by his garrisons. Meanwhile, in the disappointment produced by the protraction of the war, jealousy of their foreign allies was beginning to spread among the insurgents; and it is very doubtful what the issue of the struggle might have been if the life of John had been prolonged. But on the 14th of October, as he was attempting to ford the Wash at low-water, from Cross-keys to the Foss-dyke, and had already got across himself with the greater part of his army, the return of the tide suddenly swept away the carriages and horses that conveyed all his baggage and treasures; on which, in an agony of vexation, he proceeded to the Cistercian convent of Swineshead, and was that same night seized with a violent fever, the consequence probably of irritation and fatigue, but which one account attributes to an imprudent indulgence at supper in fruit and new cider; another to poison administered to him by one of the monks. Although very ill, he was conveyed the next day in a litter to the castle of Sleaford, and thence on the 16th to the castle of Newark, where he expired on the 18th, in the forty-ninth year of his age, and the seventeenth of his reign.

All our historians paint the character of John in the darkest colours; and the history of his reign seems to prove that to his full share of the ferocity of his race he conjoined an unsteadiness and volatility, a susceptibility of being suddenly depressed by evil fortune and elated beyond the bounds of moderation and prudence by its opposite, which give a littleness to his character not belonging to that of any of his royal ancestors. He is charged in addition with a savage cruelty of disposition, and with the most unbounded licentiousness: while on the other hand so many vices are not allowed to have been relieved by a single good quality. It ought to be remembered however that John has had no historian; his cause expired with himself, and every writer of his story has told it in the spirit of the opposite and victorious party; and further, that the intense disgust always felt by every class of his countrymen at his base surrender of his kingdom in vassalage to the pope, may have led them to regard with less distrust all adverse reports respecting his general character.

The children of John by his queen Isabella of Angoulême were—

1, Henry, who succeeded him as Henry III.; 2, Richard, born January 5, 1208, created Earl of Cornwall 1226, elected King of the Romans 1257, died 2nd April 1272; 3, Joan, married June 25, 1221, to Alexander II. of Scotland, died March 4, 1238; 4, Eleanor, married, first, 1235, to William Marshall, earl of Pembroke, secondly, 1238, to Simon Montfort, earl of Leicester; and 5, Isabella, born 1214, married 20th July 1235, to Frederic II., emperor of Germany, died 1st December 1241. Several natural children are also assigned to him, none of whose names however make any figure in our history.

JOHN I., a native of Tuscany, succeeded Hormisdas in the see of Rome, in 523. He was employed by King Theodoric on a mission to the Emperor Justin of Constantinople; but after his return, from some unknown cause, he incurred the displeasure of Theodoric, and was put in prison, where he died in 526.

JOHN II. succeeded Boniface II. in 532, being elected by the clergy and the people of Rome, and confirmed by King Athalaric, for which confirmation a certain payment was fixed by an edict of the same king. He died in 535.

JOHN III., a native of Rome, was elected to succeed Pelagius I. in 560, and was confirmed by the exarch of Ravenna in the name of the Emperor Justinian. Two French bishops, of Embrun and of Gap, having been deposed by local councils, appealed to John, who ordered their restoration, which Gontram, the Burgundian king, enforced in opposition to the French clergy, who asserted their independence of the Roman see. John died in 574.

JOHN IV., a native of Dalmatia, succeeded Severinus in 640. He condemned the heresy of the Monothelites [ΕΥΤΥΧΙΣΜΟΣ], and died in 642.

JOHN V., a native of Syria, succeeded Benedict II. in 686, and died after a few months.

JOHN VI., a native of Greece, succeeded Sergius I. in 702. In a council which he held at Rome he acquitted Wilfred, archbishop of York, of several charges brought against him by the English clergy. He died in 705.

JOHN VII., also a Greek, succeeded John VI., and died in 707.

JOHN VIII., who has been styled the IX. by those who believed in the story of Pope Joan, whom they style John VIII. [JOAN, POPE], succeeded Adrian II. in 872. He crowned Charles the Bald emperor, and after him also Charles the Fat. He confirmed the exaltation of Photius to the see of Constantinople. He had disputes with the marquises of Tuscany and the dukes of Spoleto, and died in 882, after a busy pontificate.

JOHN IX. was elected in 898, held two councils at Rome and Ravenna, and died about the year 900.

JOHN X. succeeded Lando in 915. He crowned Berengarius as king of Italy and emperor. The Saracens from Africa, who had landed in Italy and fortified themselves near the banks of the Liris, made frequent irruptions into the Roman territory. John, united with Berengarius and the dukes of Benevento and Naples, marched in person against them, and completely routed and exterminated them. The famous Marozia, a Roman lady of very loose conduct, and her husband, Guido, duke of Tuscany, ruled at Rome by force and intrigue. John, having had repeated disputes with them, was at length seized by their satellites in his palace of the Lateran, and thrown into prison, where he was put to death, according to report, in 927.

JOHN XI., son of Marozia, succeeded Stephen VIII. in 931. His brother Alberico headed a revolt of the Romans against his mother, who was secured in prison, and her new husband King Hugo was driven away from the city. John himself was closely watched by his brother, and died in the year 936, not without suspicion of violence.

JOHN XII., originally called Octavianus, son of Alberico and grandson of Marozia, succeeded Agapitus in 956, while he was only in his nineteenth year. In 960 he crowned at Rome Otho I. of Germany as emperor and king of Italy. But some time after the complaints against his licentious conduct became so loud, that the emperor returned to Rome, and there in an assembly of the clergy caused John to be deposed and Leo VIII. to be elected in his stead, in 963. In the following year however John re-entered Rome at the head of numerous partisans, drove out Leo, and committed many acts of cruelty. Otho, who was then in the north of Italy, was preparing to return to Rome at the head of his troops, when John fell suddenly ill, and died in 964. Panvinus, in a note to Platina's account of Pope Joan, suggests that the licentiousness of John XII., who among his numerous mistresses had one called Joan who exercised the chief influence at Rome during his pontificate, may have given rise to the story of 'Pope Joan.'

JOHN XIII., Bishop of Narni, succeeded Benedict V. in 965, with the approbation of the emperor Otho, but soon after the Romans revolted and imprisoned John. Otho however marched to Rome, reinstated John, and hanged thirteen of the leaders of the revolt. John crowned at Rome Otho II., son and successor of Otho I., and died in 972.

JOHN XIV., Bishop of Pavia and chancellor to Otho II., succeeded Benedict VII. in the see of Rome in 983. Boniface VII., an intruder, entered Rome soon after, and put John in prison, where he died of violence, after a pontificate of only nine months.

JOHN XV. (styled XVI. by some who place before him another John, who is said to have lived only a few days after his election)

was elected in 985. The disturbances of the patrician or consul Crescentius began in his pontificate. John however remained at Rome, and kept on good terms with Crescentius. He died in 996.

JOHN XVII., a Calabrian and Bishop of Piacenza, was appointed Pope in 997 by Crescentius, in opposition to Gregory V., but Otho III. came to Rome, imprisoned and mutilated John, and put to death Crescentius and his partisans. [GREGORY V.] John however is generally numbered in the series of the Popes.

JOHN XVIII. succeeded Sylvester II. in 1003, and died four months after his election.

JOHN XIX. succeeded the preceding, and died about 1009. The history of the popes during this period is very obscure, and the chronology confused.

JOHN XX., son of Count Gregory of Tuscany, succeeded his brother Benedict VIII. in the year 1024. He crowned the Emperor Conrad, and died in 1034.

JOHN XXI., a native of Lisbon, succeeded Adrian V. in 1277, and died about three months after.

JOHN XXII., James of Cahors in France, succeeded Clement V. in 1316, and, like him, took up his residence at Avignon. He was a man of considerable abilities, but he has been taxed with avarice and worldliness. The crown of Germany was then contested between Louis of Bavaria and Frederick of Austria, and John, assuming the right of deciding, excommunicated Louis. But this measure produced little effect in Germany; the diet of Frankfurt declared that the imperial authority depended upon God alone, and that the pope had no temporal authority, direct or indirect, within the empire. In Italy however John met with greater success; his ally, Robert, king of Naples, defeated the Ghibelines, and the pope excommunicated Matteo Visconti, the great leader of that party, and likewise Frederick, king of Sicily. Between Guelphs and Ghibelines, Italy was at that time in a dreadful state of confusion. The pope preached a crusade against Visconti, Cane della Scala, and the Este, as heretics. Robert, with the assistance of the pope, aspired to the dominion of all Italy, and the pope sent a legate, who, at the head of an army, assisted Robert and the other Guelphs against the Ghibelines of Lombardy. But the Ghibelines had clever leaders; Castruccio Castracani, Cane della Scala, and the Visconti kept the fate of the war in suspense, and Louis of Bavaria sent troops to their assistance. Louis came himself to Italy in 1327, and after being crowned at Milan with the iron crown, he proceeded to Rome, where the Colonna and other Ghibelines roused the people in his favour, and drove away the papal legate. Louis was crowned emperor in St. Peter's by the bishops of Venice and of Aleria, after which he held an assembly in the square before the church, in which he summoned James of Cahors (meaning the pope) to appear to answer the charges of heresy and high treason against him. After this mock citation, the emperor proceeded to depose the pope and to appoint in his stead Peter de Corvara, a monk of Abruzzo, who assumed the name of Nicholas V. Louis also proclaimed a law, which was sanctioned by the people of Rome, to the effect that the pope should reside at Rome, and if absent for more than three months, should be considered as deposed. Louis now returned to the north of Italy, and thence to Germany. Castruccio and Cane della Scala died, and the Guelphs and the papal legate began to resume the preponderance. In 1334 John XXII. died at Avignon, leaving the affairs of Italy as embroiled as ever, and eighteen millions of golden florins in his coffers, besides jewels. It was under his pontificate that the clergy and people of the towns were deprived of the right of electing their bishops, which right he reserved to himself, on payment of certain fees by the person elected. He was also the inventor of the Annates, or First Fruits.

JOHN XXIII., Cardinal Cossa, succeeded Alexander V. in 1410. He supported the claims of Louis of Anjou against Ladislaus, king of Naples; but Ladislaus, having defeated his rival in battle, advanced to Rome, and obliged the pope to escape to Florence. John preached a crusade against Ladislaus, which gave occasion to denunciations and invectives from John Huss. Meantime the great schism continued, and Gregory, styled XII., and Benedict, antipope, divided with John the homage of the Christian states. John, in his exile, wishing to secure the favour of the Emperor Sigismund, proposed to him the convocation of a general council to restore peace to the church, and Sigismund fixed on the city of Constance as the place of assembly. On hearing of the death of Ladislaus, by which event Rome became again open to him, John repented of what he had proposed, but was obliged to comply with the general wish by repairing to Constance. The fathers of the council decided that John, as well as his two rivals, should renounce their claims to the papacy as the only means of restoring peace. John signed the form of renunciation, but soon after, by the assistance of Frederick of Austria, he was conveyed out of the city, and resumed his authority by ordering the council to dissolve. But the council, in its fourth and fifth sessions, decided by a solemn decree that the general council once assembled is superior to the pope, and can receive no orders from him. A formal process being instituted against John, sixty charges were laid against him, of which only part were made public. Witnesses being heard, a solemn deposition was pronounced on the 29th of May 1415, to which John submitted, and was then given into the custody of the elector palatine. After the election of Martin V. and the termination of the

council of Constance, John, now again Balthazar Cossa, escaped from Germany, and made his submission to the new pope, who treated him kindly and gave him the first rank among the cardinals. He died soon after.

JOHN OF GAUNT. [EDWARD III.; HENRY IV.]

JOHN HYRCANUS. [HYRCANUS.]

JOHN, or JOAM, KINGS OF PORTUGAL. [PORTUGAL, in GEOGRAPHICAL DIV. OF ENG. CYC.]

JOHN, KINGS OF SPAIN. [JUAN.]

JOHN, KING OF SWEDEN. [CHARLES XIV.]

JOHN, SAINT, THE APOSTLE AND EVANGELIST. Among the persons who at the commencement of his ministry joined themselves to our Saviour were two brothers, named James and John, the sons of Zebedee. They were both admitted by him into the number of his Twelve Apostles, and John was throughout distinguished by him with peculiar marks of regard. He speaks of himself, in the account which he left of the ministry of Jesus, as the disciple whom Jesus loved; and whenever a very few only of the apostles were to be employed by Jesus, or to accompany him, John was always one of the number, James and Peter being usually the others.

At the Last Supper we find him leaning on the bosom of Jesus. He attended Jesus in the garden and in the hall of the high-priest. He accompanied him to Calvary, and when Jesus was hanging on the cross John drew near, and while the miraculous darkness struck fear into the hearts of those who were employed in the work of death, he entered into conversation with Jesus, who commended to him the care of his mother Mary. This dying request of our Lord the apostle seems to have regarded as a sacred injunction, for he took her from that time to his own house.

After the resurrection of Jesus he was again distinguished by his notice; and when Jesus had ascended to heaven, and the interests of the Gospel were committed especially to those who had been chosen by him out of the world, John became one of the leading persons in the Church; acting in concert with the other apostles, and especially Peter and James, till the history in the 'Acts of the Apostles' ceases to notice what was done by the other apostles, and is confined to the travels and labours of Saint Paul.

Saint John's labours in the Church were chiefly among the inhabitants of Syria and Asia Minor, and no doubt he had a large share in planting Christianity in those provinces, where for a time it flourished greatly; but Christian antiquity does not present to us many particulars of the labours of the apostles, and we learn from it respecting John little more on which dependence may be safely placed than that he resided at Ephesus in the latter part of his life, and died in extreme old age.

Two pleasing stories are related of him by early Christian writers deserving of regard: one that, when too feeble to do more, he was wont to be carried into the assemblies of Christians at Ephesus, saying, as he went along, "My little children, love one another." The other respects his conduct to a young man who had joined a party of banditti. But when we read in those writers that he was thrown into a cauldron of boiling oil, and came out unhurt, distrust arises, and we question the sufficiency of the evidence. There is however little reason to doubt that he was at one period of his life banished to the island of Patmos, and that there he wrote the book called the 'Apocalypse,' or 'Revelation.'

There are also preserved three epistles of his: but the most valuable of his writings which have descended to our time is the 'Gospel according to Saint John.' This Gospel is unlike the other three in several respects, and is supposed by those who have considered it to have been written with some especial purpose, either as a kind of supplement to the other evangelists, which was the opinion of Eusebius, or with a view to the refutation of certain erroneous notions respecting our Saviour which had begun to prevail before the long life of Saint John was brought to a close: but with whatever design it was composed it must ever be regarded as amongst the most valuable testimonies to the life, character, and doctrine of Jesus.

JOHN, SAINT, THE BAPTIST, son of Zachariah, a Jewish priest, and Elizabeth his wife, who was a near relative of Mary, the mother of Jesus Christ, was born to them in their old age. The sacred office was assigned to him of being the precursor or herald of the Messiah. The history of the public ministry of Jesus begins with the acts of John the Baptist, whom we find withdrawing himself from the ordinary affairs of life and retiring to the desert country watered by the Jordan, where he preached in a fearless manner against the vices of the age, urged an immediate repentance, enforcing his exhortations by the announcement that the Kingdom of Heaven was at hand, and requiring of those who professed to receive him as their instructor that they should submit to the rite of baptism.

Amongst those who came to him and were baptised by him was Jesus Christ, who at his baptism was announced, both by the Baptist himself and by a voice from heaven, to be the Son of God, the Messiah.

From this time we hear little more of John till we find him in prison. He had ventured publicly to reprove Herod the king for an act of great immorality. Herod had married Herodias, who was the wife of Philip, tetrarch of Idumæa, his own brother. The Baptist's reproof was resented more violently by Herodias than by Herod. The history is related by the evangelists with all particulars. Salome, the daughter

of Herodias, had so pleased Herod with her dancing at a public entertainment given by him, that he in an oriental affluence of professed obligation said publicly, that he would give her whatever she would ask, even to the half of his kingdom. The little girl, for she was then extremely young, instructed by her wicked mother, asked the head of John the Baptist. Persons were immediately sent to the prison in which John was confined, who beheaded him, and delivered the head to the young princess, who carried it in a dish to her mother.

JOHN OF SALISBURY finds a place, and very deservedly, in every catalogue of learned Englishmen. His era was the reign of King Henry II., the Salisbury from which he took his name was therefore the old town of that name (Old Sarum), and not the present episcopal city, which was not founded till the reign of Henry III. John had studied at Oxford, but he visited also the universities of France and Italy. According to Leland, he was intimately acquainted with the Latin and Greek writers; he had some knowledge of Hebrew; he was skilled in the mathematics and every branch of natural philosophy, as he was also in theology and morals; he was an eloquent orator and an eminent poet. Leland further says of him that he was possessed of the most amiable disposition, ever cheerful, innocent, and good.

John was much connected with Thomas à Becket, archbishop of Canterbury. Peter of Blois, in the twenty-second of his 'Epistles,' which are collected and printed, calls John the eye and hand of the archbishop. John became himself the Bishop of Chartres in 1164. He died in 1182.

John's principal historical writings were 'Lives of Two Archbishops of Canterbury, Anselm and Thomas à Becket.' But the work by which he is best known to scholars, for the curious matter which it contains can scarcely be said to have found its way into the vernacular literature of his own or any other country, is entitled 'Polycricon, de Nugis Curialibus et Vestigiis Philosophorum,' in which he describes the manners of the great, speaking not unfrequently in the style of sharp satire. There is an edition of it at Paris (1618), and another at London (1695). A large catalogue of his writings may be seen in Pitz and other writers of that class. See also Tanner, 'Bib. Brit. Hib.'

JOHNSON, SAMUEL, the son of Michael Johnson, a bookseller at Lichfield, and Sarah, his wife, was born at Lichfield on the 18th of September 1709. As a child he was afflicted with the king's evil, which disfigured his face and impaired his eyesight, and he was taken to Queen Anne to be touched. His education was commenced at Lichfield, whence he was removed to a school at Stourbridge; and in 1728, two years after he had left Stourbridge, he was placed at Pembroke College, Oxford. Young Johnson had early shown a vigorous understanding and an eagerness for knowledge: though he had poverty to contend with and a natural indolence, and was also subject to constitutional infirmity, and periodical attacks of morbid melancholy, he acquired a large fund of information at the university. Necessity compelled him to abandon the hope of taking a degree; his debts, though small, were increasing; remittances from Lichfield could no longer be supplied; and he quitted college and returned to his father's house. In the December following (1731) his father died in such pecuniary distress, that Johnson was soon afterwards glad to become usher of a school at Market Bosworth in Leicestershire, to which it appears from his diary that he went on foot: "Julii 16," he writes, "Bosworthiam pedes petii." But finding the drudgery of this employment intolerable, he sought other means of obtaining his bread, and procured temporary employment in translating for a bookseller in Birmingham. During his residence in this town he became intimate with the family of a mercer named Porter, whose widow he subsequently married (1736). Mrs. Porter was more than twenty years older than himself, but he was fondly attached to her, and she added to other powers of increasing his happiness the possession of 800*l*. With this capital he established a school, but his advertisements produced few scholars, the scheme failed, and he left Staffordshire with his pupil Garrick to seek his fortune in the metropolis.

His prospects at this time must have been very gloomy: he had nothing but literature to trust to for subsistence, and those were times when the condition of literary men was most miserable and degraded. In the reigns of William, of Anne, and George I., successful writers were rewarded by private munificence and public situations; but such patronage was now at an end, and the year in which Johnson left his home formed part of an interval which elapsed before a new source of remuneration arose—before the number of readers became large. Of readers there were still but few; the prices therefore that booksellers could afford to pay to authors were necessarily small; and an author, whatever were his talents or his industry, had great difficulty in keeping a shilling in his purse. The poverty and neglected condition of his friend and brother author, Savage, were the causes of Johnson's writing his 'London,' an imitation of the third satire of Juvenal, for which Mr. Dodsley gave him ten guineas, and by which he obtained a certain degree of reputation. We are told that when Pope read it he said, "The author, whoever he is, will not be long concealed." No great advantage however immediately accrued to him. Again he sought to be a schoolmaster, again his scheme miscarried, and he returned to his drudgery in the service of Cave the bookseller, who was his only patron. His pen was continually at work, and his pamphlets, prefaces, epigrams, essays, and biographical memoirs, were continually published by Cave, either by themselves or in his periodical

the 'Gentleman's Magazine.' For many years his bread continued to be earned by literary slavery; by slow degrees only did his great talents become known, and the trust reposed in him by publishers increase.

In 1740, and for more than two years afterwards, Johnson wrote the parliamentary speeches in the 'Gentleman's Magazine.' In 1744 he published his 'Life of Savage;' in the following year some observations on Shakspeare, whose plays he proposed to edit; and in 1747 he commenced his 'English Dictionary,' which he engaged to complete in three years for 1575*l.*, a small sum if we consider that the author agreed to bear the heavy expenses necessary for preparing a work of such magnitude and importance. In 1749 appeared 'The Vanity of Human Wishes,' an imitation of the tenth satire of Juvenal; and in the following year was printed the first paper of the 'Rambler.' These are some of his most remarkable publications, for a complete list of which, and the dates at which they were published, we must refer to Boswell's 'Life.' For 'The Vanity of Human Wishes' 15 guineas only were received from Mr. Dodsley. We mention this because the frame and condition of Johnson's mind and temper, his views of things and persons, were probably influenced in no small degree by the deficiency of his means. He was now engaged in a steady course of occupation sufficient to employ his time for several years; and so assiduous were his labours that, whilst preparing his 'Dictionary,' he had an upper room at his residence in Gough Square fitted up like a counting-house, in which several copyists sat, whom he supplied with continual employment.

The efforts of his mind were the utmost it could bear; and when it was subdued by grief at the death of his wife (1752), he relinquished the 'Rambler.' Bad as his circumstances were, still they were somewhat more easy than they had been; the number of his acquaintances had increased; the 'Dictionary,' which occupied eight instead of the promised three years, was nearly complete; and he found leisure (in 1754) to make an excursion to Oxford for the purpose of consulting its libraries. This was his first emancipation from necessary labour. He soon returned to London to increase the number of reviews and essays which flowed continually from his pen. Thus occupied, an offer of a living was made to him if he would take orders; but though he was a firm believer in revelation, and a somewhat rigid moralist, he could not overcome his scruples respecting the fitness of his temper and habits for the duties that would be required of him, and the offer was rejected. He continued therefore to write for his bread; and it was not until he was fifty-three years old, and had for thirty years been toiling with his pen, that any certain source of income was opened to him. In May 1762 George III., through his minister Lord Bute, granted Johnson a pension of 300*l.* a year, and the days of his penury were at an end. Happy, in a state of independence, he enjoyed the society of a weekly club, of which Burke, Goldsmith, and Sir Joshua Reynolds were also members. He was introduced in the following year to his biographer Boswell, and we have from this date (1763) as full and minute account of him as has ever been written of any individual. From this time we are made as familiar as it is in the power of writing to make us with the character, the habits, and the appearance of Johnson, and the persons and things with which he was connected. "Everything about him," says Macaulay, "his coat, his wig, his figure, his face, his scrofula, his St. Vitus's dance, his rolling walk, his blinking eye, the outward signs which too clearly marked the approbation of his dinner, his insatiable appetite for fish-sauce and veal-pie with plums, his inextinguishable thirst for tea, his trick of touching the posts as he walked, his mysterious practice of treasuring up scraps of orange-peel, his morning slumbers, his midnight disputations, his contortions, his mutterings, his gruntings, his puffings; his vigorous, acute, and ready eloquence; his sarcastic wit, his vehemence, his insolence, his fits of tempestuous rage, his queer inmates—old Mr. Levett and blind Mrs. Williams, the cat Hodge and the negro Frank—all are as familiar to us as the objects by which we have been surrounded from childhood."

In 1765 the university of Dublin sent over a diploma creating him a doctor of laws, but he did not assume the title of doctor until eight or ten years afterwards, when the university of Oxford conferred the same honour upon him.

In 1766 his constitution seemed to be rapidly giving way, and he was depressed with a melancholy. In this condition his friend Mr. Thrale received him into his house at Streatham; an apartment was fitted up for him, companions were invited from London, and he became a constant resident in the family. His celebrity attracted the notice of the king, to whom he was introduced by the librarian of Buckingham House. We are not told that politics had in any way led to this introduction, but it is not impossible that the opinions that Johnson entertained upon the principal questions of the day might have reached the king's ears. For several years he occasionally published political pamphlets. In the autumn of 1773 he made a tour, in company with Mr. Boswell, to the Western Islands of Scotland, of which he published an account. Two years afterwards he made a short excursion to Paris. The last of his literary labours was 'The Lives of the Poets,' which were completed in 1781. We now take leave of him as an author, and have only to record the few domestic occurrences which took place before the close of his long life. These are for the most part melancholy. His friends Mr. Thrale and Mrs.

Williams preceded him to the grave. In June 1783 he had a paralytic stroke, and in the following November was greatly swollen with the dropsy. During a journey to Derbyshire he felt a temporary relief; but in 1784 he suffered both from dropsy and from asthma. His diseases were evidently irremediable; and the thought of death increased his constitutional melancholy. On Monday the 18th of December 1784 he expired in his house in Bolt Court; on the 20th of the month his remains with due solemnity and a numerous attendance of his friends were buried in Westminster Abbey, near the foot of Shakspeare's monument, and close to the grave of Garrick.

Whether in the deepest poverty or in comparative affluence, Johnson displayed great independence of character; and his Tory opinions are to be attributed to disinterested conviction, and were in harmony with his general spirit. He was steady and inflexible in maintaining the obligations of religion, a sincere and zealous Christian, and, as such, benevolent. But besides these great qualities he possessed others of marked littleness. In many respects he seemed a different person at different times. He was intolerant of particular principles; superstitious; and his mind was at an early period narrowed upon many questions religious and political. He was open to flattery, hard to please, easy to offend, impetuous and irritable. These were the principal blotches upon his character, but his great qualities predominated, and he has left far more to admire and revere than to censure and condemn.

His reasoning was sound, dexterous, and acute; he was seldom imposed upon either by fallacies or exaggerated statements; his perception was quick; his thoughts were striking and original, and his imagination vivid. In conversation his style was keen and pointed, and his language appropriate; he had also a remarkable facility of illustration from familiar objects. His wit may be described as logical, and chiefly consisted in dexterously convicting his opponent of absurdity. Conscious of his power, he was fond of dispute, and used to argue for victory. Scarcely any of his contemporaries except Burke was a match for him in such discussions. His written style was eminently periodic; and in order to construct every sentence into a balanced period he frequently introduced superfluous and high-sounding expressions; hence his general style was pompous, heavy, and diffuse; but in his later works, as the 'Lives of the Poets,' these faults become much less visible, and particular passages might be selected of almost unmatched excellence. He was also fond of words of Latin derivation, to the exclusion of words of more familiar Saxon origin. His style has often been imitated, and sometimes burlesqued; but both imitations and burlesques are almost invariably ludicrous failures: as an example of what puerile absurdity even clever writers can bring themselves to believe is an allowable burlesque on Johnson's style we may refer to that in the 'Rejected Addresses.'

Johnson's strong and penetrating intellect did not fit him for poetry, except of the satirical order. His 'Irene' is deservedly forgotten; but his 'London: an imitation of the Third Satire of Juvenal,' contains nervous thoughts expressed in harmonious verse; and his 'Vanity of Human Wishes, being the Tenth Satire of Juvenal Imitated,' is a fine poetical declamation, though deformed by occasional tautology: it has had the rare fortune of receiving the highest eulogies from two great recent poets of a school wholly different to that of Johnson—Byron and Scott; the latter of whom says of it, "The deep and pathetic morality of 'The Vanity of Human Wishes' has often extracted tears from those whose eyes wander dry over pages professedly sentimental;" while Byron wrote, "'Tis a grand poem . . . all the examples and mode of giving them sublime." Among his smaller pieces the two most remarkable are his verses on the opening of Drury Lane Theatre in 1747, and the stanzas on the death of Mr. Levett. His tale of 'Rasselas' holds an intermediate place between his poetry and his prose. It is characterised by a tone of pleasing melancholy, and the style, though somewhat artificial, is elegant and harmonious.

Johnson's prose works consist of short pieces, his Dictionary excepted. His 'English Dictionary' was a work of great labour, and the quotations are chosen with so much ingenuity, that, though necessarily mere fragments, they are amusing to read. Dr. Robertson, the historian, said that he had read Johnson's Dictionary from beginning to end; and it is probable that very few ever open it for reference without reading much more than the passage they looked for. It is however in some respects a very defective work. Johnson had scarcely any knowledge of the Anglo-Saxon, and no knowledge of any of the cognate Teutonic dialects; accordingly, the etymological part is not of much value; the etymologies being copied chiefly from Skinner and Junius. His definitions are constructed without sufficient consideration, and without any systematic plan. He also frequently errs in tracing the successive significations of a word. Between 1750 and 1760 he published the 'Rambler' and the 'Idler,' periodical essays in the style of the 'Spectator,'—works generally read and of very extensive influence in their day, but which now probably are comparatively seldom disturbed. His edition of Shakspeare was published in 1765; the preface is one of his ablest productions, particularly that part which relates to the unities and dramatic illusion. He had not sufficient antiquarian knowledge or poetical feeling for commenting on Shakspeare; his notes are not numerous, and though marked with his strong sense are only occasionally valuable. In

1755 he published the account of his journey in the Hebrides, an entertaining and an instructive work, though it discusses with needless solemnity subjects familiar to every inhabitant of the country, though strange to a townsman like Johnson. His 'Lives of the Poets,' published in 1781, are a useful and interesting contribution to English biography and criticism, and are too well known to require specific notice. The criticisms in this work are sometimes biased by political, religious, and even personal antipathies, as may be seen in his unfavourable judgment of Milton's poetry, dictated by his dislike for the republican and non-conformist; and his somewhat captious censure of Gray. His judgments of the general character of a poet are however more frequently correct than his criticisms upon particular passages and expressions. The style is on the whole perhaps more simple and better than in any other of his writings.

A complete list of Johnson's works is prefixed to Boswell's 'Life,' but from what has been stated, it sufficiently appears that his intellectual efforts were desultory and unconnected, and took the form of Essays, Lives, Critical Notices, Prefaces, &c. He had no comprehensive or profound acquaintance with any department of human knowledge; he did not attempt any systematic investigation of any considerable branch of metaphysical, ethical, political, or æsthetic science. Even as a grammarian, his acquirements were limited and superficial; of physical and mathematical science he knew scarcely anything. It may however be remarked that he had adopted that theory of ethics which is now commonly known by the name of utilitarian, as may be seen from his review of Soame Jenyns's 'Inquiry into the Origin of Evil;' Johnson here says of this theory, that it affords "a criterion of action on account of virtue and vice, for which he has often contended, and which must be embraced by all who are willing to know why they act or why they forbear, to give any reason of their conduct to themselves or others."

From his habit of writing for the booksellers, he had acquired a power of treating the most heterogeneous subjects with scarcely any preparatory knowledge; witness his papers on the construction of Blackfriars Bridge, and his very ingenious argument, dictated to Boswell, on a question of Scotch law. In English literature his reading was extensive, particularly in the writers of the 17th and 18th centuries; but he seems to have known comparatively little about the writers of the age of Elizabeth: his 'Lives of the Poets' begin with Cowley. He does not seem to have studied attentively the works of any of the chief English philosophers, as Bacon, Hobbes, Locke; his theological learning was but scanty; nor was he very well versed in the political history or laws of his country. He had a fair acquaintance with the ordinary Latin classics; of Greek he used to say that he knew but little; but it was found that Johnson's "little" was what some men of more pretensions to scholarship would have accounted great. He could read French and Italian; but he seems to have scarcely known anything of the modern literature of foreign countries.

Johnson's opinions were regarded by many of his contemporaries with a sort of superstitious reverence. In the present generation his credit had fallen lower than it deserved; but the notices of him by several of the greatest writers of the day, even when unfavourable, have served to show that he could not be safely neglected by the literary student, while by the general reader many of his works will continue to be read, from the vigour of thought which they display.

(Murphy, *Life*, in preface to Works; Boswell, *Life*, Croker's edit.; *Memoir* by Walter Scott; *Essays* by Macaulay and Carlyle. A brief but elaborate character of Dr. Johnson, written by Sir James Mackintosh, will be found in his *Life*, vol. ii. p. 166.)

*JOHNSTON, ALEXANDER KEITH, was born at Kirkhill, in the county of Midlothian, Scotland, December 23th, 1804, and educated at the High School of Edinburgh. His studies were at first directed with a view to the medical profession, but a predilection for the Fine Arts led to his being apprenticed to an engraver, where he acquired that taste for design which characterises all his works.

The favourite study of his youth, geography and its allied branches, soon absorbed his attention, and in order to reach the sources of information, he mastered successively the French, Italian, Spanish, and German languages, and thus prepared himself for founding a school of geography in his native country. His first large work, the 'National Atlas' in folio, projected in 1835, was published in 1843, when he was elected a Fellow of the Royal Geographical Society and appointed Geographer to the Queen for Scotland. The writings of Humboldt and Ritter had so inspired him with the importance of Natural Geography, as to induce him to project an atlas on this subject, on a scale hitherto unattempted, and successive visits to the Continent having brought him into contact and correspondence with these and many other distinguished cultivators of science, he devoted several years to the elucidation of the necessary materials, and in 1848 published his celebrated 'Physical Atlas' in folio. This work we find characterised in the 'Bulletin de la Société de Géographie,' Paris, 1851, as "Un des plus magnifiques monuments qu'on ait encore élevés au génie scientifique de notre siècle." On its appearance Mr. Johnston was elected an honorary member of the Gesellschaft für Erdkunde, Berlin, fellow of the Geographical Society of Paris, the Geological Society of London, &c. In 1850 he was elected a fellow of the Royal Society of Edin-

burgh, and has since acted on its council. To its papers he contributed 'An Historical Notice of the Survey of Scotland.'

Three years were next devoted to the production of a 'Dictionary of Geography,' which was published in 1851, and again, nearly re-written, in 1855. The first edition of his great work having been exhausted, a new and greatly improved issue has lately appeared, and is thus announced by the President of the Geographical Society, in his annual address, 1856: "Our associate, Mr. Alexander Keith Johnston, has completed the new edition of his superb 'Physical Atlas.' The publication of the first edition of this great work, ten years since, had the effect of introducing in this country almost a new era in the popular study of geography, through its attractive and instructive illustration of the prominent features of science. This second edition is to some extent an entirely new work, owing to the additions and improvements which have been introduced . . . and the addition of a large general index adds materially to the utility of this extensive compendium of natural geography." His contributions to medical geography have procured for Mr. Johnston the honorary fellowship of the Epidemiological Society of London.

Among Mr. Johnston's minor publications are an 'Atlas of the Historical Geography of Europe,' 4to; a reduced 'Physical Atlas,' in 4to, 25 plates, and 112 pages of text; a series of educational works, comprising Physical, General and Classical Geography, an Atlas of Astronomy in conjunction with Mr. Hind; and with Sir R. I. Murchison and Professor Nicol as coadjutors, a 'Geological Map of Europe.' Most of these works have rapidly passed through several editions.

JOHNSTON, DR. ARTHUR, was born in Aberdeenshire in 1587. At an early age he went abroad for medical education; and the degree of Doctor in Medicine was conferred on him at Padua in 1610. He travelled in various parts of the Continent, and resided for twenty years in France, marrying twice in the course of that period. He returned to his native country before 1625, and was soon afterwards appointed physician to Charles I., probably through the influence of Laud. After this appointment he must have resided chiefly in the neighbourhood of the court. In 1641 he died at Oxford, while on a visit to a daughter married there.

Johnston was the most extensive contributor, and is not unusually called the editor, of Sir John Scot's collection of Latin poems, the 'Delitæ Poetarum Sæculorum hujus Ævi Illustrium,' Amsterdam, 1637, 2 vols. 12mo; and besides several other volumes of compositions in Latin verse, he was bold enough to measure lances with Buchanan in a version of the Psalms, 'Paraphrasæ Poeticæ Psalmorum Davidis, Auctore Arturo Johnstono, Scoto,' Aberdeen, 1637, 8vo. This ambitious attempt led, many years afterwards, to a protracted controversy on the merits of the rival versions. The history of the dispute is related, and Johnston's works fully described and justly estimated, in Dr. Irving's 'Lives of Scottish Writers,' 1839, 2 vols. 8vo. It is enough here to say, that Johnston's high rank among modern writers of Latin poetry is universally admitted; and that, although in Scotland his psalms have usually been estimated much below Buchanan's, the justice of this sentence has been questioned by critics of authority, of whom Mr. Hallam is one.

JOHNSTON, GEORGE, a distinguished naturalist. He was born in 1798, and having been destined for the medical profession, he was apprenticed to the celebrated Dr. Abercrombie of Edinburgh. Having gone through the usual medical training, he graduated in Edinburgh in 1819. He subsequently settled as a general practitioner at Berwick-upon-Tweed. At Edinburgh he had acquired a taste for natural history, which he diligently cultivated through the remainder of his life. It is not often that a man so thoroughly and so largely employed in a laborious profession has occupied so prominent a position as an observer and writer as Dr. Johnston. At the time that he commenced his career at Berwick-upon-Tweed little was known of the lower forms of animal life to which he so successfully devoted his attention. His 'History of British Zoophytes,' and his 'History of British Sponges and Lithophytes,' published in 1838 and 1842, were amongst the first systematic works that were devoted to the classes of animals they describe. They not only included the descriptions of a large number of new species of these animals, but contained a great amount of matter altogether new to the British reader. It is true the habits of these creatures were not such as to command the same amount of attention as those described by White of Selborne, but in their relation to the general study of scientific natural history they take a position second to none that have been published during the present century. From the time of his first residence in Berwick he was an active contributor to the various natural history journals and the Transactions of natural history societies. Thus we find him preparing for his great work on Zoophytes in his 'Descriptive Catalogue of the recent Zoophytes found on the Coast of Durham,' in the second volume of the 'Transactions of the Natural History Society of Newcastle-upon-Tyne,' also in his 'Catalogue of the Zoophytes of Berwickshire,' in the 'Proceedings of the Berwickshire Naturalists' Club.' Of this club he was one of the founders, and an active member to the last.

Another class of animals almost as little known when he first began to work at them as the Zoophytes, were the Annelides. His papers on 'British and Irish Annelides,' with numerous notices of individual forms scattered through the pages of the 'Magazine of Zoology and

Botany' and the 'Annals of Natural History,' attest the value of his labours in this department of zoology. At the time of his death he was occupied on a distinct work devoted to the description and illustration of the British *Annelides*.

From time to time all the forms of Invertebrate life engaged his attention, and although much greater attention had been paid to the *Mollusca* than to the other classes, his contributions to the natural history of these animals constitute some of his most valuable labours. His papers on the *Mollusca* were numerous. The result of his study and observations on this class of animals was given in a large work entitled 'An Introduction to Conchology, or Elements of the Natural History of Molluscous Animals,' published in 1850. Dr. Johnston did not confine his attention to the Invertebrate animals: he loved the sea-side, and whatever the waves of the ocean brought to the shore he studied with diligence. Thus many of his papers embrace descriptions of fish—*Cetacea*, and other inhabitants of the sea. Nor did he limit himself to the study of the animal kingdom. In his constant journeys in his laborious practice no plant of the district escaped his attention, as is shown in his interesting work entitled 'Botany of the Eastern Borders.' It was his observant eye that first detected the new water-weed (*Anacharis alsinastrum*) in the lake at Dunse Castle in 1838, and again in the waters of the Whiteader in 1841. Few men have lived with higher claims to the name of a naturalist, and few have contributed more largely to the literature of the natural history of Great Britain. He took great interest in the spread of natural history literature, and was one of the founders of the Ray Society for the publication of works on natural history, and was one of the secretaries of the society till his death. He was a man of the most genial and kindly disposition, and greatly beloved in the circle of naturalists by whom he was surrounded, and whom he often met in the Naturalists' field club he had established. He was well read in the literature of natural history, and nothing delighted him more than imparting his copious stores of information to others. His correspondence was extensive, and many a living naturalist is indebted to him for encouragement in the prosecution of his earliest labours. In the latter part of his life he was not spared those trials which come upon the learned as well as the unlearned, and these acting upon a susceptible mind probably hastened the attack under which he sunk. He was seized with paralysis, and died on the 3rd of July 1855.

JOHNSTON, JAMES T. W., late Professor of Chemistry in the University of Durham. He was born at Paisley, about the year 1796. His father subsequently removed to Manchester, and afterwards returned again to Scotland, residing at Kilmarnock. During this time the education of young Johnston depended chiefly on his own efforts; he was however so successful that he was enabled to obtain his own livelihood by giving private instruction to pupils in the University of Glasgow. In 1825 he removed to Durham, where he opened a school. In 1830 he married the daughter of Thomas Ridley, Esq., of Park-end. By this marriage his circumstances were so much improved that he gave up his school, and determined to put in execution a plan he had long conceived of devoting himself to the study of chemistry. He accordingly repaired to Sweden, and became a pupil of the celebrated Berzelius. He made so much progress in his chemical studies, and became so well known as a chemist, that on the establishment of the University of Durham he was invited to take the readership in chemistry and mineralogy. This took place in 1833, whilst he was yet pursuing his studies on the Continent, and the chair was not occupied till he returned to fill it. On his return, he took up his residence at Edinburgh, and devoting himself to the department of agricultural chemistry he became appointed chemist to the Agricultural Society of Scotland. On the dissolution of this society, he left Edinburgh, and resided permanently in Durham. He now occupied himself principally with the production of works on the relation of chemistry to agriculture. In this he was very successful, and few writers have been more extensively read in this department of literature. His 'Lectures on Agricultural Chemistry and Geology' are an able exposition of the application of the principles of chemical and geological science to the art of agriculture. He also published a 'Catechism' on the same subject, which at the time of his death, in 1855, had gone through thirty-three editions, and has been translated into almost every European language. He had travelled in America, and was well known as an agricultural chemist in the New World; and his works there have as large a circulation as in his own country. His experience of America he gave to the world in a work entitled 'Notes on North America,' in which he discusses many of the important agricultural questions connected with the resources of that great country. He was an eminently popular writer and teacher, and all his writings exhibit an enthusiasm which renders them attractive even to the unscientific reader. One of the most popular and the last of his works was his 'Chemistry of Common Life,' which has had a vast circulation, and done much for diffusing a knowledge of the principles of chemistry involved in the ordinary occupations of human beings. In some parts of this work he has unintentionally fallen into error; and it is perhaps only right to state here that the remarkable statement made in that work with regard to arsenic-eating amongst the inhabitants of Styria and other parts of Europe, has been recently shown to be without foundation.

This work originally appeared as a series of magazine articles. Professor Johnston contributed to the 'Edinburgh Review' and other journals. He has also published many papers in the Transactions and Proceedings of scientific societies. In the summer of 1853 he was travelling on the Continent in his usual health, when he was suddenly seized with spitting of blood, which terminated in a rapid decline, and he died at Durham on the 18th of September of that year. He was made a Fellow of the Royal Society in 1837, and was a member of other learned societies.

JOINVILLE, JEAN, SIRE or LORD DE, born of a noble family of Champagne, was brought up in the court of Thibaut, king of Navarre and count of Champagne, then one of the most polished courts in Europe. Joinville followed Louis IX. in his first crusade in 1248, with a body of several hundred armed men, which he raised among his tenants; and he was present at the taking of Damietta, and at the disastrous campaign of Massoura, in which Louis and most of his army, with Joinville among the rest, were taken prisoners. Joinville narrowly escaped being killed by the Egyptians; but the ransom being paid, he followed the king to Acre, and was present at the war which was carried on in Palestine, until he returned to France with Louis in 1254. Being a great favourite with the king, and almost constantly near his person during the six years of that crusade, his narrative of that period, written in a simple unpretending style, is extremely interesting. It is entitled 'Histoire de St. Louis, IX. du nom, Roi de France, par Jehan Sire de Joinville,' and has been often republished. One of the best editions is that by Ducange, fol., 1668, with useful notes and learned dissertations. It has been translated into English by T. Johnes, 2 vols. 4to, 1807. The character of Joinville, a favourable specimen of a feudal lord in that, the golden age of chivalry, valiant, gay, witty, generous, shrewd, and yet at times careless through vivacity of temper, somewhat worldly and proud of his rank, but withal good-natured and sociable, forms a happy contrast with the piety, austerity, and simplicity of Louis, who however esteemed and loved Joinville for his sincerity and abilities, as much as Joinville cherished Louis's honesty and goodness of heart, of which he gave numerous and affecting proofs in his narrative. Joinville, after his return to his native domain, did not forsake the king, but frequently repaired to his court, and continued to enjoy Louis's confidence. When Louis, in 1269, set out on his second expedition, in which he died at Tunis, he invited Joinville to join him, who however excused himself. Joinville kept away from the corrupt court of Philip le Bel, but afterwards he is said to have joined the army which Louis X. collected at Arras against the Flemish. He died not long after; but the precise epoch of his death is not known. Joinville and his predecessor Villehardouin are among the oldest of the French chroniclers who wrote in the vernacular tongue.

JOMELLI, NICOLO, one of the few celebrated composers of the early part of the last century, whose works justify the encomiums bestowed on them, was born in 1714, at Aversa, according to Mattei—at Avellino, says Burney—both places being near Naples. He was initiated in music by the Canon Muzzillo, and afterwards studied at one of the Neapolitan conservatories, first under Feo, then as the pupil of Leo, confessing himself chiefly indebted to the latter for having inspired him with a true feeling for the art. Subsequently however, when he turned his attention to sacred music, he derived considerable improvement in the more elaborate branches of composition by his intercourse with the learned Padre Martini.

Jomelli produced his first opera at Naples, when only twenty-three years of age; and so speedily acquired fame, that in 1740 he was summoned to Rome, where he composed two operas, and was warmly patronised by the Cardinal Duke of York. Next year he proceeded to Bologna, and brought out his 'Ezio.' He then returned to the papal capital, and produced one of his finest works, 'Didone.' This led to his being invited to Venice, at that time the great theatre for the display of musical excellence, where his 'Merope' for the Teatro Fenice, and a 'Laudate' for the church of Santo Marco, well sustained his reputation. The failure of his 'Armida,' in the following year, at Rome, determined him to visit Germany, and at Vienna he formed an acquaintance with Metastasio, which ripened into a friendship of the closest kind, that death only terminated. To the enlightened conversation and judicious criticisms of the Imperial poet he always confessed his obligations, and ascribed much of the success of his later productions. He set the 'Achille in Sciro,' and got up afresh the 'Didone,' of his illustrious friend, both of which were received by the Germans with enthusiasm.

Metastasio, speaking of Jomelli, in several letters, says, "He is of a spherical figure, pacific disposition, with an engaging countenance, most pleasing manners, and excellent morals. . . . He is the best composer for words of whom I have any knowledge. . . . If ever you should see him, you will be attached to him; he is certainly the most amiable *gourmand* that ever existed."

At Vienna Jomelli remained two years, where he devoted no inconsiderable portion of his time to the empress Maria Theresa, to whom he gave instructions in music. He was afterwards recalled to Rome, and there produced several operas, also his famous oratorio 'La Passione.' The Duke of Würtemberg now prevailed on him to visit Stuttgart, in which city he resided nearly twenty years, and composed an incredible number of Italian operas, most of them however now

forgotten; but his 'Missa pro Defunctis,' or 'Requiem,' there produced, will remain as a monument of his genius. When the Duke of Wirtemberg was obliged to reduce his establishment, Jomelli went to Naples, where the ill success of two new operas operated so powerfully on his sensitive mind, that an attack of paralysis was the consequence. From this however he sufficiently recovered to compose a Cantata and a 'Miserere,' the latter being by many considered the finest of his works. He died at Naples, in 1774.

Jomelli has been not unaptly called the 'Glück of Italy.' He possessed the deep feeling and vigour that characterised the German composer, and is nearly as rich in accompaniments. Indeed in his admirable scena, 'Berenice, ove sei!' in the serious opera of 'Lucio Vero,' he not only left at an unmeasurable distance all former and contemporary composers, but gave birth to a work which in its way has hardly yet been surpassed, if ever equalled. His 'Chaconne,' though not of so high an order of composition as some of the above-named works, has by its great and long-continued popularity given proof of its originality and sterling merit.

*JOMINI, HENRI, historian appointed by Napoleon I. to write the military records of his reign, was born March 6, 1779, at Payerne, in the Pays de Vaud, of which canton his father was, for several years, principal magistrate. In very early life he was placed in a merchant's office, and in that employment he continued for eight or nine years. In 1795, he was enrolled in the Swiss militia, and he attained the rank of lieutenant-colonel before he had completed his twentieth year. At this time, the sudden invasion of Switzerland, and its speedy subjugation by Menard and Brune, deprived him of his rank in the army, as well as of his civil office, and, having to begin his career again, he proceeded to Paris, in 1799, in quest of a new vocation.

He spent the next few years in commercial pursuits of a desultory kind; and was beginning to establish himself as a stockbroker, when he became acquainted with General Ney, and his future pursuits were fixed. Supported by the powerful recommendation of that general, he received a valuable appointment in one of the large mercantile houses of Paris; with ample leisure to pursue his studies of military tactics, which he had begun as a mere boy, but which had been interrupted by the conquest of his country. In 1804, at the age only of twenty-five, he produced the first part of his 'Traité des Grandes Opérations Militaires,' which determined Ney to attach him permanently to the French army, and to recommend him to the First Consul. Shortly after he was appointed aide-de-camp to that general, with the rank of chef-de-bataillon. For the five ensuing years, Jomini attended the marshal in every campaign, and exhibited as much skill in the closet as daring in the field. At Michelsberg he led the storming party and carried the heights; and in 1805, the clear and decided plan he drew up for the line of march of the sixth corps, contributed to the capture of Mack's army. Meanwhile, Napoleon, who had read and approved of his 'Traité,' made him a colonel. He distinguished himself also in the campaign of Prussia, in 1806, especially at the battle of Jena, in the very crisis of which he rescued Marshal Ney from a most perilous position, when sorely pressed by Prince Hohenlohe. For this exploit he was created a baron. Colonel Jomini accompanied Marshal Ney into Spain in 1808; but in 1809, his enemies, jealous of the consideration he had acquired by his strategical skill, found means to prejudice his benefactor against him, and Colonel Jomini was suspended for a time from active service. Mortified by this treatment, the colonel applied for his discharge in 1810, having already determined to enter the Russian service. The French Emperor however refused to part with him, and promoted him to a brigade. Not long after this, General Jomini was appointed historiographer of the empire, and when the Russian campaign was opened, in 1812, he was commissioned to write the history of the Grande Armée. Few officers exhibited more zeal or greater fortitude than Jomini throughout this disastrous expedition; his real talents were now appreciated, he was made governor of Wilna, then of Smolensko, and he again rescued Marshal Ney from a position of great peril.

After the battle of Lutzen, in 1813, he returned to the staff of Marshal Ney; soon after he distinguished himself so much at the battle of Bautzen, that Ney urged the emperor to make Jomini a general of division. Far from complying, Napoleon, on some new ground of displeasure, suspended him a second time. Irritated by this treatment, General Jomini resolved to break for ever with Napoleon; he therefore accepted the rank of lieutenant-general in the Russian army, was tried by court-martial for desertion of that which he had left, and though absent, sentenced to be shot. Still, in spite of this appointment, General Jomini did not take an active part in the war of 1814 against France. In 1815 he returned to Paris for a short time, and received the cross of St. Louis from the restored king. At the same time he employed every means he could devise to prevent the execution of Marshal Ney. After the war he settled in Russia, and introduced many important reforms, both theoretical and practical, into the military system of that country. In 1855 he received permission from the Czar to settle in Brussels.

Besides the work already mentioned, General Jomini has published the following: 'Correspondance entre le Général Jomini et le Général Berezin sur la Campagne de 1813;' 'Histoire des Guerres de Frédéric II.,' 1818; 'Principes de la Stratégie,' 1818; 'Vis politique

et militaire de Napoleon,' 1827; 'Précis de l'Art de la Guerre,' 1838; 'Précis de la Campagne de 1815,' 1839; 'Atlas Militaire,' &c., all of which are deemed of great excellence by military men.

JONAH was one of the twelve minor Hebrew prophets. He is mentioned in 2 Kings xiv. 25, where we are told that Jeroboam II. "restored the coast of Israel from the entering of Hamath unto the Sea of the plain, according to the word of the Lord God of Israel, which he spake by the hand of his servant Jonah, the son of Amittai, the prophet, which was of Gath-Hepher," or Gittah-Hepher (Joshua xix. 13), a city near the eastern boundary of the tribe of Zebulun, which formed a part of the kingdom of Israel, and afterwards of Galilee. From this passage most critics have supposed that Jonah lived under Jeroboam II., who reigned from B.C. 828 to B.C. 782. Bishop Lloyd places him near the close of Jehu's reign, or the beginning of that of Jehoahaz. The book of Jonah, with the exception of the highly poetical prayer in chap. iii., is entirely narrative. It may be divided into two parts. The first (chaps. i. and ii.) relates the attempt of Jonah to evade God's command to preach to the people of Nineveh by fleeing to Joppa, and there embarking in a ship sailing for Tarshish; his being thrown into the sea and swallowed by a fish, in the belly of which he remained three days and three nights; and his deliverance from the fish, which at the command of the Lord vomited him out upon the dry land. The second part gives an account of his second commission to Nineveh, where the king and people repented at his preaching (chap. iii.); his anger because God, upon the people's repentance, did not execute the judgments which the prophet had predicted, and the striking reproof which Jonah received (chap. iv.). The history of Jonah is referred to in several passages of the New Testament (Matt. xii. 39-41; xvi. 4; Luke xi. 29, 30, 32). The canonical authority of the book is generally admitted.

Bochart supposes that the fish which swallowed Jonah was a species of shark ('Bocharti Opera,' tom. iii., p. 742), and Townsend endeavours to identify it with the idol-fish worshipped at Ascalon under the name Derceto.

(The *Introductions* of Horne and Jahn; Calmet, *Dictionary*; Townsend, *Old Testament arranged in Chronological Order*; Rosenmüller, *Scholæ*; and list of commentators in Watt's *Bibliotheca Britannica*.)

JONATHAN APPHUS was the youngest brother of Judas Maccabæus, on whose death he was chosen commander of the Jewish forces. After carrying on the war with some success for a few years, he made peace with Bacchides, the general of Demetrius Soter. At the commencement of Alexander's insurrection [ALEXANDER BALAS, vol. I. col. 1119] Jonathan's alliance was warmly courted both by Demetrius and by Alexander. He joined the latter, by whom he was appointed high-priest (B.C. 153). He continued in great favour with Alexander during that king's life, and defeated Apollonius, the governor of Coele-Syria, who had espoused the cause of Demetrius Nicator. He also laid siege to the Syrian garrison in the castle on Mount Zion. On the accession of Demetrius Nicator, Jonathan succeeded in obtaining the confirmation of his power; but, disgusted by the faithless treatment he afterwards received from Demetrius, he joined the insurrection of Trypho in favour of Antiochus Theos, whose cause he supported with great success. He also confirmed the alliance made by Judas with the Romans. Trypho had put Antiochus on the throne with the purpose of afterwards usurping it himself. Dreading the powerful opposition of Jonathan, he took him by treachery and put him to death, in B.C. 144. (1 *Maccabees*, chaps. ix.-xii.; Josephus, *Antiquities of the Jews*, book xiii., chaps. i.-vi.; Jahn, *Hebrew Commonwealth*, vol. i.)

JONES, INIGO, who has been styled the English Palladio, and who forms an epoch in the history of architecture in this country, was born in the neighbourhood of St. Paul's in London, where his father was a respectable cloth-worker. Of his youth and education very little is known, except that by his talent for drawing he attracted the notice of William earl of Pembroke, by whom he was sent abroad, where he spent three or four years studying with his pencil, measuring and examining various remains of antiquity, as well as modern buildings. At that period such work required much greater application and diligence than at present, when almost every ancient building has been shown in engravings, and when the student has been previously familiarised at home with specimens of almost every style, including those of edifices avowedly Italian in their design. Jones, on the contrary, found himself in an entirely new world of art, for the ancient orders were then utterly unknown in England, nor were the Italian orders known, except as exhibited in diminutive columns, pilasters, entablatures, and pediments, applied merely as ad-cititious ornaments patched upon a degenerate Tudor style. So far the times were eminently propitious to Jones, nothing more being required than for him to transplant the full-grown Italian style, as he found it in the works of Palladio and that school, in order at once to obtain the celebrity of an originator. It was not however until many years after his first visit to Italy that he fully adopted the 'classic' taste.

About 1604 he was invited from Italy to Denmark by Christian IV., for whom he is said to have designed part of the buildings of the royal chateau of Frederiksberg, and also the palace of Rosenborg. Fortunately this is doubtful, there being nothing in the architecture of

either of these that would reflect any credit on the taste of our English Palladio. Yet, whether the patronage of the Danish monarch did much for Jones or not, in itself, it promoted his interest at the English court, Christian's sister being the queen of James I. Inigo returned to England in 1605, and was immediately employed at court in devising the machinery and decorations of the costly masques and pageants then in vogue. For a time Ben Jonson was associated with him in this occupation, but Jones's arrogance disgusted the somewhat erabbed poet, who, after a good deal of mutual bickering, threw up his share of the duty; and subsequently introduced numerous references in his plays to Jones, under contemptuous nick-names.

Jones was soon after his return to England appointed architect to the queen and to Prince Henry. None of his best works belong to this period, for it was not till after his second return from Italy, which he again visited in 1612, on the death of the prince, that he emancipated himself from the mesquin style that had succeeded the downfall of Tudor architecture. Without this second residence in Italy he might have designed a palace for Whitehall quite as extensive as the one he actually made, but it would, no doubt, have been very different in style. On his return he was appointed to be surveyor-general of the royal buildings, and commenced his plans for that just mentioned. Soon after the only portion ever built of it, namely, the Banqueting House, was completed, he engaged, at the desire of James I., in a task of a very different nature, that of ascertaining the origin and purpose of Stonehenge—a task, it is needless to say, for which his previous studies had in no way fitted him: with a ludicrous disregard of all probability he came to the conclusion that this rude circle of unhewn stones was a temple of Coelus, erected by the Romans.

After the building at Whitehall, Jones was engaged upon the back-front of old Somerset House, and in adding a Corinthian portico to the west front of old St. Paul's. Both of them have been greatly extolled, more especially the latter, but neither remains. We have however another very celebrated production of Inigo's in the church of St. Paul, Covent Garden, in regard to which Quatremère de Quincy, though by no means unfavourable to him, says the most remarkable thing about it is the reputation it enjoys. York Stairs, Ashburnham House, Westminster, a house originally built for the Earl of Lindsey on the west side of Lincoln's Inn Fields, and Surgeons' Hall, yet remain among his works in the metropolis; and when we say that the last-mentioned has been asserted by some to have been one of his best, no very flattering notion is conveyed of the taste of his admirers. In fact the Banqueting House is almost the only specimen that accounts for his reputation, and even that we suspect is now more praised as a matter of course, than really admired. The designs for the palace of Whitehall, together with many others by Jones, were published in a folio volume by Kent. To give a list of all the buildings attributed to him, or even of the principal ones in addition to those mentioned, would occupy a considerable space. Inigo Jones died in June 1653, at the age of eighty.

JONES, JOHN, LL.D., was born in the parish of Llandinog, in Caermarthenshire, where his father was a respectable farmer. He was educated at a grammar school at Brecon, and afterwards became a student at the Unitarian New College, Hackney, where he was a favourite pupil of Gilbert Wakefield. In 1792 Mr. Jones was appointed classical and mathematical teacher in the Welsh Academy, Swansea, which situation he held about three years, and then settled at Plymouth Dock as minister of the Unitarian congregation at that place, where he remained two years. He then became minister of the Unitarian congregation at Halifax in Yorkshire. In about three years he removed to London, where he resided during the remainder of his life, chiefly occupied as a classical teacher, and preaching only occasionally in the place of others: he never took charge of a congregation. A few years before his death he received the diploma of LL.D. from the University of Aberdeen. He died January 10, 1827.

Dr. Jones was the author of several works, some of which are religious, chiefly in support or defence of the evidences of Christianity. Of these one of the most important was, 'Illustrations of the Four Gospels, founded on circumstances peculiar to our Lord and the Evangelists,' Lond., 1808, 8vo. In 1803 he published a short Latin Grammar for the use of schools; in 1804 a Greek Grammar, which has been frequently reprinted, but the year before his death he remodelled it, and changed the title to that of 'Etymologia Græca.' In 1812 he published a Latin and English Vocabulary, which he republished in 1825 as 'Anthologie Latine, or a Development of the Analogies by which the Parts of Speech are derived from each other.' But his chief work, to which he devoted a great many years of his life, was his 'Greek and English Lexicon,' which was published in 1823, in 1 vol. 8vo, and again in 1826. Dr. Jones was one of the first to introduce into this country the practice of teaching Greek through the medium of English instead of Latin; and the first Greek and English Lexicon for general use was Dr. Jones's. He afterwards published an abbreviated edition for the use of schools, 'The Tyro's Greek and English Lexicon.' The success of Dr. Jones's Lexicon was very great, and a large impression was soon disposed of. The work, as might be expected, was not without its faults, and was roughly treated in the second number of the 'Westminster Review.'

JONES, JOHN PAUL, was born July 6, 1747, at Arbigland, in the parish of Kirkbean, Kirkcubrightshire, Scotland. The name of his

father, who was a gardener, was Paul; the addition of Jones was assumed by the son after he grew up in life. He went to sea at the age of twelve, and after making many voyages to America and other parts, and for a time acting as mate of a slaver, he was, in 1768, made captain and supercargo of a vessel which he had shortly before brought safe into port, having, at the request of those on board, when he was sailing in her as a passenger, taken the command on the death of the captain and mate. Having in a few years made a good deal of money, he settled in Virginia in 1773, on a property which fell to him by the death of an elder brother, who had been for some years established there as a planter. After the declaration of their independence by the American colonies, he offered his services in the war against his native country, in which he soon greatly distinguished himself. On being appointed to the command of the Providence, he cruised among the West India Islands, and, as it is stated, made sixteen prizes in little more than six weeks. In May 1777 he proceeded, by order of the congress, to France, where he was immediately appointed, by Franklin and his brother commissioners, to the command of the Ranger, in which the next year he sailed upon a cruise to the coasts of Britain, and, after making a descent by night at Whitehaven, where he spiked the guns of the forts and set fire to one or two vessels, besides plundering the house of the Earl of Selkirk on the opposite coast of Scotland, returned to Brest with 200 prisoners, and the boast that he had for some time kept the north-western coast of England and southern coast of Scotland in a state of alarm with his single ship. In the autumn of 1779 he set sail again, with an increased force, on a similar expedition for the eastern coasts of England and Scotland, in which his success and the terror he created were still greater than on the former occasion. Among other exploits, having encountered the Baltic fleet, he, with a squadron of three ships of war and a brigantine, attacked its convoys, the Serapis frigate and the Countess of Scarborough, off Flamborough Head, on the 23rd of September, and, after a sanguinary engagement, succeeded in capturing the first-mentioned of these vessels, though the commander, Captain Pearson, fought with the utmost resolution against Jones's superior force. Jones's own ship, the Bonhomme Richard, was so damaged in the engagement that it sank two days afterwards. For this achievement he was, on his return to Paris, presented by Louis XVI. with a richly ornamented sword, bearing a pompous inscription, was invested with the military order of Merit, and received in every way the most distinguished reception both from the government, the court, and in general society. At this time it seems he wrote verses, and evinced a violent ambition to make a figure in the fashionable world. On his return to America, in Feb. 1781, a gold medal was voted to him by congress. He then served till the peace under the French admiral D'Estaing, after which he proceeded to Paris with the appointment of agent for prize-money. Some years afterwards he entered the Russian service with the rank of rear-admiral; but disputes in which he became involved with the Russian naval authorities soon compelled him to retire, on which he returned once more to Paris, where he lived till his death, 18th of July 1792. Having brought himself into general discredit by his coarse, boastful, and quarrelsome habits, while many shunned him as one whose successes were not only gained against his native country, but in their kind savoured too much of piracy to be consistent with modern notions of legitimate warfare, he gradually sunk into poverty and neglect before he was attacked by disease. By American writers however he is regarded as a hero, and we find him sometimes spoken of as "the naval hero of the Americans in their war for independence." An inflated account of Jones, which professes to be translated from memoirs written by himself, was published during his life in Paris, 'Mémoires de Paul Jones, écrits en Anglais par lui-même et traduits sous ses yeux par la Citoyen André,' Paris, l'an vi. (1798); and a Memoir of Jones, by Mr. J. S. Sherburne, was published at Washington in 1828. Some account of his traditional reputation may be found in a singular book entitled 'The Scottish Gallovidian Encyclopædia,' by John Mactaggart, 8vo, London, 1824 (pp. 373-376). According to this writer, who tells us that he has had his information about Jones "from the lips of many who personally knew him, and all about his singular ways," he was "a short thick little fellow, about five feet eight in height, of a dark swarthy complexion." "He was," continues the account, "a common sailor for several years out of the port of Kirkcubright, and was allowed to be unmatched on that coast for skill in sea matters."

*JONES, OWEN, architect, is well known from his works in that branch of his art to which he has given especial attention, namely, ornamental decoration, and the harmonious effect of colour. This he has applied not merely practically and to the enrichment of the interiors of buildings, but to book illumination and ornamentation; and a considerable proportion of the 'drawing-room-table books' of the last fifteen years, in their title-pages, the margins of their leaves, and their bindings, display tasteful designs from Mr. Jones's hand. To chromatic decoration his attention was directed through his studies during his extensive travels, and from some of these resulted his work, illustrating the palace of the Alhambra at Granada in Spain. Mr. Jones was born in Wales about the year 1809; he was articled to Mr. Lewis Valliamy, the architect, himself known for his studies in architectural ornamentation. Subsequently Mr. Jones left England, and was absent about four years,—extending his travels to Turkey and Egypt, with several French artists as companions. In 1834 he

was at Granada, and in conjunction with M. Jules Goury collected the materials for the first section of the work on the Alhambra. M. Goury having died, the publication, in parts, was undertaken by Mr. Jones; who himself with assistants executed the printing in colours and gold, thereby mainly contributing to the general introduction of that branch of lithography into this country. The process, it is well known, requires attention as to the accurate "registering" or fitting of the separate stones, or colours; and this, Mr. Jones attained with great pains and cost, plates being frequently destroyed when not at first successful. The publication was commenced about the year 1836; in 1837, Mr. Jones again visited Granada, and in 1842 the final portion of the work was issued under the title,—"Plans, Elevations, Sections, and Details of the Alhambra," &c. It includes a complete translation of the Arabic inscriptions and an historical notice of the kings of Granada, by Señor Pascual de Gayangos. From about this time Mr. Jones's name is found connected with the ornamental designs and chromatic printing, to many new works or new editions which were published with elaborate embellishments by Messrs. Longman and Co., and others. He has also made a considerable number of tasteful designs for the articles of stationery manufactured by the Messrs. De la Rue. His ornamentation has generally a character similar to that of what may be called the Mohammedan styles; the merit of which he has much advocated,—and with some reason, having regard to the amount of variety which is displayed in them with simple elements, and their recognition of one, much-neglected, but correct principle in surface decoration, namely, the avoidance of imitation of relief. In 1842 he published 'Designs for Mosaic and Tesselated Pavements,' with an essay by F. O. Ward, on their material and structure, and in 1844, in the exhibition of decorative works sent in to the Commissioners of Fine Arts, he exhibited a large plan of the Houses of Parliament, including designs for the pavements of all the chief halls and corridors of that building. In addition to his works above referred to, Mr. Jones was engaged in the architectural design and superintendence of some buildings, and he was a competitor in the competition for the building of the Army and Navy Club. In general architectural character however, and even in the ornaments of Moorish character which he introduced, he did not at that time succeed as well as in interior decoration, in which a well-known shop in Regent-street (Houbigant's) may be named as one of the most important attempts at that time in London to improve the artistic character of such places. A recent work of his however in the same street (Jay's) with less elaboration, shows what is probably a better treatment of colour, combined with much beautiful delineation of form;—and in this he has adopted the character of Greek ornament. On the formation of the staff of officers for the Exhibition of 1851, Mr. Jones was named one of the "Superintendents of the Works,"—chiefly with a view to the decoration of the structure, and the effective grouping of the contents. The problem of the decoration was a novel one, and Mr. Jones's original proposals, which he stoutly supported by theory, were very freely discussed, and became somewhat modified in the application. He however always maintained the propriety of using the primary colours, and of using them in certain proportionate quantities in which the reflected rays are held to constitute white light, and also of using them on particular surfaces supposed to be adapted to the force of each colour; whilst his opponents we believe to the last, held that although a good effect was produced, it was not the effect previously described by Mr. Jones, but one which tended rather against than for the particular reasons which he had given. In the year 1852, one of the lectures at the Society of Arts, relative to the Exhibition, was given by Mr. Jones, and afterwards published under the title,—"An Attempt to define the principles which should regulate the Employment of Colour in the Decorative Arts; with a few words on the necessity for an Architectural Education on the part of the public." He gave courses of lectures subsequently at the London Institution and other places, on a similar subject.

In May 1852, in the prospectus of the present Crystal Palace Company, Mr. Jones's name appeared as "Director of Decorations;" and soon afterwards, in conjunction with Mr. D. Wyatt, he was commissioned to visit many of the chief buildings and galleries of Europe, in order to collect the remarkable series of casts and works of art which are now exhibited. When the building was ready, the courts of architecture and sculpture were commenced; and the Egyptian, Greek, Roman, and Alhambra courts, and the decorative painting of the general fabric, were then completed under his directions. In the building he somewhat modified the scheme of decoration which he had endeavoured to exemplify in Hyde Park. In that case, there were some distinct questions as to the painting of the columns, some of the objectors contending against painting them in stripes, others arguing for what they styled, though in that particular case with inadequate reason—structural truth; for which they supposed a bronze colour was essential. In the buildings at Sydenham Mr. Jones has painted the columns dark red, or marone, and with happy effect. For the authorities for the decoration of the Egyptian Court, Mr. Jones was assisted by Mr. Bonomi, Mr. Sharpe, and others, but the result as a realisation of the character of Egyptian architecture, as to which a claim was advanced by the newspaper press beyond what Mr. Jones would have put forth, has been of course contested. In the polychromatic decoration of the Greek Court, however, Mr.

Jones's illustrations of his views regarding the ancient practice, were the subject of many comments, even prior to the opening of the exhibition; so that on that occasion, he thought fit to publish with the handbooks, 'An Apology for the Colouring of the Greek Court by Owen Jones; with arguments by G. H. Lewes and W. Watkiss Lloyd,' and other matter, wherein he draws arguments from the discoveries of painted enrichments by Mr. Penrose, to whose work however a critical study should be given before accepting the restorations given in it, or deduced by Mr. Jones from it. Some idea of the tendency of Mr. Jones's views may be formed by our stating that he had even earlier come to the conclusion that the shafts of the columns of the Parthenon were entirely gilt. With regard to the painting of sculpture—an old subject of controversy, but one of now growing interest—Mr. Jones equally adopted the extreme view, that the whole surface of the marble was coated with thick paint, and at the Crystal Palace he has painted one portion of the Elgin frieze in party colours, on that principle, the hair of the figures being gilt. The question (between the advocates of the use of colour) as to the ancient practice may now be said to be between what Mr. Jones advocates, and the mere staining of marble, combined perhaps with the introduction of some painted ornaments. In the Alhambra Court Mr. Jones has presented the most elaborate coloured decoration that has been seen in England; and, allowing for a few trifling emendations or alterations to adapt the work to the Crystal Palace structure, he has given a better representation of the decorations of the original Alhambra than could be obtained from that decaying work of art. These several works occupied him about three years, requiring an amount of careful manipulation, scarcely preceded even during the middle ages; and by his minute supervision of them he must be held to have served the progress of decorative art in this country. He has also written a 'Handbook to the Alhambra Court,' wherein he has given a very clear exposition of the principles of ornamentation, and some arguments also advanced by others, relative to the nature and office of architectural art. Recently Mr. Jones has commenced the publication of a work called 'The Grammar of Ornament,' devoted to numerous illustrations of the ornaments of the different styles.

Of the St. James's Hall, about to be commenced under his direction, some illustrations have appeared in the 'Builder' (vol. xiv, 1856); and these show that the interior will probably exhibit even greater novelty and elaboration, with tasteful design and good art, than have yet been seen combined in Mr. Jones's works as a practical architect.

* JONES, THOMAS RYMER, a distinguished writer on comparative anatomy and physiology. He was educated for the medical profession, and having studied in London and Paris, he became a member of the College of Surgeons of England in 1833. Being afflicted with a slight deafness he determined to abandon the medical profession, and to devote himself to the science of comparative anatomy. His first papers on this subject were published in the 'Proceedings of the Zoological Society,' and consisted of the dissections of several forms of *Mammalia*, as the Tiger, Agouti, and Opossum. On the establishment of King's College, London, he was appointed to the chair of Comparative Anatomy, a position he still holds. At this time no complete treatise on the subject of comparative anatomy existed in the English language, and in 1838 he published 'A General Outline of the Animal Kingdom.' This work at once gained for him a high position as a comparative anatomist and physiologist, and is at the present moment one of the most complete works upon the general subject of the anatomy of the animal kingdom. A second edition with considerable additions was published in 1856. In 1840 he was appointed Fullerian Professor of Physiology in the Royal Institution of Great Britain. He was subsequently appointed Examiner in Comparative Anatomy and Physiology in the London University. In 1845 he published the first volume of a work entitled 'The Natural History of Animals.' This work embodied the substance of his Fullerian lectures, and constitutes a most interesting introduction to the study of zoology. A second volume has since been published, but it is to be regretted that the work is not yet completed (1856). Professor Jones is an attractive popular lecturer, and is well known amongst the literary and scientific institutions of this country for his eloquent and instructive lectures on natural history. During the progress of the 'Cyclopædia of Anatomy and Physiology,' he was one of the most frequent contributors to its pages. He was elected a Fellow of the Royal Society in 1844.

JONES, SIR WILLIAM, was born in London, September the 28th, 1746. William Jones, his father, who was a mathematician of some eminence, was born in 1680, and died in 1749. He was the author of 'A New Compendium of Navigation,' 8vo, London, 1702; 'Synopsis Palmariorum Matheseos, or a New Introduction to the Mathematics,' 8vo, London, 1706; 'Analysis per Quantitatum Series, Fluxiones, ac Differentias,' &c., 4to, London, 1711; besides some papers in the 'Philosophical Transactions.'

William Jones having died when his son was only three years of age, the care of the child's education devolved upon his mother, who appears to have been a sensible and intelligent woman. Jones was remarkable in his early years for his progress in learning. At the age of seven he was sent to the grammar-school at Harrow, and though his classical studies were suspended for a twelvemonth when he was nine years old, in consequence of an accident which kept him from the

school, he surpassed almost all his schoolfellows in learning; and so high an opinion had Dr. Thackeray, at that time head-master of the school, formed of the talents of his pupil, that he used to say that "if Jones were left naked and friendless on Salisbury Plain, he would nevertheless find the road to fame and riches." Dr. Thackeray was succeeded by Dr. Sumner, who had an equally high opinion of the abilities of Jones; he has been known to declare "that Jones knew more Greek than himself, and was a greater proficient in the idiom of that language." During the last two years of his residence at Harrow Jones did not confine himself to the study of the classical writers; he learned the Arabic characters, and made some progress in Hebrew. He devoted a considerable part of his time to composition in Latin, Greek, and English; some of his juvenile pieces have been printed in the fragment of a work which he began at school, and entitled 'Limon,' in imitation of a lost work of Cicero. During the vacations he studied the French and Italian languages.

In 1764, at the age of seventeen, he entered at University College, Oxford, where he continued to prosecute his studies with the greatest diligence. He especially directed his attention to the study of Arabic and Persian; and employed his vacations in reading the best authors in Italian, Spanish, and Portuguese. In 1765 he left Oxford, and went to reside in the family of Earl Spencer, in order to superintend the education of Lord Althorp. In 1770 he resigned this situation with the intention of going to the bar, but he did not immediately commence his legal studies. During the five years that he resided in Earl Spencer's family he made great acquisitions in Oriental literature, and obtained by his publications the reputation of being one of the first Oriental scholars of his age. In 1768 he was requested by the king of Denmark to translate the 'Life of Nadir Shah' from the Persian into French; this translation was published in 1770, with a treatise on Oriental poetry, also written in French, in which he has translated several of the Odes of Hafiz into French verse. In the following year he published an excellent grammar of the Persian language: it has been republished of late years with many additions and improvements by the late Professor Leo, of Cambridge. In his twenty-first year Jones began his 'Commentaries on Asiatic Poetry' in imitation of Bishop Lowth's 'Prelections on the Sacred Poetry of the Hebrews.' This work, which was written in Latin, and was published in 1774 under the title of 'Poeseos Asiaticae Commentariorum Libri Sex,' contains many excellent remarks on Oriental poetry in general, and translations from the most celebrated Hebrew, Arabic, Persian, and Turkish poets. It was republished by Eichhorn, at Leipzig, 1776. He also began, during his residence with Earl Spencer, a Dictionary of the Persian language, in which the principal words were illustrated by quotations from the most celebrated Persian authors. In 1771 he replied anonymously in French to Anquetil du Perron, who had attacked the University of Oxford and some of its learned members in his introduction to the 'Zend-Avesta.' This reply was written in such good French that Biorn Sthal, a Swedish Orientalist, says, "that he had known many Frenchmen so far mistaken in the writer as to ascribe it to some *bel-esprit* of Paris." In 1772 Mr. Jones published a small volume of poems consisting chiefly of translations from the Asiatic languages.

In 1774 Mr. Jones was called to the bar. Feeling the importance of devoting his whole time to his legal studies, he left all his Oriental books and manuscripts at Oxford, and diligently attended the courts of common law. During this time he wrote an essay on the law of bailments, which has since been republished. The work is characterised by Jones's usual perspicuity and ease of expression; so far as concerns the arrangement and matter, we are not aware that it contains anything original, and it is sufficient to read it to be convinced that the author had not a mind adapted to seize with precision the fundamental principles which form the science of law. Jones's panegyric on Blackstone is sufficient to show in what manner he had studied law.

In 1780 he became a candidate to represent the University of Oxford in parliament, but finding that he had no hope of success in consequence of his opposition to the ministers of the day, and his condemnation of the American war, he withdrew from the contest. His opinions on political subjects are given in his 'Enquiry into the Legal Mode of Suppressing Riots,' in his 'Speech to the Assembled Inhabitants of Middlesex,' &c., in his 'Plan of a National Defence,' and in his 'Principles of Government;' which are printed in the eighth volume of his works (8vo edition). After an interval of six years, when he had acquired great reputation in his profession, he again resumed his Oriental studies, and employed the leisure hours of the winter of 1780-1 in translating some ancient poems of the highest repute in Arabia, which are called *Moallakat*, or 'suspended,' because they are hung up in the Temple of Mecca. In 1783 he was appointed, through the influence of Lord Ashburton, a judge in the supreme court of judicature at Fort William in Bengal; on which occasion he was knighted. A few weeks after he married Miss Shipley, the eldest daughter of the bishop of St. Asaph.

Sir William Jones arrived at Calcutta at the close of the year; and from this time to that of his death, a period of eleven years, he devoted all his leisure time to the study of Oriental literature. Almost immediately after his arrival he induced those persons who had paid attention to Oriental literature to unite in forming a Society "for inquiring into the history and antiquities, the arts, sciences, and literature of Asia."

To the 'Asiatic Researches,' which were published by this society, of which Sir William Jones was the first president, Oriental scholars in Europe are indebted for much of their knowledge of the literature and antiquities of the Hindoos. Sir William Jones contributed the following treatises to the first four volumes of the 'Asiatic Researches': eleven 'Anniversary Discourses' on the different nations of Asia, &c.; 'A Dissertation on the Orthography of Asiatic Words in Roman Letters;' 'On the Gods of Greece, Italy, and India;' 'On the Chronology of the Hindus;' 'On the Antiquity of the Indian Zodiac;' 'On the Second Classical Book of the Chinese;' 'On the Musical Modes of the Hindus;' 'On the Mystical Poetry of the Persians and Hindus,' containing a translation, of the *Gîttagovinda* by Jayadêva; 'On the Indian Game of Chess;' 'The Design of a Treatise on the Plants of India;' and many other treatises of less importance.

The study of Sanskrit principally engaged the attention of Sir William Jones during the first three or four years of his residence in Bengal. When he had attained sufficient proficiency in this language he proposed to the government to publish a copious digest of Hindoo and Mohammedan law; he offered to superintend the compilation, and to translate it. This offer was willingly accepted, and Sir William Jones laboured for many years on the work. It was unfinished at the time of his death; but has since been completed under the superintendence of Mr. Colebrooke. The laws of Manu, on which the whole system of Hindoo jurisprudence is founded, were translated by Sir William Jones, and published separately in 1794. Those who are interested in Hindoo literature are also indebted to Sir William Jones for a translation of *Sacuntalâ*, a dramatic poem by *Câlidâsa*, which appeared for the first time at Calcutta in 1789 [*CÂLIDÂSA*]; and also for a translation of the *Hitopadâsa*, which appears to have been the original of the celebrated collection of Persian fables known under the name of *Pilpay* or *Bidpai*. But while he was indefatigable in the pursuit of literature, he never neglected his duties as a judge; and "the inflexible integrity," remarks Lord Teignmouth, "with which he discharged the solemn duty of this station, will long be remembered in Calcutta, both by Europeans and natives." He died at Calcutta, on the 27th of April 1794, after a few days' illness.

A mere catalogue of the writings of Sir William Jones would show the extent and variety of his knowledge. He had a wonderful facility for the acquisition of languages; his knowledge of Latin and Greek was extensive, though not profound; his acquaintance with Arabic, Persian, and Sanskrit has seldom been equalled, and scarcely, if ever, surpassed by any European; he was familiar with Turkish and Hebrew; and had learned enough of the Chinese to enable him to translate an ode of Confucius. He was also well acquainted with most of the modern languages of Europe,—French, Italian, Spanish, Portuguese, and German; and had studied less critically numerous other languages. His knowledge of science was not so extensive or accurate: he had however made some progress in mathematics; was well acquainted with chemistry; and had studied botany during the latter years of his life with the greatest diligence. But though the attainments of Sir William Jones were so various and extensive, he does not appear to have possessed much originality. He neither discovered new truths nor placed old ones in a new light. He possessed neither the power of analysing nor of combining and constructing. For language, as a science, he did nothing: he only collected materials for others. His writings on Oriental literature are interesting and instructive; but neither they nor any of his other works are distinguished by originality of thought or power of expression; his style is weak, and his judgment frequently defective. His literary attainments were certainly such as few men, perhaps none, have ever made; yet with every disposition to admire and honour him for what he has done, we cannot assign him a high intellectual rank. Doubtless he weakened his powers by diffusing them over so large a surface, instead of concentrating them on a few objects. His personal character must always command our respect; he was an indefatigable scholar, an affectionate son, a faithful friend, a useful citizen, and an upright judge.

In addition to the works which have been already mentioned, Sir William Jones published a translation of *Isæus*; and also translations of two Mohammedan law tracts 'On the Law of Inheritance, and of Succession to Property of Intestates;' 'Tales and Fables by Nizami;' 'Two Hymns to Præcriti;' and 'Extracts from the Vedas.'

A complete edition of the works of Sir William Jones was published in 6 vols. 4to, 1799, and in 13 vols. 8vo, 1807, with his life by Lord Teignmouth.

JONSON, BENJAMIN, was born at Westminster in the year 1574, and educated at Westminster School, where Camden was his master, as he mentions in the dedication of 'Every Man in his Humour.' Jonson's father had died just before his son's birth. His widow about two years afterwards married a second husband, by trade a bricklayer, and when Jonson became of sufficient age to be employed, he worked at his father-in-law's business. According to Fuller, he soon left it and went to the University of Cambridge, but was obliged from necessitous circumstances speedily to return, and was employed in the new structure of Lincoln's Inn. According to Wood, some gentlemen who saw him working with his father took compassion on him, and he was sent by Camden to Sir Walter Raleigh, whose son he attended on his travels on the Continent. On his return he went to Cambridge. According to another account, before going to Cambridge he served

as a soldier in the Low Countries, and the statement seems to be confirmed by one of his own epigrams. The fact is, that the early part of his life is quite uncertain, though it is well known that on leaving Cambridge he betook himself to the stage, where he proved but an indifferent actor and at first an indifferent author. While a retainer to the stage he had the misfortune to kill a man in a duel, and was committed to prison, where the visits of a Roman Catholic priest converted him to the Church of Rome. Twelve years afterwards he returned to the Church of England.

It was in the year 1598 that his fame rose by the production of the comedy of 'Every Man in his Humour,' at the Globe Theatre, and from this time he adopted the practice of writing a play a year, for several successive years. 'Every Man out of his Humour' was acted at the Globe; 'Cynthia's Revels,' which the author has called not a comedy, but a comical satire, was performed by the children of Queen Elizabeth's chapel, as was also another comical satire, 'The Postmaster.' This last piece was occasioned by a quarrel with Decker, who is satirised under the name of Crispinus. Decker retaliated by a play entitled 'Satiromastix,' in which Jonson appears under the title of Young Horace. Jonson's tragedy of 'Sejanus' was produced in 1603, and his noble play of 'Volpone' appeared two years afterwards. About this time he was committed to prison with Chapman and Marston, the three poets having written the comedy of 'Eastward-hoe' (printed in Dodsley's collection), which contained some reflections on the Scots. They were in danger of losing their ears and their noses, but were soon pardoned and released. It is said that Jonson's mother intended to poison herself, if the punishment had been inflicted. Being much occupied with court masques, in the writing of which he had acquired great celebrity, Jonson did not produce another play (in the strict sense of the word) till 1609, when his 'Epicæne' was acted, which is regarded by Dryden as a perfect comedy. The 'Alchemist' appeared in 1610, and though more deservedly reckoned one of the best of his works, was no great favourite with the public. Its ill success is ascribed by some to a party raised against him. Dryden has supposed that the 'Alchemist' was written in imitation of a piece called 'Albumazar' (in Dodsley's collection), but the style and general conduct of the two pieces are so very different that there scarcely seems a reason for supposing any imitation other than the mere circumstance that both plays satirise pretended adepts. In 1611 appeared the tragedy of 'Catiline,' in which the long speeches translated from Cicero and Sallust called forth animadversions, which were disregarded by the author, as he gloried in plagiarisms which served to exhibit his learning. After the production of 'Bartholomew Fair' in 1614, and the 'Devil is an Ass' in 1616, he published his works in folio, and soon after retired to live in Christchurch, Oxford, whither he had been invited by several members. In 1619 he became poet laureate, and received an annual stipend of 100*l.* and a tierce of Spanish wine. The condemnation of 'The New Inn,' which he produced in 1625, nearly disgusted him with the stage, though he afterwards wrote 'The Magnetic Lady' and 'The Tale of a Tub,' which are considered inferior productions. He appears to have suffered much from poverty in the latter part of his life. He died on the 6th of August 1637, and was buried three days afterwards in Westminster Abbey. His monument, inscribed "O Rare Ben Jonson," is familiar to every person who has visited the Abbey.

Jonson's plays are well adapted to the perusal of earnest students, who will find in them a mine of sterling though often rugged beauty; but those will be disappointed who look to his works for the amusement of a passing hour. In the first place it requires a suitable education to enable a person to relish his imitations of the classic authors; and in the second, his plays do not so much represent human character generally, as mankind under the particular circumstances of Jonson's own time, and many local allusions are made which cannot be understood without some knowledge of the manners and customs of the time: but Mr. Gifford's notes in his edition of Jonson are a treasure of this kind of information. The practice of exhibiting the "humours," that is, the peculiarities of character, obtained for Jonson the name of the "humorous" poet, which name must be understood in a sense quite different from that in which it is used at present. The lovers of a more natural school of poetry are seldom admirers of Jonson, who finds his chief readers among those who like to observe the elaboration of dramatic art. Besides his completed dramatic works, Jonson has left two fragments, 'Mortimer's Fall,' which he intended to be a tragedy in the Greek style, and the 'Sad Shepherd,' a dramatic pastoral which is one of the gems of early English literature. He has also left a translation of Horace's 'Art of Poetry,' an 'English Grammar' of some merit, and a few poems, collected under the title of 'Underwoods,' some of which are singularly beautiful; as well as a collection of notes in prose, which he entitled 'Timber, or Discoveries, made upon Men and Matter as they have flowed out of his daily reading; or had their reflux to his peculiar Notion of the Times.' These discoveries contain many valuable passages as well as some acute criticism. His 'Conversations with Drummond of Hawthornden,' are noticed under DRUMMOND, WILLIAM. 'Every Man in his Humour' is the only piece of Jonson's that has kept possession of the stage. 'The Alchemist' has been abridged to a farce called 'The Tobaccoist.'

JONSSON, FINN (known also by the Latin name of FINNUS JOHANNES), the historian of the Icelandic Church and literature, was born on the 16th of January 1704 at Hitardal in Iceland, where his father, Jon Haldorson, was minister. After receiving the elements of education from his father, who had formerly been master of the school of Skalholt, he went himself to that school; and in 1725, at the age of twenty-one, passed over to Copenhagen to prosecute his studies at the university. In 1728 he was present at the great fire of Copenhagen, which, among other calamities, inflicted an irreparable loss on Icelandic literature by the destruction of most of the collection of manuscripts formed by his friend and patron Arnas Magnæus, or Magnusson; and in his endeavours to save a portion of this invaluable treasure he neglected to attend to his own wardrobe and library, which were consumed. On his return to Iceland his intention was to become a lawyer, but the death of his uncle, a parish priest, who left behind him a numerous family of small children, led his father to request him to alter his views to the church, that he might bring up the orphans. He obtained the vacant benefice, brought up the family, married himself, and in 1754 was appointed to the bishopric of Skalholt. He was very attentive to the revenues of his diocese, and the account of his episcopate by Péturason is chiefly occupied with his disputes with refractory tenants of church property. He found time also to compose and publish several works in Latin and Icelandic, one of which, the 'Historia Ecclesiastica Islandiæ,' is certain to preserve his name. He died on the 23rd of July 1789 at the age of eighty-five, leaving behind him six children, one of whom, Jon Finsson, succeeded him in the see of Skalholt, and was the last bishop of that diocese, which was abolished at his decease in 1796. Finsson was editor of the 'Landnamabok' and other Icelandic sagas, and founder of the Icelandic agricultural society; and being long resident at Copenhagen, where he was one of the leading members of the Arna-Magnæan Commission for publishing manuscripts saved from the conflagration of 1728, he had also the opportunity of passing through the press his father's 'Historia Ecclesiastica,' to which he made valuable additions.

The 'Historia Ecclesiastica Islandiæ' is in four quarto volumes, closely printed, of which the first was published in 1772 and the fourth in 1778, at Copenhagen. A continuation by Péturason, containing the hundred years from 1740 to 1840, was published in 1841. The original book is a more valuable and interesting one than might be supposed from its title. The history is made to embrace the literary as well as the ecclesiastical affairs of Iceland, and both are treated in so lively and attractive a style that few ecclesiastical histories can be perused with equal satisfaction. To those whose studies lead them to take an interest in the very singular country to which it relates, the 'Historia' is a mine of valuable information, the want of which no other work can supply.

JORDAENS, JACOB, was born at Antwerp in 1594. He was a disciple of Adam van Oort, but was indebted to Rubens, by whom he was employed as an assistant, for the greater part of his knowledge in the art of painting. He was prevented from visiting Rome by an early marriage with Van Oort's daughter, but he diligently copied the best pictures of the great Italian masters to which he could procure access. His pictures are distinguished by powerful, brilliant, and harmonious colouring, as well as knowledge of chiaroscuro. His composition is rich, his touch free and spirited; but he is deficient in elegance and taste: he copied nature as he found it. He died in 1678. Jordaens painted with great facility and rapidity, and being also extremely diligent and living to a great age, his works are very numerous: a great many of the churches in the Netherlands have altar-pieces by him, and his pictures are met with in most collections of any eminence. There is a 'Holy Family' by Jordaens in the National Gallery, but it is by no means one of his best works: he seldom succeeded well in the treatment of subjects of an elevated character.

JORGENSEN, JORGEN, the form of name adopted in his English writings by JÖRGEN JÖRGENSEN, or JÜRGENSEN, a Dane, who assumed and exercised for a time the dignity of Protector of Iceland. Jorgenson, who was born at Copenhagen in 1779, belonged to a family of learned watch-makers. His father, Jörgen Jürgensen, was watch- and clock-maker to the court of Denmark; his elder brother, Urban (born 1776, died 1830), was the author of a quarto volume in Danish on the measurement of time, published at Copenhagen in 1804; his nephew, Louis Urban (born in 1806, and still living), is the author of important works in Danish, French, and German on the art of watchmaking, and also published in English a 'Specification of Chronometers, Thermometers, Watches, &c., made by Urban Jürgensen and Sons' (Copenhagen, 8vo, 1837). Jorgen, who was probably not considered the hope of the family, was at the age of fourteen sent to England, and bound apprentice on board a collier; he subsequently entered the English navy, and is stated to have served as a midshipman. In the year 1806 he returned to Copenhagen, and published in 1807 a small work in Danish on the commerce of the English and Americans in the Pacific, to which he had performed a voyage in an English ship. He soon afterwards set sail in command of a Danish privateer, the 'Admiral Juul,' to make prizes on the English coast; but meeting near Flamborough Head with two English vessels, was obliged to strike, and was sent to London a prisoner of war, but left at large on his parole. At that time, in consequence of the war between England and Denmark, the situation of the inhabitants of Iceland, who mainly

depended even for subsistence on the supplies from the mother-country, was extremely pitiable and precarious. At the suggestion of the ambidextrous Jorgenson, a Mr. Phelps, a London merchant, freighted a vessel with barley-meal, potatoes, and salt, and a small proportion of rum, tobacco, sugar, and coffee, with a view of trading to the island, and obtaining in return a cargo of tallow, which he understood to be lying in the ports ready for exportation to Denmark. Jorgenson embarked as interpreter, and by leaving England without permission broke his parole. In January 1809 the expedition arrived at Reikiavik, the capital of Iceland, but found that in spite of the necessities of the inhabitants, all trading with foreigners was prohibited by the Danish resident authorities on pain of death. The ship, the *Clarence*, was furnished with a letter of marque, and on this provocation commenced hostilities, which speedily induced the Danish authorities to modify their views, and consent to permit a trade which they could not openly hinder. They still however threw obstacles in the way of traffic by threats in private to the Icelanders. Jorgenson went to England to communicate the state of affairs, and in his absence, Count Trampe, the governor of the island, who had been absent at Copenhagen during the earlier transactions, arrived at Reikiavik on the 6th of June, and not long after concluded a formal convention with the captain of an English sloop of war, the *Rover*, that British subjects should be allowed a free trade in the island during the war, but should be subject at the same time to Danish laws. On the 21st of June another ship from England, the *Margaret and Anne*, made its appearance in Reikiavik harbour, with Mr. Phelps himself on board, and Jorgenson, who acted as his adviser. The English merchant must have been of a somewhat fiery disposition, for after waiting for two or three days in vain for the promulgation of the convention between Count Trampe and the *Rover*, he determined to put an end to the existing state of affairs by his own authority. On Sunday afternoon, the 25th, a party of twelve of the sailors from the *Margaret and Anne* landed, with the captain, and went to the governor's house, took Count Trampe prisoner, and conveyed him to the ship, without resistance from any one—the Icelandic congregations in the streets appearing singularly indifferent to the fate of their ruler. The next day, June 26th, appeared two proclamations issued by Jorgen Jorgenson, which must not a little have startled the quiet burghers of Reikiavik. "All Danish authority ceases in Iceland," was the first clause of one; "Iceland is free, and independent of Denmark," of the other. "Iceland has its own flag; Iceland shall be at peace with all nations, and peace is to be established with Great Britain, which will protect it."

In a third proclamation dated the 11th of July, further explanations were given. "It is declared," so runs the document, "that we, Jorgen Jorgenson, have undertaken the government of the country with the name of protector, until a regular constitution is established, with full power to make war or conclude peace with foreign powers; that the military have nominated me their commander by land and sea to preside over the whole military department of the country; that the Icelandic flag shall be blue, with three white stockfish thereon, which flag we undertake to defend with our life and blood." The military force here spoken of consisted of eight men, Icelanders by birth, and some of them liberated from the prisons, at the head of whom Jorgenson exercised undisputed sway over an island of fifty thousand inhabitants, whose ancestors had been remarkable for their turbulent and warlike character. The ease with which the revolution was effected and maintained was probably owing in the main to a feeling of satisfaction on the part of the Icelanders at the change. The lower classes who, in spite of their literary tastes, scorn to make themselves acquainted with the Danish language, regarding it as inferior to their own, are said to have studied English with some assiduity during the protectorate of Jorgenson. The oppressive laws of the Danes with regard to commerce pressed heavily on the poor. The upper classes were conciliated by Jorgenson's ejection from office of all but native Icelanders, to whom he, though himself a Dane, declared that office properly belonged. The clergy were courted by a promise of increase of salary, and at the annual meeting of the synod the bishop and most of the priests signed a document by which they gave in their adhesion to the new authorities. Jorgenson's financial measures were the most objectionable part of his proceedings. He ordered a confiscation of Danish property, and went about the island with five of his military force, making seizures, which wear the appearance of sheer robbery. With this exception he seems to have avoided any recourse to violence, although in his proclamations he sometimes talked of severe measures, which he was careful not to put in practice. The best account which we have of his proceedings is that in the travels of Sir William Jackson Hooker, the present superintendent of Kew Gardens, who went to Iceland in the *Margaret and Anne*, and to his own personal observations of the course of affairs had the advantage of adding the perusal of two manuscript narratives of the events, one by Count Trampe, the other by Jorgenson, with both of whom he was personally acquainted. In a short history of the transaction in Danish, published by Skulason, an Icelander, in 1832, the writer's attention is chiefly directed to the vindication of his countrymen from the charges of pusillanimity or disaffection to Denmark, for their making no resistance to the usurper; and he

alleges that the inhabitants of Iceland were only kept under by the sad certainty that, as their capital was built of wood and lay under the guns of the *Margaret and Anne*, it might in a few minutes be set on fire and destroyed, when the consequences of destitution and want of shelter in a climate such as that of Iceland, would have been frightful to contemplate. That the inhabitants were in general not satisfied with the state of affairs was shown by their application to the captain of an English sloop of war, the *Talbot*, which unexpectedly made its appearance in Havnford, to control the proceedings which were going on at Reikiavik. This captain, the Honourable Alexander Jones, sailed for the capital, instituted an examination into the whole affair, heard the statements of Count Trampe, who was still a prisoner on board the *Margaret and Anne*, and on the 22nd of August restored the government into the hands of the Danish authorities. He at the same time sent both Trampe and Jorgenson to England, to make what statements they pleased to the authorities in London. So ended the most important political event in the annals of Iceland for several centuries; "a revolution," says Hooker, "in which only twelve men were engaged, not a life was lost, not a drop of blood was shed, not a gun fired, nor a sabre unsheathed." Count Trampe on his arrival in England appealed to the Icelandic sympathies of Sir Joseph Banks, who had nearly forty years before travelled in the country; and an order in council was issued directing that during the war not only Iceland, but the *Feröe* Islands and the parts of Greenland which had Danish settlements should be unmolested by English cruisers, and the trade between them and the mother country should be left free—an excellent and humane measure, the spirit of which might have been imitated with advantage in our recent Russian war. Jorgenson, who on his arrival in England was left at liberty to take up his quarters at his usual lodgings at the *Spread Eagle* in Gracechurch Street, commenced his correspondence with the Admiralty without any allusion to the fact that he was a prisoner of war who had broken his parole; but the circumstance soon oozed out, and he was in consequence arrested and confined in Tothill-Fields Prison, and soon after transferred to the hulks at Chatham. After a twelvemonth there he was allowed to reside at Reading, again on his parole, and in 1811 he put forth an English work on the state of Christianity in Otaheite. At the conclusion of the war he made a tour on the continent, the fruits of which were 'Travels through France and Germany in the years 1815-17. By J. Jorgenson, Esq.,' London, 8vo, 1817. In this work, which is not deficient in vivacity and observation, it is curious that he enters into an elaborate eulogy of the English treatment of prisoners of war, which he maintains was always marked by an excessive degree of lenity and kindness, even in the case of persons who, having broken their parole, were necessarily deprived of the indulgences granted to others. He mentions that he was led to make these observations by the false and malignant statements on the subject which he found in circulation in France, and he adduces numerous facts in support of his views. Jorgenson appears to have taken up his residence in England on his return from Germany, and to have rapidly gone downwards, pursuing a course of dissipation which led to utter ruin. In May 1820 the former Protector of Iceland was tried at the Old Bailey Sessions for stealing articles from his lodgings in Warren-street, Fitzroy-square. He was convicted and sentenced to seven years' transportation. It is stated in the Sessions Papers that "the prisoner made an exceeding long and unconnected defence," and "complained of improper administration of justice in this country." The sentence was not carried out. After a confinement which lasted till towards the end of 1821 Jorgenson was liberated on condition of leaving England. He failed to do so, and was again arrested on a charge of being unlawfully at large, when he pleaded guilty, and received sentence of death. This sentence was again commuted to transportation for life, but he still remained in Newgate acting as an assistant in the infirmary till October 1825, when he was sent off to New South Wales. Our impression is that he died not long after his arrival in the colony, but a search for a mention of the fact has proved unsuccessful. Soon after his departure from England appeared the last publication which bears his name, 'The Religion of Christ is the Religion of Nature. Written in the Condemned Cells of Newgate, by Jorgen Jorgenson, late Governor of Iceland' (London, 8vo, 1827). In this work he gives it to be understood, without directly stating it, that he was a sincere Christian till his thirtieth year (the year, it may be remarked, of the Icelandic revolution), that his belief was then undermined by the perusal of Gibbon's 'Decline and Fall,' and that from that time he was lost to all sense of principle till his conversion in Newgate. The book was reviewed with high commendation in the 'Gentleman's Magazine.'

JORTIN, JOHN, D.D., was born in 1698 in London, but was of foreign extraction, his family having left France when Louis XIV. revoked the edict of Henri IV., commonly called the Edict of Nantes, for the protection of his Huguenot subjects. Jortin had his grammar education at the Charterhouse, whence he passed to Jesus College, Cambridge, of which he became in due time a Fellow. Whilst living at Cambridge he published a small volume of Latin poems, which are greatly admired, and allowed to possess a high rank among modern Latin verses. His college presented him to a living in Cambridgeshire, but he determined on leaving the country and residing in London, where he soon became an admired and popular preacher. His sermons

many of which are printed, are distinguished for their excellent sense and the originality at once of thought and style. In 1751 he obtained the living of St. Dunstan-in-the-East. His other church preferment was the living of Eastwell in Kent, presented to him by the Earl of Winchelsea. This was for the greater part of his life all the preferment he enjoyed; but in 1762, when his friend Dr. Osbaldeston became bishop of London, Jortin was appointed his domestic chaplain, and was presented with a prebend in the church of St. Paul and the living of Kensington. To these was soon added the archdeaconry of London. He fixed his residence at Kensington, where he died in 1770, and was buried in the new churchyard of that place.

The critical writings of Dr. Jortin are greatly admired by all who have a taste for curious literature. It is not merely on account of the learning which is displayed in them, and the use which is made of obscure authors, but there is a terseness in the expression, and a light playful satire in the thoughts, which render them very entertaining. The first work of this class was published in 1731, and is entitled 'Miscellaneous Observations on Authors, ancient and modern.' In 1751 the first volume appeared of his 'Remarks upon Ecclesiastical History,' and in 1758 he published his 'Life of Erasmus.'

JOSEF or JOSEPH I., King of Portugal. [PORTUGAL, in GEOG. DIV.]

JOSEPH I., of the house of Austria, Emperor of Germany, succeeded his father Leopold I. in 1705. He carried on the war called that of the Spanish Succession, which had begun under his father, against Louis XIV. The allied armies under Eugene and Marlborough were prosperous in his reign. The battles of Ramillies, Oudenarde, and Malplaquet, the deliverance of Turin by Prince Eugene, the surrender of Naples to the Austrians, and the permanent footing obtained by the Archduke Charles in Spain, seemed to have nearly decided the question, when Joseph died of the small-pox in April 1711, leaving his brother Charles, afterwards Charles VI., the last male heir of the house of Habsburg, to conclude the war. Joseph was a good prince; he was learned and assiduous in the discharge of his duties, humane, and though a devoted Roman Catholic, yet tolerant.

JOSEPH II., eldest son of Maria Theresa and of Francis of Lorraine, was elected King of the Romans in 1764, and in the following year, on the death of his father, he became emperor. As long as his mother lived he had little real power, as Maria Theresa retained the administration of her vast territories in her own hands; but on her decease in 1780 he became possessed of all the hereditary Austrian dominions. Joseph soon displayed considerable ambition mixed with much restlessness; he was however kept in check by France and by Frederick of Prussia. After the death of Frederick in 1786, Joseph joined Catharine of Russia in a war against Turkey, which his general Laudon carried on with success, taking Belgrade and other fortresses in 1789. But the threatening aspect of affairs in France and Brabant arrested the progress of the Austrian armies, and Joseph himself died in 1790. The character in which Joseph is chiefly viewed is that of a reformer—in many instances a wise one, but in others rash and inconsiderate. He abolished all separate jurisdictions, and divided the Austrian monarchy into thirteen governments subdivided into circles, all under a uniform administration, civil and judicial. He abolished feudal servitudes, and substituted a fixed tax in lieu of corvées, taskworks, tithes, heriots, &c. He issued the edict of toleration, by which all Christians of whatever denomination were declared equally citizens, and equally eligible to all offices and dignities. Wherever there was a population of 3000 inhabitants, whether Protestants or Greeks, they were allowed to build a church for themselves, provided they established at the same time a permanent fund for the support of the minister and relief of the poor. The Jews were allowed the exercise of all trades and professions, with access to the public schools and universities. He took away from the clergy the censorship of the press, and gave it to a commission of literary men resident at Vienna. He opened colleges and universities, enlarged those already existing, endowed new professorships, and collected libraries. He encouraged manufactures, but, according to the old system, he placed exorbitant duties on foreign articles. He subjected the monastic fraternities to diocesan jurisdiction, and he suppressed many convents; but he did it in a harsh manner, without regard to the necessities and feelings of the older inmates, who were turned adrift into the world with only small pensions, and in some cases even without them. He forbade pilgrimages and processions, prohibited the pomp of funeral ceremonies, declared marriage to be a purely civil contract, forbade all papal bulls to be published throughout his dominions without the permission of the government, abolished the privileges of the University of Louvain, and established a new theological seminary in its place. These innovations, in a country so strongly attached to its old institutions and religion as the Belgian provinces were, led to an insurrection, and ultimately to the separation of those fine territories from the Austrian monarchy. His scheme of establishing the German as the universal language throughout his dominions led to a revolt in Hungary, which his more temperate successor Leopold had some difficulty in pacifying. In short, Joseph, with all his liberality, was perfectly despotic in carrying his measures into effect, without regard to the feelings, prejudices, or interests of individuals.

JOSEPHUS, FLAVIUS, the celebrated Jewish historian, was born at Jerusalem A.D. 37. His family was one of very distinguished rank; by his mother's side he was descended from the Asmonean princes,

and his father Matthias belonged to the chief sacerdotal family of the first of the twenty-four courses. Josephus was brought up at Jerusalem with his brother Matthias; and, according to his own account, he made such progress in learning that he was frequently consulted at the age of fourteen concerning difficult points in the law. At the age of sixteen he resolved to become acquainted with the opinions of the three principal Jewish sects, namely, those of the Pharisees, Sadducees, and Essenes. He accordingly studied the doctrines of each; but having heard that a celebrated Essene of the name of Bannus lived in an ascetic manner in the desert, Josephus joined him in his solitary mode of life, and passed three years in his society. At the age of nineteen he again returned to Jerusalem, and embraced the opinions of the Pharisees. In his twenty-sixth year he sailed to Rome with the view of obtaining the liberation of some priests of his acquaintance, who had been seized by Felix, procurator of Judaea, and sent as captives to Rome. He had the misfortune to be shipwrecked in the Adriatic; but upon arriving at Puteoli he became acquainted with an actor of the name of Aliturus, through whose means he was introduced to Poppæa, the wife of Nero, who procured the liberation of the priests, and bestowed many presents upon Josephus.

On his return to Jerusalem, Josephus found the greater part of his countrymen preparing for war against the Romans. Being strongly opposed to this measure, he joined himself to that party which was anxious for the preservation of peace. After the defeat of the Roman general Cestius, and the massacre of the Jews in Syria and Alexandria, all hope of peace appears to have been lost; and Josephus accordingly united himself to the war party. Being deputed, together with Joazar and Judas, to defend the province of Galilee, he made vigorous preparations against the Romans, though his plans were constantly thwarted, and his life frequently in danger from his personal and political enemies. On the approach of Vespasian's army in the following year, A.D. 67, Josephus retreated to Jotapata; and after defending the city for forty-seven days against the whole Roman army, he was taken prisoner on the capture of the town; but instead of being put to death, as was the fate of all his companions, he was received by Vespasian with distinguished honour, in consequence of his pretending to the character of a prophet, and artfully predicting that Vespasian would shortly succeed Nero in the government of the Roman empire. He was present with Titus at the siege of Jerusalem, and endeavoured to prevail upon his countrymen to submit to the Romans. After Vespasian succeeded to the purple, he was treated by Titus with still greater honour than before; but by the Jews he was regarded as a renegade, and by the Roman soldiers was looked upon with suspicion. On the taking of the city, Titus offered to grant him anything he wished. He asked for the sacred books, and the lives of his brother and fifty friends. He received a large estate in Judaea; and upon going to Rome was admitted to the privileges of a Roman citizen by Vespasian, who also gave him an annual pension and apartments in his own house. After the death of Vespasian, he continued to live in Rome in high favour with Titus and Domitian. The time of his death is uncertain; he was certainly alive at the latter end of the first, and probably at the beginning of the second, century.

The first work published by Josephus was the history of the 'Jewish War'; it was originally written in the Syro-Chaldaic language for the use of those Jews who lived beyond the Euphrates. He afterwards translated it into Greek for the benefit of the learned Romans. The 'Jewish War' consists of seven books, and gives an account of the history of the Jews from the taking of Jerusalem by Antiochus Epiphanes to the destruction of the city by Titus. Many years afterwards, in 93, Josephus published in Greek his great work on the 'Antiquities of the Jews,' with the view of increasing the reputation of his nation with the Romans, and of refuting the many calumnies in circulation against the Jews, by giving a faithful account of their history and opinions. This work commences, in the same manner as the book of Genesis, with the creation of the world; and it gives a consecutive account of Jewish history from the birth of Abraham to the commencement of the war with the Romans. The early part is taken from the books of the Old Testament, with many additions and explanations; some of which were probably genuine Jewish traditions, but the greater part appear to have been only added by the historian in order to give more importance to his nation, and a greater air of probability to the miraculous occurrences in Jewish history. The 'Antiquities of the Jews' consists of twenty books, and was dedicated to Epaphroditus, a philosopher at Rome.

Josephus also wrote 'Two Books against Apion,' in reply to those Greeks who questioned the truth of the early part of his work on the 'Antiquities of the Jews.' He likewise published an account of his own life in answer to Justus, who had written in Greek an account of the Jewish war, in which he attacked the character of Josephus.

The best editions of Josephus are by Hudson, Oxf., 2 vols. folio, 1720; Havercamp, Amst., 2 vols. folio; Oberthur, Leip., 3 vols. 8vo, 1782-85; Richter, Leip., 6 vols. 12mo, 1826-27; and Dindorf, Paris, 1845. The works of Josephus have been frequently translated into most of the modern languages of Europe: the best translation in French is by Gillet, Paris, 4 vols. 4to, 1756; that in Italian by Angiolini, Verona, 4 vols. 4to, 1779. There are several German translations: one by J. B. Ott, Zürich, 1736; another by J. F. Cotta,

Tübingen, 1736; and the 'Jewish War,' by J. B. Frise, Altona, 2 vols. 8vo, 1804-5. The English translations are—that published at Oxford, 1676, and London, 1683; by L'Estrange, 1702; and by Whiston, 1737. This last has been often reprinted, and is the version in common use, but it is so extremely inaccurate as to be almost worthless: an infinitely superior version in all respects is that by the late Dr. Robert Trull, edited (with numerous valuable notes) by Mr. Isaac Taylor.

JOSHUA (in the Septuagint Josephus, Acts vii. 45, and Hebr. iv. 8, he is called 'Iyosós), the son of Nun, who succeeded Moses in the command of the Israelites. Joshua, whose original name was Hoshea (יְהוֹשֻׁעַ, Numb. xiii. 8, 16), accompanied his countrymen from Egypt, and distinguished himself by his courage and military talents in a war with the Amalekites (Exod. xvii. 9-13). He was sent, together with several others, to explore the Promised Land, and was the only one of the spies, with the exception of Caleb, who exhorted his countrymen to invade Canaan (Numb. xiv. 6-9, 38). In consequence of this he received especial marks of favour from God, and was nominated by Moses, on the express order of God, to succeed him in the command of the Israelitish army (Numb. xxvii. 18-23; Deut. iii. 28; xxxi. 23). Joshua led the Israelites over the Jordan, B.C. 1451; and in the course of seven years conquered the greater part of Palestine, and assigned a particular part of the country to each of the tribes. He died at the age of 110, and was buried at Timnath-Serath, in Mount Ephraim (Josh. xxiv. 29, 30). We learn from Josephus that Joshua commanded the Israelites for twenty-five years ('Antiq.,' v. 1, sec. 29).

The author of the Book of Joshua and the time in which it was written are equally uncertain. Many critics have supposed that it was written by Joshua himself; but the entire book in its present form could not have been written by him, for many parts of the book refer to events which happened after the death of Joshua (Josh. iv. 9; xv. 13-19, compared with Judg. i. 10-15; Josh. xvi. 10, with Judg. i. 29; Josh. xix. 47, with Judg. xviii. 29). Many critics suppose the book to have been written by Samuel or Eleazar, whose death is recorded in the last verse of the book. Lightfoot ascribes it to Phinehas, the son of Eleazar, and De Wette to the time of the Babylonish captivity. But at whatever time it may have been written, the author appears to have compiled the greater part, if not the whole, of the work from very ancient documents, some of which were probably drawn up by Joshua himself. The survey of the conquered country is expressly said to have been "described in a book" (Josh. xviii. 9); and Joshua is also said to have written "in the book of the law of God" the renewal of the covenant between God and the people of Israel (Josh. xxiv. 26). The Book of Jasher, which has long since been lost, is quoted in Joshua (x. 13) as a work of authority. In Josh. v. 1, the author appears to quote the exact words of a document written by a person who was present at the events recorded.

The Book of Joshua is a continuation of the Book of Deuteronomy, and gives an account of Jewish history from the death of Moses to that of Joshua. It may be divided into three parts, of which the first contains the history of the conquest of the southern and northern parts of Palestine (chaps. i.-xi.), and a recapitulation of the conquests both of Moses and Joshua (ch. xii.); the second part gives a description of the whole of Palestine (ch. xiii.), and an account of the land which was allotted to Caleb and each of the tribes (chaps. xiv.-xxii.); the third part contains an account of the dying address, death, and burial of Joshua (chaps. xxiii., xxiv.). The canonical authority of this book has never been disputed. In all the manuscripts of the Old Testament it immediately follows the Pentateuch.

Many Christian commentators consider Joshua to have been a type of Christ; but this opinion is not supported by any writer of the New Testament.

The Samaritans have two books which bear the name of Joshua. I. One of these is a chronicle, consisting of forty-seven chapters of Jewish history from a little before the death of Moses to the time of the Roman emperor Alexander Severus. It appears to have been called the Book of Joshua, because the history of Joshua occupies the greater part of the work (the first thirty-eight or thirty-nine chapters). It is written in the Arabic language, in Samaritan characters. Copies of this work are extremely scarce. The only copy in Europe, as far as we are aware, is in the University Library at Leyden, to which it was left by Joseph Scaliger. 2. The other Book of Joshua, written by one Abul-Phatah, is also a chronicle of events from the beginning of the world to A.H. 898 (A.D. 1492). There is a copy of this work in the Bodleian Library at Oxford. Schnurrer, who possessed another copy, has given an account of the chronicle in the ninth volume of the 'Repertorium für Bibl. und Morgenl. Litt.'

(The Introductions of Eichhorn, Jahn, De Wette, Augusti, and Horne; Rosenmüller, Scholia; the best critical works on Joshua are by Masius, *Josue Imperatoris Historia illustrata*, Antwerp, 1574; Meyer, *Über die Bestandtheile und die Oekonomie des B. Josue*, with a review of the same book in Berthold's 'Journal der Theolog. Litt.', vol. ii., pp. 337-366; Herwerden, *Disputatio de Libro Josue*, Groning., 1826; Maurer, *Commentar. über d. B. Josue*, &c.)

JOSIAH, King of Judah, was the son of Amon, and succeeded his father in B.C. 639, when only eight years old. After a minority of eight years, during which he was educated, and the affairs of the state were administered, by the high-priest, he began to purge the land of

its idolatries, to restore the true worship, and, supported by the friendship of the king of Assyria, he even extended his reforms into the kingdom of Israel. In the eighteenth year of his reign he commenced the restoration of the Temple, and during its progress Hilkiah discovered the Book of the Law. On hearing the predictions against the Jews he rent his clothes, and sent for Huldah the prophetess, who confirmed the prediction, but added, as Josiah had not consented to these sins, he should not see the calamities. Josiah continued his religious reforms vigorously, and celebrated a solemn passover. Soon afterwards Necho, king of Egypt, who had invaded Assyria, arrived at Carchemish, when Josiah advanced against him, prompted probably by his friendship for the king of Assyria. Necho sent ambassadors to him, saying, "I come not against thee, but against the house where-with I have war, for God commanded me to make haste. Forbear thee from meddling with God, who is with me, that he destroy thee not." Josiah however persisted, a battle took place at Megiddo, in which he was slain, after reigning thirty-one years. During his reign lived the prophet Jeremiah, who, it is stated, lamented for Josiah and Zephaniah. Jehoahaz, his son, succeeded Josiah.

*JÓSIKA, MIKLÓS, or NICHOLAS, an eminent Hungarian novelist, was born at Torda, in Transylvania, on the 28th of April 1796, and belongs to one of the first families of the country. He bears the title of Baron, and has often been confounded by German and other writers with another Baron Jósika, of the name of Samuel, who took a distinguished part in the transactions of the Transylvanian Diet. Nicholas Jósika entered the Austrian army in 1811, and served in the campaigns of 1814 and 1815, but retired in 1818, after the peace, with the rank of captain; married an heiress, and for some time resided on his estates in Transylvania, and at a town-house in Pesth, giving his chief attention to literary pursuits. In 1836 he published a national and historical tale, 'Abafi,' founded on the history of the Transylvanian prince of that name in the 17th century. Its popularity was great and instantaneous. The reviewer in the 'Figyelmező,' the most influential critical journal, began his criticism with the words "Uraim! le a kalapokkal" ("Gentlemen, off with your hats"). In the course of the ensuing twelve years, up to the revolution of 1848, Jósika's pen was in such constant activity that his romances amounted to about sixty volumes. As in the case of other prolific writers, there was a decided falling-off in his later productions, nor did he ever produce a novel which could compete with the 'Village Notary' of Eotvos [Eotvos], but he continued, and still continues, a favourite with the Hungarian public. His chief romances are—'Abafi,' his first and best; 'Az utolsó Bátor' ('The last Bátor'); 'A' Csehek Magyarországbán' ('The Bohemians in Hungary'); 'Zrinyi a' Költö' ('Zrinyi the Poet'), founded on the adventures of the poet, who was descended from the famous Zrinyi, the defender of Sigeth; and 'Jósika István' ('Stephen Jósika'), in which the hero was one of his own ancestors. His attempts as a dramatic poet, which were repeated three or four times, met with little success. As a parliamentary speaker in the upper house of nobles he was also considered to have failed, owing, in some measure, to a shyness which he could never shake off in public. He took however a bold and decided part in the revolution in support of the measures of Kossuth, was named a member of the committee for the defence of the country, and followed the government to Debreczin and Arad. After the catastrophe at Vilagos he succeeded in making his way over the frontier, but was condemned to death for contumacy, and in September 1851 was hanged in effigy with Kossuth, and thirty-five others at Pesth. Since 1850 he has lived at Brussels, where his death in law has not prevented him from being the acknowledged foreign correspondent of 'A' Magyar Hirlap,' an Hungarian newspaper. In 1851 a romance from his pen appeared at Brunswick, entitled 'Egy Magyar Csalad' Forradalom alatt' ('A Magyar Family during the Revolution'). None of his works have yet appeared in English, though many have been translated into other languages, and the whole into German, partly by Klein and partly by his second wife, Julia Jósika, born Baroness Podmaniczky, one of the most gifted ladies in Hungary, whom he married in 1847. Jósika is himself the translator into Hungarian of the English novel by the author of 'Trevelyan,' 'A Marriage in High Life,' which is a favourite in several foreign languages.

JOSQUIN, DEPREZ—the name which it appears to us, after having collated various authorities, is the true one of this celebrated composer of the most ancient school of part-music—was, there seems little reason to doubt, a native of the Low Countries, though the honour of his birth is indirectly claimed by many Italian writers, and was born about the middle of the 15th century. Josquin was a disciple of Johann Ockenheim, "the oldest composer in parts on the Continent," says Dr. Burney, "of whose works I have been able to find any remains," and much of whose reputation arises from his having been the instructor of one who became so eminent. It is probable that Josquin went into Italy when young, and there improved himself in the knowledge of his art; and this may have led to his having been thought a native of that country, a supposition to which the frequent addition to his name of Pratenis, or Del Prato (a town in Tuscany), may be attributed. It is certain that he was a singer in the pontifical chapel in the time of Sixtus IV. (1471 to 1484), for Adami speaks of him in that capacity in high terms, as well as of his compositions, calling him "uomo insigne per l'invenzione." Quitting Italy, he was,

according to Glareanus, appointed *Maitre de Chapelle* to Louis XII, for whom he composed much music (concerning which some amusing stories are told), and a motet or two so contrived that the monarch was enabled to take a part in the performance. Louis had made him a promise of a benefice, but neglected to redeem it. To remind the king, the composer wrote a motet beginning 'Memor esto verbi tui,' &c. This not producing the intended result, Josquin wrote another, upon the words, 'Portio mea non est in terra viventium.' Louis then took the hint, bestowed a benefice, and the composer expressed his gratitude in a third motet, commencing, 'Bonitatem fecisti cum servo tuo, Domine.' But Glareanus remarks that desire proved more inspiring than gratitude, for the two first works very much surpassed the last.

The time of Josquin's decease is not known: he was buried in the church of St. Gudule, at Brussels. He was a very voluminous composer, and many of his works remain to attest his learning and genius. Hawkins gives a good specimen of them; Burney more than one example; and several are to be found in the British Museum. "He may," says Dr. Burney, "be justly called the father of modern harmony, and the inventor of almost every ingenious contexture of its constituent parts."

JOTHAM, King of Judah, succeeded his father Uzziah, or Azariah, in B.C. 757. He followed the righteous example of his father, though the high places were not altogether removed, and his reign of sixteen years appears to have been a comparatively peaceful one. No events are recorded in the Scriptures; but it is stated that "in those days the Lord began to send against Judah, Rezin, the king of Syria, and Pekah, the son of Remaliah, king of Israel;" but these troubles appear to have fallen upon Jotham's son, Ahas, who succeeded him in B.C. 741. The prophets Hosea, Isaiah, and Micah lived during the reign of Jotham.

JOURDAN, JEAN-BAPTISTE, Marshal of the French empire, was born at Limoges, on the 2nd of April 1762. His father, a poor country surgeon, being able to afford him but a limited education, Jourdan took service in the French army sent to aid the Americans in the War of Independence, with which he continued to serve from 1778 to 1782. In that year he returned to France with shattered health; and, intending to renounce the career of a soldier, he in 1784 married a young milliner rather older than himself, and opened a haberdasher's shop in his native town. But at the outbreak of the revolution he entered the army again as a volunteer, in December 1791—was raised by his comrades to the rank of major shortly after—was promoted to a brigade on the 27th of May 1793—and on the 21st of July following became a general of division. After the battle of Hondchoote, Houchard having been recalled to Paris, Jourdan was made commander-in-chief in his place. He was then ordered to attack the Austrian forces before Maubeuge, and raise the blockade of that place. In this he was assisted by Carnot, who, during the three days that the contest lasted, vied with Jourdan in charging the imperialists. During this action the adjacent village of Wattignies was taken and retaken three times by the French and allied forces; but at length it remained in the hands of the French: the allies retired behind the Sambre, and the blockade of Maubeuge was raised—a result most important to the French republic. After the battle of Wattignies, Carnot and Duquesnoy, the representatives, so extolled the talents of Jourdan in their despatches to the Convention, that public opinion placed him in the first line of republican generals, a prestige which lasted many years. Nevertheless, having been summoned to Paris by the Committee of Public Safety, to give his advice on the future operations of the French armies, he embarrassed the government by the frankness of his opinions; and Barere, having praised his honesty and patriotism, but regretted his want of energy, Pichegru was appointed to succeed him.

Jourdan returned to his trade at Limoges, but was soon after summoned to the army of La Moselle, to replace General Hoche, whom Saint Just had sent to prison to await his trial. Then for a few months followed that series of successes which forms the basis of Jourdan's reputation as a commander. In May 1794 he defeated the Austrian general Beaulieu, at Arlon; he crossed the Meuse at Dinant on the 3rd of June, captured Charleroi on the 25th, and on the 29th won the battle of Fleurus—the most important victory obtained by the republic before the campaigns of Napoleon. On the 18th of September he defeated Clairfait at the combat of Ayvaile; and on the 2nd of October he obtained another victory over the Austrians at Juliers, or Jülich, on the Roer. In these achievements he was supported by a number of generals, some of whom have since exceeded him in reputation; for Moreau, Bernadotte, Kleber, Moreau, Ney, and Soult, then fought under his command. Within a week after the victory of Juliers, the whole of Jourdan's army of the Sambre-et-Meuse was encamped on the left bank of the Rhine, from Coblenz to Clèves. Landrecies, Lequesnoy, Condé, and Valenciennes had been recovered; besides which, Charleroi, Namur, Juliers, and Maestricht had yielded to the French arms. The fine provinces watered by the Rhine had increased the territories of the republic, and remained under the government of France for upwards of twenty years. In 1795 Jourdan made himself master of the fortress of Luxembourg, crossed the Rhine on the 6th of September in presence of 20,000 Austrians, and compelled the garrison of Düsseldorf to capitulate.

In 1796 he once more crossed the Rhine, obliged the Austrian general Wartensleben to retreat, captured Frankfurt and Würzburg, and advanced towards Ratisbon; but here was the turning-point in his fortune. The Archduke Charles, adopting the tactics of Napoleon, prepared to attack the separate French armies with his united forces; and, encountering Jourdan at Amberg, drove him off the field with great loss. On the 3rd of September the archduke engaged him at Würzburg, and routed his army, after which Jourdan was completely disabled. Early in 1797 he resigned his command, and returned to Paris, where he was elected a member of the Council of Five Hundred, of which he became president on the 23rd of September. Being appointed to command the army of the Danube in 1798, he was defeated by the Archduke Charles at the battle of Ostrach, on the 20th of March 1799; and a few days after at Stockach, with so great a loss as obliged him to make a precipitate retreat through the passes of the Black Forest. On the 10th of April his command was transferred to Massena. He was re-elected a member of the Five Hundred, from which he was dismissed after the 18th Brumaire for refusing to join the conspiracy of Bonaparte.

For the next twelve years Marshal Jourdan was employed in no important operation; but he received his bâton on the 19th of May 1804, at the first creation of the marshals of the empire. At the battle of Vittoria, June 21st, 1813, he rather accompanied than commanded the army of Joseph, king of Spain, which was defeated by Wellington. On the 3rd of April 1814 he gave in his adhesion to the provisional government: and in 1815 presided over the court-martial which was to have tried Marshal Ney, but which declared itself incompetent. In 1818 Louis XVIII. called him to the Chamber of Peers. He died on the 24th of November 1833, and was buried with great pomp in the *Hôtel des Invalides*.

JOUVENCY, PIERRE, was born at Paris in 1643. He studied at Caen, and afterwards at La Flèche, with considerable success, and was at an early age admitted a member of the Society of the Jesuits. He devoted himself chiefly to history, and is the author of the fifth part of the 'History of the Jesuits,' from 1591 to 1616, which was published at Rome in 1710. Though an agreeable writer, from the purity and elegance of his style, his facts are not to be implicitly relied on. So bigotedly was he attached to his order, that he has written an apology of the Jesuit Guignard, who was executed in the reign of Henri IV. of France, on account of his participation in the attempt made against the life of that monarch by Jean Châtel, who had been incited to commit the crime by the seditious writings of Guignard. An abridgement of his history was published at Liege in 1716, which is now rarely to be met with. The other works of Jouveney are—1, A Collection of Latin Harangues, pronounced by him on different occasions (his Latinity, though it has been blamed by Vallart, is generally admired); 2, a treatise, 'De Arte Descendi et Ascendi,' which is in some esteem, but considered too superficial; 4, 'Appendix, de Diis et Heroibus Poeticis,' a useful abridgment of mythology; 5, a Collection of Notes on Horace, Persius, Juvenal, Martial, and the 'Metamorphoses' of Ovid, which is considered his most valuable production. He died at Rome in 1719, while engaged in the continuation of the 'History of the Jesuits.'

JOUVENET, JEAN, a celebrated French painter during the reign of Louis XIV., was born at Rouen in 1644. He was first instructed by his father Laurent Jouvenet, but completed his studies in Paris, where he soon attracted the notice of Lebrun, who in 1675 procured him his election into the Academy of Painting for a picture of 'Esther before Ahasuerus,' which is one of the best paintings of the Academy collection. Jouvenet had obtained considerable distinction two years previously by his picture of the 'Lame Man healed,' which was the so-called May Picture (*Le Tableau du Mai*) of 1673. The May Picture is a painting which was formerly presented on the 1st of May of every year to the Virgin, in the cathedral of Notre Dame, by the Goldsmiths of Paris: the practice ceased in 1708. Jouvenet became successively professor, director, and perpetual rector of the Academy, and he was granted a small pension by Louis XIV. Jouvenet's last work, the 'Visitation of the Virgin,' or 'Le Magnificat,' in the cathedral of Notre Dame, was painted with his left hand in 1717. He had a paralytic stroke in 1718 and lost the use of his right hand, but upon the first trial he found his left as obedient to his will as his right had been; one of the many proofs that, in art, it is the mind rather than the hand that requires the education. He died in 1717.

The French boast of Jouvenet, as of Le Sueur, because he never visited Italy; and it is for the same reason, according to some, that he is censured by Count Algarotti, who, they say, had no faith in an excellence that could be acquired out of Italy. The works of Jouvenet are not brilliant in any respect or even attractive, yet they possess all the greater merits of a picture in more than an ordinary degree. His style resembles that of Nicolas Poussin, especially in composition and colour; and he excelled in light and shade, but in expression he was never great.

There are ten of Jouvenet's pictures in the Louvre, some of which are his best works, as the 'Miraculous Draught of Fishes,' the 'Resurrection of Lazarus,' the 'Sellers driven from the Temple,' 'Christ in the House of Simon the Pharisee,' and the 'Descent from the Cross.' The first four have been worked in tapestry of the Gobelins, and they have all been engraved, as have also nearly all Jouvenet's best works,

by some of the best French engravers—by H. S. Thomassin, J. Audran, E. Picard, L. Desplaces, A. Loir, A. Trouvain, and others. There are works by Jouvenet in many of the churches of Paris, mural and easel pictures. Of his mural paintings the principal are the colossal frescoes of the Apostles painted on the dome of the church Des Invalides.

JOUY, VICTOR-JOSEPH-ETIENNE, DE, was born in the hamlet of Jouy, near Versailles, in the 1769. When only thirteen he accompanied the governor of French Guyana as sous-lieutenant to that colony, but remained there scarcely a year. He returned to Versailles, continued his education for two years, and then left France a second time for the French East Indian possessions as an officer in the Luxembourg regiment. In 1790 he was again in France, joined the revolutionary party, and rapidly attained military promotion; but during the Reign of Terror became suspected, and fled to Switzerland. On Robespierre's fall in July 1794 he returned to Paris, was placed on the staff of the army of Paris under General Menou, and contributed to the triumph of the Convention in the streets of that city on the 21st of May (2nd Prairial) 1795. Very shortly afterwards he was arrested; then released, and sent as commander to Lille; then again arrested on an accusation of being in communication with Lord Malmesbury the English minister, but acquitted and restored to his functions. Disgusted however with these repeated persecutions he resolved to abandon his military career; he therefore solicited his discharge, which he obtained together with a pension for his good services and wounds. He was now thirty years old, and after a few months' service in a civil capacity at Brussels, he took up his abode at Paris and devoted himself to literature. His first efforts were some vaudevilles, written in conjunction with Messrs. Delonchamp and Dieulafoy; but his first great success was the opera of 'La Vestale,' the music by Spontini, which gained him admission to the Academy in 1815. This was followed by several other operas, among which were 'Les Amazones,' with music by Mehul, and 'Les Abencerrages,' with music by Cherubini, which still retain possession of the stage. He also wrote comedies, both in prose and verse, with considerable success; and several tragedies, of which 'Sylla' obtained a marked success. The work however on which his reputation mainly rests is 'L'Hermite de la Chaussée d'Antin,' a series of essays on men and manners in France, which first appeared in the 'Gazette de France,' in 1813-14, and were afterwards collected and published in five volumes, 12mo, 1815. They were considered in France as the successful rivals of the English 'Spectators,' 'Guardians,' and 'Ramblers.' They no doubt have considerable merit, the style is easy, the observation acute, the description animated, and the characters often drawn with much quiet humour. They may exhibit some resemblance to the essays of Addison or Steele, but none whatever to those of Johnson. They display with sufficient accuracy the surface of society, but they have little depth. Some attempts are made at the pathetic, but they are rather maudlin. They were however very successful in France, and the author followed up his success by the 'France Parleur,' 'L'Hermite de la Guyane,' 'L'Hermite en Province,' the last a collection by several writers, but all infinitely inferior to the first. 'L'Hermite en Prison,' however, and 'L'Hermite en Liberté,' written in 1823 and 1824, in conjunction with M. Jay, were of a better kind, and were received with much applause by the liberal party in France. M. Jouy has also written on political economy, and likewise two novels, 'Cecil,' and 'Le Centenaire,' in 1827 and 1833. He edited for some time the 'Journal des Arts,' and he contributed innumerable articles to various newspapers and journals. He died at Paris in October 1846.

JOVELLA'NOS, GASPÉR MELCHIOR DE, was born at Gijon in the Asturias, in 1749. Although of noble lineage, being nephew to the Duke of Losada, he possessed but a moderate patrimony; accordingly, as soon as he had completed his studies at the universities of Oviedo, Avila, and Alcalá, he accepted the appointment of magistrate at Seville. In 1778 he was made chief judge of the King's Court at Madrid, in which city he became acquainted with Cabarrus, Campomanes, and other eminent literary characters. Through the machinations of court intrigue, he was afterwards removed, but was recalled, and raised to the more important office of minister of grace, or home-secretary of state; to retain it however only for a few months, when the influence of Godoy expelled him. He now returned to Gijon, where his cares were directed towards the 'Instituto Asturiano,' which he had succeeded in establishing in 1794, and for which he had set apart a considerable portion of his official emoluments. But he was not allowed to pursue his plans for public instruction long, since in about two years and a half afterwards he was arrested, and sent as prisoner to Majorca, where he was confined in the castle of Bellver. Even during this period, which continued upwards of seven years, he prosecuted his studies as diligently as circumstances would permit, and commenced a 'Flora Bellverica,' and collected materials for a history of the island. At length, after the downfall of Godoy, he was permitted to return by Ferdinand VII., and on that sovereign's abdication, was chosen member of the central junta. When that body was dissolved, Jovellanos returned to Gijon, to be shortly after driven from his home when the French invaded Asturias, in 1812, and he died within two months afterwards.

As a writer on subjects of political economy and legislation, Jovel-

lanos stands foremost among his countrymen; but besides his productions of that class, he wrote his celebrated 'Pan y Toros,' the tragedy of 'Pelayo,' the comedy of 'El Delincuente Honrado,' a translation of the first book of 'Paradise Lost,' besides several poetical pieces; an éloge on Ventura Rodriguez, the eminent architect; a dissertation on English architecture, &c. A biographical memoir of Jovellanos was published by his friend Ceán Bermudes, under the title of 'Memorias para la Vida del Excmo. Sen. Don G. Jovellanos, y Noticias analíticas de sus Obras.'

JOVIANUS, FLAVIUS CLAUDIUS, born A.D. 331, was the son of Veronianus, of an illustrious family of Mœsia, who had filled important offices under Constantius. Jovianus served in the army of Julian in his unlucky expedition against the Persians, and when that emperor was killed, in 363, the soldiers proclaimed him his successor. His first task was to save the army, which was surrounded by the Persians, and in great distress for provisions. After repelling repeated attacks of the enemy, he willingly listened to proposals for peace, which were—that the Romans should give up the conquests of former emperors westward of the Tigris, and as far as the city of Nisibis, which was still in their hands, but was included in the territory to be surrendered up to Persia, and that moreover they should give no assistance to the king of Armenia, then at war with the Persians. These conditions, however offensive to Roman pride, Jovianus was obliged to submit to, as his soldiers were in the utmost destitution. It is a remarkable instance of the Roman notions of political honesty, that Eutropius reproaches Jovianus not so much with having given up the territory of the empire, as with having observed so humiliating a treaty after he had come out of his dangerous position, instead of renewing the war, as the Romans had constantly done on former occasions. Jovianus delivered Nisibis to the Persians, the inhabitants withdrawing to Amida, which became the chief Roman town in

Mesopotamia. On his arrival at Antioch, Jovianus, who was of the Christian faith, revoked the edicts of Julian against the Christians. He also supported the orthodox or Nicene creed against the Arians, and he showed his favour to the bishops who had formerly suffered from the Arians, and especially to Athanasius, who visited him at Antioch. Having been acknowledged all over the empire, Jovianus, after staying some months at Antioch, set off during the winter to Constantinople, and, on his way, paid funeral honours to Julian's remains at Tarsus. He continued his journey in very severe cold, of which several of his attendants died. At Ancyra he assumed the consular dignity, but a few days after, being at a place called Dadastana in Galatia, he was found dead in his bed, as some say being suffocated by the vapour of the charcoal burning in his room, according to others by the steam of the plaster with which it had been newly laid, whilst others again suspected him to have been poisoned or killed by some of his guards. He died on the 16th of February 364, being thirty-three years of age, after a reign of only seven months. The army proclaimed Valentinianus as his successor.

JOVINUS, born of an illustrious family of Gaul, assumed the imperial title under the weak reign of Honorius, and placing himself at the head of a mixed army of Burgundians, Alemanni, Alani, &c., took possession of part of Gaul, A.D. 411. Ataulphus, king of the Visigoths, offered to join Jovinus and share Gaul between them, but Jovinus having declined his alliance, Ataulphus made peace with Honorius, attacked and defeated Jovinus, and having taken him prisoner at Valence, delivered him to Dardanus, prefect of Gaul, who had him put to death at Narbo (Narbonne) in 412.

Coin of Jovinus.

JOVIUS, PAUL. [Giovio.]

JUAN I., King of Castilla and Leon, was born August 20th, 1358, at Epila, in Aragon. He was the son of Henrique II., and succeeded his father May 30th, 1379. On the death of Fernando I., king of Portugal, he laid claim to the throne of that kingdom in right of his wife Beatriz, daughter of Fernando. The Portuguese however had chosen for their king a natural son of Pedro I., who became Joam I. of Portugal. Juan I., in support of his claim, invaded Portugal with a large army;

but was defeated with great loss, August 14th, 1335, at Aljubarota, a village in Portuguese Estremadura. This victory secured the crown of Portugal to Joam I. Juan I. died October 9th, 1390, in consequence of having been thrown from his horse in a tournament.

JUAN II., King of Castilla and Leon, was born March 6th, 1405. He was the son of Henrique III. He succeeded to the throne of Castilla on the death of his father, December 26th, 1406; and was crowned at Segovia, January 15th, 1407. His mother Catharine, daughter of the Duke of Lancaster, and his uncle Fernando, king of Aragon, became his guardians, and regents of the kingdom of Castilla during his minority. His uncle died in 1416 and his mother in 1418. In 1420 he married his cousin Maria, daughter of his uncle Fernando of Aragon, which afforded an opportunity to her two brothers, Don Juan and Don Henrique, to interfere in the affairs of the young king of Castilla, and led to several conspiracies. Juan II. was of weak character, but his favourite minister, Don Alvar de Luna, managed the business of his kingdom with success, till, on some accusation brought against him, he was beheaded in 1453 at Valladolid. Juan II. died July 21st 1454, and was succeeded by his son, Henrique IV.

JUAN I., II., Kings of Aragon and Navarra. [ARAGON, in GEOG. DIV.]

JUBA I., son of Hiempsal, king of Numidia, succeeded his father about the year B.C. 50. He was a warm supporter of the senatorial party and Pompey, moved, it is said, by a gross insult which in his youth he had received from Cæsar. He gained, B.C. 49, a great victory over Curio, Cæsar's lieutenant in Africa. After the battle of Pharsalia, and the death of Pompey, he continued steady to his cause; and when Cæsar invaded Africa, B.C. 46, he supported Scipio and Cato with all his power, and in the first instance reduced the dictator to much difficulty. The battle of Thapsus turned the scale however in Cæsar's favour. Juba fled; and finding that his subjects refused to receive him, put an end to his life in despair. His connection with Cato has suggested the underplot of Addison's tragedy.

Coin of Juba I.

British Museum. Actual size. Silver.

JUBA II., the son of Juba I., was carried to Rome by Cæsar, kindly treated, and well and learnedly educated. He gained the friendship and fought in the cause of Augustus, who gave him the kingdom of Mauritania, his paternal kingdom of Numidia having been erected into a Roman province. He cultivated diligently the arts of peace, was beloved by his subjects, and had a high reputation for learning. He wrote in Greek of Arabia, with observations on its natural history; of Assyria; of Rome; of painting and painters; of theatres; of the qualities of animals; on the source of the Nile, &c. Juba married Cleopatra, the daughter of Antony and Cleopatra, queen of Egypt. Their medal, which is here given, has IVBA REX on one side, and ΚΛΕΟΠΑΤΡΑ ΒΑΣΙΛΙΣΣΑ on the other. Strabo in his 6th book speaks of Juba as living, and in his 17th and last book as then just dead. This would probably fix his death about A.D. 17. (Clinton, *Past*; Dion Cass.; Cæsar, *Bell. Civ.*; Pliny, *Hist. Nat.*, lib. v. 1, &c.; see the Abbé Sevin, *Sur la Vie et les Ouvrages de Juba*, in *Acad. des Inscriptions*, vol. iv., p. 457.)

Coin of Juba II.

British Museum. Actual Size. Silver.

JUDAS MACCABÆUS succeeded his father Mattathias (B.C. 166) as the leader of the Jews in their patriotic attempts to throw off the yoke of the Syrian kings (1 Macc. iii. 1.) He greatly distinguished himself in the war by his military talents, his personal courage, and his implacable hostility to the Syrian princes. Immediately after his father's death he defeated two Syrian armies, and in the following year conquered Lysias and Gorgias, who had been sent against him with much larger forces. He afterwards took possession of Jerusalem, purified the Temple from all idolatrous pollutions, and restored the national worship. He strengthened his power by subduing the Idumæans and Ammonites and other nations bordering upon Palestine. The unexpected success of Judas greatly exasperated Antiochus, who swore that he would destroy the whole Jewish nation, but he died before he could make preparations for the conquest of the country. He was succeeded by Antiochus Eupator, who marched against Jerusalem, but was obliged to raise the siege and return to Upper Asia in

consequence of a revolt of a powerful noble. Before he left Palestine he entered into an alliance with Judas. This treaty however was soon broken by the Syrian king; fresh armies were sent against Judas, which were all defeated by this intrepid warrior. Anxious to render Judas independent, and feeling the difficulty of continuing the contest against the whole power of the Syrian empire, he sent ambassadors to Rome to solicit an alliance with the Roman people (1 Macc. i. 8; Justin, xxxvi. 3). This was readily granted by the Romans, but before Judas could receive any assistance from his new allies, Palestine was again invaded by a Syrian army of 22,000 men under the command of Bacchides. Judas had only 3000 men with him, and his number afterwards diminished to 800; but with these he ventured to attack the Syrians, and after an obstinate struggle was at length defeated, and perished in the contest (B.C. 160).

JUDE, SAINT. The Epistle of St. Jude, a book of the New Testament, was probably written by the Apostle Jude, who was surnamed Lebbeus and Thaddeus (Matt. x. 3; Mark iii. 18; John xix. 22). He is also called the brother of James (Luke vi. 16; Acts i. 13), and the brother of Christ (Matt. xiii. 55). This James was probably "James the Less," the son of Alphæus and Mary (Matt. x. 3; xxvii. 56; Mark xv. 40), who was also the brother of Christ. The meaning of the 'brother of Christ' has been already discussed under JAMES. It has however been maintained that this epistle could not have been written by the Apostle Jude, since he does not describe himself as an apostle, but, on the contrary, refers to the authority of the apostles as superior to his own (v. 17). (De Wette's 'Lehrbuch,' sec. 182.)

The object of this epistle is to guard believers against the false teachers who had crept into the church, and to exhort them to persevere in their Christian profession. There is a great similarity between this epistle and the second epistle of St. Peter. Hug, in his 'Introduction to the New Testament,' argues, that since "the language of Jude is simple, unpretended, and expressive, without ornament; while that of Peter is artificial, and has the appearance of embellishment and amplification," the Epistle of Jude was written first, and was used by St. Peter in the composition of his second epistle. The Epistle of Jude appears to have been written shortly before the destruction of Jerusalem.

The canonical authority of this epistle has been rejected by many, because the apocryphal books of Enoch and the Ascension of Moses are supposed to be quoted in it (v. 14, 9). It is not contained in the 'Peshito,' and is classed by Eusebius among the 'Antilegomena' ('Hist. Ecc.', ii. 23; iii. 25). Origen also expresses doubts respecting it ('Comment. in Matt.', iii. 814); but the greater number of the Fathers refer to it as a work of divine authority.

JUDSON, ADONIRAM, founder of the American Baptist Mission in Birma, was born August 9, 1788, at Malden, Massachusetts, where his father was a Congregationalist minister. Having passed through the classes of Brown University, where he took honours, he entered the Andover Theological Seminary; and whilst there, a sermon by Dr. Claudius Buchanan, which he chanced to meet with, turned his thoughts towards the missionary service in India. Some fellow-students, to whom he communicated his views, became similarly impressed, and they eventually formally stated to the college authorities their desire to devote themselves to the missionary office. There was then no missionary society in America, but the council referred the matter to a general committee, who resolved that it was advisable to institute a "Board of Commissioners for Foreign Missions." Whilst this board was in process of organisation, young Judson proceeded, in 1811, to England, to consult with the directors of the London Missionary Society. On his way the vessel in which he had embarked was captured by a French privateer and carried into Bayonne, and Judson was released, after a short detention, at the intercession of some of his countrymen. In London he received only qualified promises of aid, but the American board, though as yet without funds, resolved to found a mission in Birma, to which they appointed Judson and three other young students as missionaries.

Having on the 5th of February 1812 married Miss A. Hasseltine, he, twelve days after, embarked with his young wife for India. Four months later they landed at Calcutta, where they met with a warm welcome from Dr. Carey and the Serampore missionaries, but the Bengal government peremptorily ordered Judson and his companions to return to America by the same ship in which they had arrived. Judson however was not disposed to give up his purpose so easily. He accordingly took a passage to the Isle of France, proceeded thence to Madras, and from there to Rangoon, in Birma, where he arrived July 14, 1813.

Before leaving Calcutta, Mr. Judson, whose views on the subject of baptism had undergone a change, was, with his wife, re-baptised by immersion by Dr. Carey. He in consequence resigned his connection with the Board of Missions; and when he landed at Rangoon to commence his missionary work he was unconnected with any society, and without any means of future support. He addressed himself however without delay to the task of acquiring the Birnese language, unaided by dictionary or grammar, whilst the native he engaged as a teacher knew not a word of English. By persevering labour, he in some two or three years was able to speak the language with some degree of readiness. The Baptists of America, on hearing of his devotion, had promptly formed a missionary society to support him, and sent him out some assistants, one of whom was a printer. The

Serampore missionaries presented a printing-press and a fount of Birmanese type. Mr. Judson, now not only engaged in preaching and personally instructing the natives, but desirous to benefit those whom his voice could not reach, drew up in Birmanese a 'Summary of Christian Doctrine,' which was the first work issued from the Rangoon press; and portions of scripture and several tracts followed. As soon as the mission was fairly at work Mr. Judson made visits to other Birmanese towns, and to Ava, where he had an interview with the king; and, having obtained permission, set about establishing schools, in which Mrs. Judson, who had also mastered the language, was a very earnest and successful helper. The mission was going on favourably, when the sovereign of Birma provoked the English to declare war. Rangoon was made a point of attack by the British forces; but before they arrived, Mr. Judson, with the other missionaries, was seized and put into prison. There he remained for several months, subjected the greater part of the time to the most cruel treatment; but at length, when the success of the English was beyond question, he was employed to act as translator for the Birmanese, and Mrs. Judson was sent to the British camp to mediate. A treaty of peace being signed, Mr. Judson and his companions were permitted to resume their labours. He returned to Rangoon; and there, worn out with toil and anxiety, the companion of his early dangers and the sharer of his labours died, October 1826, during his absence in Ava. Some eight years later he married a second wife, the widow of a fellow-missionary named Boardman.

From an early period Mr. Judson had regarded the translation of the Scriptures into Birmanese as the great work of his life; and, after having been for several years engaged upon it, he at length, January 31st, 1834, had the happiness to complete his task. He lost no time in putting it to press, and by the end of 1835 the printing was finished of the first edition, in 3 vols. large 8vo. But he soon became convinced of its many imperfections, and he at once set about thoroughly revising the whole, with such assistance as he could obtain. This revision was completed in the autumn of 1840, and immediately printed in a thick 4to volume. It has since undergone careful correction by various Oriental scholars, and now holds a high place among the translations of the Scriptures into the eastern tongues. Almost as soon as the printing of this revised edition of the Bible was finished, with characteristic energy Judson commenced at Moulmein, whither he had removed, the preparation of a Birmanese Dictionary. But his own ill-health interrupted the work, and the health of his wife failing also, he determined to return to America, in the hope that their native air might restore their vigour. Mrs. Judson died off St. Helena (September 1st, 1845), but he arrived in safety at Boston a month afterwards. His reception by the various religious societies in America was of the most enthusiastic kind. Special services were everywhere got up, and enormous crowds of persons assembled to greet him. His stay however was but brief: he had determined to return, and, if possible, end his days in Birma. But he did not return alone. Anxious to find some one qualified to write a memoir of his second wife (a memoir of the first had already been written), he was introduced to an accomplished young lady, Miss Chubbuck, whose writings under the pseudonym of Fanny Forester had had an unusually large amount of popularity in religious circles; and she not only undertook to write the life of the second Mrs. Judson, but soon consented to become the third. They were married in June 1846; in July they embarked at Boston, and in December they landed at Moulmein. The mission was now in a flourishing state, and Judson felt that he might devote himself to the easier task of supervision, and to the completion of his Dictionary. Of this he was permitted to see the first part printed in 1849, but he did not live to complete it. His health failed, and he was directed to proceed to the Isle of Bourbon to recruit. He embarked, but grew rapidly worse, and died at sea on the 12th of April 1850. His 'Birmanese and English Dictionary' was completed from his papers by Mr. E. A. Stevens, and printed at Moulmein in 1852. It is regarded as a work of great value, and is in fact the only Dictionary that has been compiled of the Birmanese language. With his Birmanese Bible it formed a vast work for one individual to accomplish, in the midst of labours so many and so exhausting as those of the founder and director of an Indian mission. As a Christian missionary, Mr. Judson is regarded with the greatest respect by all sects among his countrymen, and also in England, though of course with especial reverence by the Baptists.

Several Lives of Mr. Judson have been published, of which the chief are those by Clements, Gillette, and Wayland. Memoirs of each of his wives have also been published: one, 'Lives of the three Mrs. Judsons,' having passed through several editions. Each of these ladies was an authoress. Besides various papers for the Birmanese converts, the first Mrs. Judson wrote a 'History of the Burman Mission;' the second wrote poetry; and the third, besides her 'Memoirs of Mrs. Boardman Judson,' wrote, as Fanny Forester, the 'Records of Alderbrook,' a work very popular in America, and more than once reprinted in England; 'The Great Secret;' 'Missionary Biography;' 'The Katabayan Slave,' &c.: she died June 1, 1854.

JUGURTHA, the illegitimate son of Manastabal, by a concubine, and grandson of Masinissa, was brought up under the care of his uncle Micipsa, king of Numidia, who sent him with an auxiliary force to join Scipio Æmilianus, in his war against Numantia in Spain.

Jugurtha so distinguished himself as to become a great favourite with Scipio, who, at the conclusion of the war, sent him back to Africa with strong recommendations to Micipsa. Micipsa adopted him, and declared him joint heir with his own two sons Adherbal and Hiempsal. After Micipsa's death (B.C. 118), Jugurtha, aspiring to the undivided possession of the kingdom, effected the murder of Hiempsal, and obliged Adherbal to escape to Rome, where he appealed to the senate. Jugurtha however found means to bribe many of the senators, and a commission was sent to Africa in order to divide Numidia between Jugurtha and Adherbal. The commissioners gave the best portion to Jugurtha, who, not long after their departure, invaded the territory of his cousin, defeated him, besieged him in Cirta, and having obliged him to surrender, put him to a cruel death; and this almost under the eyes of Scaurus and others, whom the Roman senate had sent as umpires between the two rivals (B.C. 112). This news created great irritation at Rome, and in the following year, under the consulship of Scipio Nasica and Calpurnius Bestia, war was declared against Jugurtha, and an army was sent to Africa under Calpurnius, accompanied by Scaurus, with other senators as his advisers. After some fighting, Jugurtha obtained under most favourable conditions the quiet possession of the usurped kingdom. The treaty however was not ratified at Rome; and Calpurnius being recalled, the new consul Posthumus Albinus was appointed to the command in Africa. Meantime Jugurtha, being summoned, appeared at Rome; but as he then succeeded in bribing several of the senators, and also Bæbius, a tribune of the people, no judgment was given. Jugurtha, emboldened by this success, caused Massiva, son of his uncle Gulussa, whom he suspected of aiming at his kingdom, to be assassinated in the Roman capital. The crime was traced to Jugurtha, but as he was in Rome under the public guarantee, the senate, instead of bringing him to trial, ordered him to leave Rome immediately.

It was then that Jugurtha is said to have exclaimed against the venality of that city, "which would willingly sell itself if it could find a purchaser wealthy enough to bid for it." Posthumus was sent to Africa to prosecute the war, but he soon returned to Rome without having effected anything, leaving the army under the command of his brother Aulus Posthumus, who allowed himself to be surprised in his camp by Jugurtha, to whom he surrendered himself; and his army, having passed under the yoke, evacuated Numidia. The new consul, Metellus, arriving soon after with fresh troops, carried on the war with great vigour, and being himself above temptation, reduced Jugurtha to the last extremity. Caius Marius was serving as lieutenant to Metellus, whom in the year B.C. 107 he supplanted in the command. Jugurtha meantime having allied himself with Bocchus king of Mauritania, continued to give full employment to the Romans. Marius took the towns of Capsa and Moleuca, and in a hard contested battle defeated the two kings. Bocchus made offers of peace, and Marius sent to him his quaestor Sulla, who after much negotiation induced Bocchus to give up Jugurtha into the hands of the Romans as the price of his own peace and security. Bocchus hesitated awhile, but at last, having appointed a conference, he had Jugurtha seized and delivered over to the Romans. Jugurtha followed in chains, with his sons, the triumph of Marius, after which he was thrown into the Mamertine subterranean dungeon, the soldiers having stripped him of all his clothes, and even tore his ears for the sake of the earrings which he wore. He was starved to death in his prison; or, as some say, he was strangled. His two sons were sent to Venusia, where they lived in obscurity. The war against Jugurtha lasted five years; it ended in the year B.C. 106. (Sallustius, *De Bello Jugurthino*; Eutropius.)

JULIANUS, FLAVIUS CLAUDIUS ('The Apostate'), son of Julius Constantius, brother of Constantine the Great, was born at Constantinople, November 17, 331. After Constantine's death, the soldiers massacred the brothers, nephews, and other relatives of that prince, in order that the empire should pass undisputed to his sons. [CONSTANTIUS.] Two only escaped from this butchery, Julian, then six years old, and his half-brother Gallus, then thirteen years of age. Marcus, bishop of Arethusa, is said to have concealed them in a church. After a time Constantius exiled Gallus into Ionia, and entrusted Julian to the care of Eusebius, bishop of Nicomedia. Julian was instructed in Greek literature by Mardonius, a learned eunuch, who had been teacher to his mother Basilina. At the age of fourteen or fifteen he was sent to join his brother Gallus at Maeclitum, a castle in Cappadocia, where they were treated as princes, but closely watched. ('Julian's Opera, Epistle to the Athenians.') The youths were taught the Scriptures, and were even ordained lecturers, and in that capacity publicly read the Bible in the church of Nicomedia. It appears that Constantius had the intention of making a priest of Julian, who had no inclination for that profession, and who is supposed to have already secretly abandoned the belief in the Christian doctrines. The death of Constantius and Constantine having left Constantius sole master of the Roman world, that emperor, who was childless, sent for Gallus, in March 351, and created him Cæsar, and he allowed Julian to return to Constantinople to finish his studies. There Julian met with the sophist Libanius, who afterwards became his friend and favourite. Constantius soon after again banished Julian to Nicomedia, where he became acquainted with some Platonist philosophers, who initiated him into their doctrines. He afterwards obtained leave to proceed to

Athens, where he devoted himself entirely to study. After the tragical death of Gallus, in 365, Julian, who had again for a time awakened the jealous suspicions of his cousin, was recalled to court by the influence of the Empress Eusebia, his constant patroness, when Constantius named him Caesar, and gave him the government of Gaul, which was then devastated by the Gernan tribes, together with his sister Helena to wife. Julian made four campaigns against the Germans, in which he displayed great skill and valour, and freed Gaul from the Barbarians, whom he pursued across the Rhine. He spent his winters at Lutetia (Paris), and became as much esteemed for his equitable and judicious administration as for his military success. Constantius, always suspicious, ordered Julian to send him back some of the best legions in Gaul to be employed against the Persians. When the time for marching came, in the year 360, Julian assembled the legions at Lutetia, and there bade them an affectionate farewell, when an insurrection broke out among the soldiers, who saluted him as Augustus. Julian immediately sent messengers to Constantius to deprecate his wrath, and to claim the title of Augustus, with supreme authority over the provinces in which he had ruled as Caesar. Constantius rejected his proposals, and Julian marched with his legions towards Constantinople. Constantius on his part set out to meet him. But the death of the emperor, November 3, 361, left the throne open to Julian. He proceeded to Constantinople, where, being proclaimed emperor in December 361, he reformed the pomp and prodigality of the household, issued several prudent edicts, corrected many abuses, and established a court at Chalcedon to investigate the conduct of those who had abused their influence under the preceding reign. Unfortunately some innocent men were confounded with the guilty; among others Ursulus, whose condemnation Ammianus (b. xxii.) deplores.

Coins of Julianus.

British Museum. Actual size.

On assuming the purple Julian had openly professed the old religion of Rome and sacrificed as high-priest to the gods, and though at the same time he had issued an edict of universal toleration, he soon showed a marked hostility to the Christians: he took the revenues from the churches, and ordered that those who had assisted in pulling down the heathen temples should reimburse them. This was a signal for a fearful reaction and persecution against the Christians in the provinces, where many were imprisoned, tormented, and even put to death. Julian restrained or punished some of these disorders, but with no zealous hand. There was evidently a determined struggle throughout the empire between the old and the new religion, and Julian wished for the triumph of the former. He forbade the Christians to read or teach others the works of the ancient classics, saying that as they rejected the gods they ought not to avail themselves of the learning and genius of those who believed in them ('Juliani Opera,' Epist. 42, Spanheim's edition). He also forbade the Christians filling any office, civil or military, and subjected them to other disabilities and humiliations. Julian has been called the Apostate, but according to his own statement, he ceased to be a Christian in his twentieth year, and it seems very doubtful whether at any period of his life after his boyhood he had been a Christian in his heart; the bad example of the court of Constantius, and the schisms and persecutions that broke out in the bosom of the church, may, as has been suggested, have turned him against religion itself, while his vanity, of which he had a large share, and which was stimulated by the praises of the sophists, made him probably consider himself as destined to revive both the old religion and the glories of the empire. Yet it was not till he ascended the throne that he publicly avowed his adherence to the ancient faith: thus for at least ten years, by his own account, he dissembled his change of religion. That he was no believer in the mythological fables is evident from his writings, especially the piece called 'The Caesars;' yet he professed great zeal for the heathen divinities, and he wrote orations in praise of the mother of the gods and of the sun. Making every allowance for the difficulties of his position and the effect of early impressions, he may be fairly charged with a want of candour and of justice, and with much affectation bordering upon hypocrisy. If we choose to discard the invectives of Gregory of Nazianzus, of Cyril, and of Jerome, we

may be allowed at least to judge him by the narrative of Ammianus and by his own works, and the result is very far from favourable to his moral rectitude, or sobriety of judgment.

Julian, having resolved on carrying on the war against the Persians, repaired to Antioch, where he resided for several months. His neglected attire, his uncombed beard, and the philosophical austerity of his habits, drew upon him the sarcasms of the population of Antioch. The emperor revenged himself by writing a satire against them, called 'Misopogon;' and, what was worse, by giving them a rapacious governor. He set off on his expedition with a brilliant army, reckoned at 65,000 men, crossed the Euphrates, took several fortified towns of Mesopotamia, crossed the Tigris and took Ctesiphon, but here his progress ended. The close Roman legions were harassed on all sides by the light cavalry of the Persians, and reduced to great distress for want of provisions. Still they presented a formidable front to the enemy, and Sapor, the Persian king, was inclined to come to terms, when in a skirmish between the advanced posts of both armies, Julian, who had run to head his soldiers, neglecting to put on his cuirass, received a mortal wound from a javelin which pierced his side. Being carried to his tent he expired the following night, 26th June 363. He died with calmness and composure, surrounded by his friends, conversing on philosophical subjects, and expressing his satisfaction at his own past conduct since he had been at the head of the empire. His remains were carried to Tarsus in Cilicia, according to his directions, and his successor Jovian erected a monument to his memory.

The works of Julian consist of orations, satires, 'The Caesars,' and about eighty letters, some of which are very interesting. His letter to Themistius contains a treatise on the duties of sovereigns. His narrative of his Gaulish and German campaigns is unfortunately lost. The last and best edition of Julian's works is by Ezech. Spanheim, Leipzig, 1696, fol.; but it does not contain all the letters. A complete edition of the letters was published by L. H. Heyler, Mainz, 1828, 8vo. There is a French translation of Julian's works by La Bletterie, and a Life of him by Tourlet; but the best life of Julian, and a very favourable one, is that by Gibbon in his 'Decline and Fall.'

JULIANUS, SALVIUS, was probably a native of Milan. He was the great-grandfather of the Emperor Didius Julianus. (Ælianus Spartianus, 'Didius Julianus.') Julianus was twice consul, and also Prefectus Urbi. He mentions his own consulship and office of Prætor Urbanus; and he also speaks of having been in Egypt ('Digest' xlii. tit. 2, a. 5; xvi. tit. 3, a. 36). Julianus was a distinguished juriconsult, and one of the Consiliarii of Hadrian; and he may probably have attained the honour of the consulship under this emperor. Lampridius ('Commodus,' c. 3) speaks of the Emperor Commodus soliciting the chastity of a son of Salvius Julianus, and of his putting the father to death; but this cannot be the juriconsult Julianus, who probably died in the reign of Antoninus Pius. The sepulchre of the Juriconsult was on the Via Laticana, five miles from Rome, according to Spartianus; and his descendant the Emperor Didius Julianus was buried in the same tomb. ('Didius Julianus,' c. 8.)

Salvius Julianus was a pupil of Javolenus Priscus, and therefore one of the Sabiniani. His authority was very great among the Roman jurists, and he is oftener cited than any other writer by the Roman jurists, even more frequently than Labeo. The great work with which his name is connected was the 'Edictum Perpetuum,' which was compiled in the time of Hadrian. His principal legal work was Ninety Books of Digesta. There are 457 excerpts from Julianus in the Digest of Justinian, and chiefly from the work just mentioned. There are also mentioned, in the Florentine Index, Six Books Ad Minucium, Four Books Ad Ursicum, and One Book On Ambiguities (De Ambiguitibus).

JULIUS I. succeeded Marcus in the see of Rome in 336. Athanasius having been driven by the Eusebian party from his see of Alexandria, it was agreed by many of the Eastern bishops that the dispute should be settled in a council to be assembled at Rome. The council was convoked in 340, and Athanasius appeared, but not his adversaries, who convened another synod at Antioch, which excluded Athanasius from his see. Julian remonstrated, but in vain. [ATHANASIUS, ST.] The general council of Sardica was next convened, but a schism soon broke out in that assembly, and the parties excommunicated each other. This is the council which is said to have granted to the see of Rome the right of arbitration in cases concerning the deposition of bishops; but this is a point much controverted. Julius died in the year 352. Two letters of his to the Eusebians and the Church of Alexandria are extant (Constant., 'Epistolæ Roman. Pontif.'). Others have been falsely attributed to him, as well as ten decretals, which are spurious.

JULIUS II., CARDINAL DELLA ROVERE, nephew to Pope Sixtus IV., succeeded Pius III. in the year 1503. He had distinguished himself under preceding pontificates by his haughty temper and warlike disposition, which were fitter for the sword than the crossier. After his exaltation to the papal throne he began by driving Cesare Borgia out of his ill-gotten possessions in the Romagna; but there he found another power, the Venetians, who, during the preceding troubles, had taken possession of Ravenna, Rimini, and other places. The Venetians offered to pay tribute to the see of Rome for those territories, but Julius refused, and demanded their absolute restitution to the Church. After fruitless negotiations, Julius, in 1508, made a league with

Louis XII, the Emperor Maximilian, and the Duke of Ferrara, against Venice. This was called the League of Cambrai, and its object was the destruction of the republic of Venice and the partition of its territories. Venice however stood firm, although its armies were defeated and its territories were ravaged by both Germans and French with their usual atrocity. At last Julius himself, having recovered the town of Romagna, perceived the impolicy of uniting with ultramontane sovereigns against the oldest Italian state, and accordingly in Feb. 1510, he made peace with Venice. Wishing to undo the mischief which he had done, and to drive the foreigners, whom he styled "barbarians," out of Italy, he first sought to arm the Germans against the French, whom he dreaded most; but not succeeding, he called to his aid the Swiss. The pope himself took the field against the French in Lombardy, and attacked and took the town of La Mirandola, entering it by a breach, in January 1511. The next campaign was unfavourable to Julius, and he lost Bologna. But in the following October his legates succeeded in forming a league, which he called "holy," with Ferdinand of Spain, Henry of England, the Venetians, and the Swiss. The campaign subsequent, in 1512, was marked by the battle of Ravenna and the death of Gaston de Foix, the French commander, followed by the total expulsion of the French from Lombardy. But this was effected by the Swiss, German, and Spanish troops, and Julius merely succeeded in driving one party of foreigners out of Italy by means of other foreigners, who meantime subverted the republic of Florence, and gave it to the Medici. In the midst of these events, Julius died of an inflammatory disease, on the 21st of February 1513. He was succeeded by Leo X. Julius was fond of the fine arts; he patronised Bramante, Michel Angelo, and Raffaele, and he began the structure of St. Peter's church.

JULIUS III., CARDINAL GIOCCI, succeeded Paul III. in 1550. He re-opened the sittings of the Council of Trent, which had been suspended under his predecessor. He quarrelled with France and with Venice, and also with Ferdinand, king of the Romans and brother to Charles V., and died in March 1555, leaving behind him a very indifferent character, marked by incapacity and misconduct.

JUNGMANN, JOSEF, an eminent Bohemian lexicographer and bibliographer, was born at Hudlitz, near Beraun, on the 16th of July 1778. His father was a peasant, who specially occupied himself with the management of bees, and Jungmann, who early showed a literary turn, had much to struggle with in devoting himself to his favourite pursuits. His example appears to have produced an effect on others of the family, for Antonin, a younger brother, became a physician, and Jan a priest. The German language was introduced into the schools of Bohemia in 1774, and Jungmann, though from his name he was evidently of German descent, and though, as his after life evinced, he had talents for acquiring languages, seems to have felt as a peculiar hardship the necessity he was under of obtaining a mastery of German. He made it the main business of his after life to restore and promote the study and cultivation of the Bohemian language, which, in his boyhood, was almost abandoned to the use of the peasantry, and which, owing in a considerable degree to his exertions, is now the ordinary language of Bohemian authors, who were formerly accustomed to employ either German or Latin. He studied first at Beraun, and then at the University of Prague; and in the year 1799 obtained an appointment as teacher of grammar at the gymnasium, or grammar school, of Leitmeritz, where he devoted part of his leisure to giving gratuitous instruction in Bohemian. While at Leitmeritz he translated several specimens of English poetry—Pope's 'Eloisia,' and 'Messiah;' Goldsmith's 'Edwin and Angelina;' Gray's 'Elegy in a Country Churchyard;' and above all the 'Paradise Lost,' which was completed about 1804, but not published till 1811, and which came to a second edition in 1843, in the 'Nowoceská Biblioteka,' a collection of the Bohemian classics. In 1815 he was transferred to Prague as professor of Latin at the grammar school of the Old-Town, of which, in 1834, he became the prefect, or principal. In 1840 he was chosen rector of the university, an office which was delivered to him by his brother Antonin, who had occupied it the year before, while his brother Jan read high mass as part of the ceremonies. Antonin, who has written several medical works in Bohemian, has also published an essay on the Sanscrit language, and Jan is likewise an author in the native tongue. In 1846 the infirmities of age compelled Josef to retire from the management of the gymnasium, but he was still occupied with correcting works for the press at the time of his death, on the 16th of November 1847. He had for several years been an object of affectionate veneration to the Bohemian public.

Jungmann is the author of two works which are certain to preserve his name. One the 'Slovnik Cesko-Nemecky,' the great Bohemian Dictionary, in five quarto volumes, comprising at least four thousand pages of close print in double columns, is a stupendous monument of zeal and diligence, which the Bohemians proudly place by the side of Johnson and Adelung. The only other dictionary of a Slavonic language which can be compared to it is the Polish of Linde, which is indeed more rich in points of derivation and comparison. In uniformity with its title, 'Bohemian-German Dictionary,' equivalents to the Bohemian words are given in German in this elaborate work, but the main mass of information which it contains is only accessible to the Bohemian scholar, and even the Preface is given solely in Bohemian. This dictionary, which passed through the press between 1835 and 1839,

was published at the expense of the Bohemian Museum, and in an imperial decree which was issued soon after its appearance, it was directed that the orthography adopted by Jungmann should be taken as a standard in the schools of the country. The triumph however was a short-lived one, for already in 1842 the Museum had adopted another system of orthography, to which Jungmann was obliged to conform in other works issued under its auspices, hoping, as he tells us in his 'History of Bohemian Literature,' that this new system might be the last. This 'History' is his other great labour, and it is a most useful compilation to all who take interest in a curious branch of literary research. The first edition, which was issued in 1825, was out of print for several years before the appearance of the second, which Jungmann was engaged upon at the time of his death, and which was published in 1849. It is not so much what its title indicates as a complete Bohemian bibliography. The narrative portion, which is somewhat dry, hardly occupies a tenth part of the work, the remainder is a complete and minute enumeration of every book in the Bohemian language, printed or manuscript, of which Jungmann could acquire information, from those of the earliest period, the manuscripts discovered by Hanka [HANKA], to the year 1846. He even had the patience to form a list of the separate articles in periodicals, so that, with the assistance of very copious indexes, a reader may ascertain in a few minutes, which of the works of Dickens, Scott, and Shakspeare were translated into Bohemian by the year 1846, who were the translators, and when the versions appeared. The miscellaneous writings of Jungmann were collected in one volume, and published by the Bohemian Museum in 1841. They mainly consist of translations from English, French, and German, but there are some essays on the favourite subject of his native language, which are curious in matter and animated in manner.

JUNIUS, FRANCISCUS. There are two learned persons of this name, father and son. The father was a Protestant minister in the Low Countries, best known by a translation of the Scriptures into the Latin tongue, in which he was assisted by Tremellius, whence it is usually called the version of Junius and Tremellius. He became professor of theology at Leyden, where he died in 1603. His son, the younger Francis Junius, of whom we are principally to speak, was born at Heidelberg in 1589, and accompanied his father to Leyden, but soon relinquished study and embraced the profession of arms. On the cessation of hostilities in those countries in 1609 he gave up arms, and betook himself to literature as a profession. He came over to England in 1610, and was soon entertained as his librarian by Thomas Howard, earl of Arundel, a nobleman whose name, whenever it occurs, is found associated with some good deed connected with the higher interests of man. Junius remained thirty years in this honourable connection, during which time, having few distractions and an insatiable appetite for curious knowledge, he accumulated vast stores of information.

The more particular direction of his studies was towards the northern languages, or rather the various dialects of that great language which, under the name of the Gothic or the Teutonic, seems to have been spoken in the remotest ages by the people who inhabited both shores of the Baltic. We owe to him the publication of the most valuable relic of the literature of the people who spoke this language in what may be called its purity, a version of the gospels, commonly called Ulphilas's Version, and the manuscript which contains it, 'The Silver Codex.' This was printed, with many learned notes and other illustrations, in 1665. There is another work of his, published in his lifetime, on the 'Painting of the Ancients,' which is a very useful book. But the work by which he is best known is a posthumous work, not printed indeed till 1743, entitled 'Etymologicum Anglicanum,' in which we have the investigation of the origin of numerous words in the English language, relics of the language spoken by our Saxon progenitors, conducted with a great apparatus of the knowledge required in such an undertaking. It was much used by Johnson.

Junius lived to his eighty-ninth year, dying in 1678 at Windsor, at the house of his nephew, Isaac Vossius, another of the great names in the list of the learned. He had formed a valuable collection of manuscripts, which he bequeathed to the University of Oxford, and they are now among the treasures of the Bodleian Library.

JUNOT, ANDOCHE, DUC D'ABRANTES, was born at Bussy-les-Forges, on the 24th of September 1771, according to the duchess's memoirs, whilst all the biographical dictionaries fix the date in October of the same year. He had begun to study for the law, when the political events of 1791 induced him to enlist in the battalion of volunteers raised in the department of the Côte-d'Or: he soon distinguished himself, and his fellow-soldiers made him a sergeant on the field of one of his acts of daring. In that grade he was serving at the siege of Toulon, when Bonaparte, not yet a general, commanded the artillery, and having discerned the soldierly qualities of Junot, attached him to his person. The capture of the place raised the commandant to a general of brigade, when Junot was made a captain, and became the first aide-de-camp to General Bonaparte. For nearly two years he continued the sole aide-de-camp of General Bonaparte; he is even said to have shared his purse with his superior officer during the few months that he remained unattached, prior to the 13th Vendemiaire (October, 1795).

He accompanied Bonaparte to Italy, in 1796, and was present at

Lodi, Areola, Castiglione, and Lonato, at which last battle he was badly wounded. In 1799, he took part in the campaign in Egypt, when at the combat of Nazareth, with a troop of three hundred horse, he held a body of several thousand Mussulmans in check, till Kléber came to his relief. He greatly assisted Bonaparte on the 18th Brumaire, in overthrowing the Directory. For this timely service, he was made Commandant of Paris, in 1800; married to Mademoiselle du Permon (whose family had long been connected with that of Bonaparte) on the 18th October of the same year; and created a general of division, in 1801. In 1804, he was appointed Governor of Paris. On the 1st of February 1805, he received the title of colonel-general of hussars, besides being decorated with the grand eagle of the Legion of Honour. He was likewise sent on several missions to the Court of Lisbon, his part of ambassador being suddenly changed at last into that of aggressor, when the good understanding between France and Portugal had ceased, in 1806. Junot then took forcible possession of Portugal, and held his ground there for nearly two years, when Sir Arthur Wellesley's victory at Vimiera, on the 21st of August 1808, and the conclusion of the Convention of Cintra, nine days after the battle, was followed by the evacuation of Portugal by the French army, and Junot's return to Paris. He had already received his title as Duc d'Abrantes; but from this period he lost all favour with Napoleon, having no chief command entrusted to his orders. In 1812 he was directed to join the grande armée, and the 8th corps was ostensibly placed under his command, but the orders from Berthier were transmitted rather to his lieutenants than to himself, and the only time his name was mentioned in a bulletin, he was reflected upon as having shown "a want of resolution." Under this reproach his spirit sank; he was refused employment in the campaign of 1813, and shortly after, was attacked with mental disease. In this state he was conveyed to the house of his father, at Montpellier, on the 22nd of July 1813; the following day he threw himself out of a window, broke one of his thighs, and it became necessary to amputate the leg. He died on the 28th.

Laura Permon, Duchesse d'Abrantes, was born at Montpellier, November 6, 1784, and was only sixteen when married to Junot, in 1800. She was a woman of great frankness of speech, and equally remarkable for the prodigality of her expenditure. As a consequence she made enemies at court, during her husband's life, and when his death and the fall of Napoleon had turned the tide of her fortune, she had no savings to support herself and family. She therefore had recourse to her pen for her subsistence. She wrote many tales and novels; but her principal work was her 'Mémoires au Souvenir historiques sur Napoleon,' published in 1831. As these memoirs contained many incidents relating to the early life of the French emperor, its success was universal throughout Europe. The Duchesse d'Abrantes died in extreme poverty on the 7th of June 1838.

JÜRGENSEN. [JØRGENSEN.]

JURIEU, PIERRE, was born in 1637, and was the son of a Protestant minister at Mer, in the diocese of Blois, and nephew of the celebrated Rivet and Du Moulin. When of age to enter the ministry, he succeeded his father in his pastoral office. His reputation for learning afterwards obtained for him the situation of Professor of Theology and the Hebrew language at Sedan. When in 1681 the Protestants were deprived of the permission to give public instruction in that town, he retired to Rouen, and from thence went to Rotterdam, where he was appointed Professor of Theology. In that city the ardour of his zeal soon drew him into controversy with Bayle, Saunage, and Saurin; in the heat of which he manifested the same rancour which unfortunately disgraces most of his polemical writings. He allowed himself likewise to fall into various errors by too much indulging a naturally lively imagination in the interpretation of prophecy. In his 'Commentary on the Apocalypse' he even predicted the establishment of Protestantism in France during the year 1686. Those who differed from him in opinion, however high their character for learning and piety, he treated with a most unbecoming severity. Grotius and Hammond, perhaps the two greatest theologians of their age, because they differed from him on the subject of the Antichrist predicted in the book of Revelations, he styles, "the disgrace of the Reformed Church, and even of Christianity." The same spirit is manifested in his well-known controversy with Bossuet, bishop of Meaux, whom he does not scruple to accuse of falsehood and dishonesty, though, on the other hand, it must be allowed that the recriminations of this celebrated defender of the Church of Rome, if more politely expressed, are equally severe and destitute of truth; the great object of Bossuet being, it would appear, to charge his antagonist with holding the heretical opinions of Socinus. (Bossuet, 'Hist. des Variations,' vol. iv. p. 64; v. pp. 236-238.) With all these defects, Jurieu stands deservedly high as a controversialist. His learning was most profound, he is generally exact in the citation of his authorities, and he had a special talent in discovering the weak point in the cause of his antagonists. In respect of style and eloquence he is immeasurably behind Bossuet, but he is at least his equal in polemical talent, and by some is considered his superior in erudition. Jurieu's private life was becoming that of a Christian minister; he was charitable to the poor almost beyond his means, and he employed the great influence he possessed with the foreign courts in alleviating the sufferings of his exiled brethren. He died at Rotterdam on the 11th

of January 1713. His works, which are very numerous, were extremely popular in their day, and many of them are still held in high estimation by theologians of every school, on account of the great learning which they display. The principal of them are—1. 'A Treatise on Devotion.' 2. 'Defence of the Morality of the Reformed Church,' Hague, 1685, in answer to a work by Arnauld entitled 'Morality destroyed by the Calvinists.' 3. 'A Preservative against Change in Religion,' which was written to refute Bossuet's Exposition of the Catholic Faith.' 4. 'Letters against the History of Calvinism by De Maimbourg,' 2 vols. 5. Another collection of controversial letters, entitled 'The last Efforts of Oppressed Innocence.' 6. 'A Treatise on the Church:' he considers it composed of all Christian societies who hold the common principles of the Christian faith. This treatise is sometimes accompanied by a Reply to Nicolle, who had written a work in refutation of it. 7. 'A History of the Doctrines and Worship of the Jews,' Amsterdam, 1704, with a Supplement published in 1705. 8. 'A Treatise on Mystical Theology,' composed on the occasion of the well-known controversy between Fénelon and Bossuet.

JUSSIEU, ANTOINE LAURENT DE, an eminent French botanist, was born at Lyon in 1748, and arrived at Paris in 1765 for the purpose of completing his education as a medical practitioner. He was then placed under the care of his uncle, Bernard de Jussieu, at that time one of the demonstrators of botany in the Jardin du Roi, a man possessing a profound knowledge of plants, and who probably gave his nephew the first interest in the science which he subsequently illustrated with so much success. In the year 1770, his medical studies having been completed, he took the degree of Doctor of Medicine, on which occasion the title of his thesis was, 'An œconomiam vitalem inter et vegetalem analogis,' a subject which sufficiently marks the turn his studies had already taken. In the same year he was nominated botanical demonstrator in the Jardin du Roi, as a substitute for Lemonnier, whose duties as chief physician to the king prevented his executing that office in person. Thus at the early age of twenty-two years Jussieu found himself under the necessity of undertaking the duty of teaching students the essential characters of the plants cultivated in the Paris Garden—a task for which experience in details and practical knowledge were required, rather than that general acquaintance with botany which a young man just released from his medical curriculum might be expected to possess. This obliged him to study one day the subjects to be demonstrated the next, and to occupy himself incessantly with acquiring a correct practical acquaintance with plants. At that time the collection of plants in the Jardin du Roi was arranged according to the method of Tournefort; but shortly afterwards it became necessary to rearrange it. Of this opportunity Jussieu took advantage; he drew up a memoir upon a new method of arrangement, which was read before the Academy of Sciences, and afterwards carried into effect in the garden. The idea of this method was undoubtedly taken from a classification of the plants in the Royal Garden of Trianon, executed under the direction of his uncle; but it was different in much of the details, and was prepared without consultation with Bernard de Jussieu, who in fact was at that time old, nearly blind, ill, and incapable of taking part in any mental exertion. Previously to this, young De Jussieu had studied the natural order *Ranunculaceæ* with so much attention, that he made it the subject of a communication to the Academy of Sciences, in whose 'Transactions' it was printed. In after-years he used to say that it was the composition of this memoir which had opened his eyes to the real principles of botanical classification and made him a botanist. It is here that is found the first distinct trace of those clear ideas concerning the relative importance and subordination of characters which the author subsequently applied to the whole vegetable kingdom. In reality there is no natural order of plants altogether so well suited for this purpose as that which happened to be selected.

From this time, that is, from the year 1774 to 1789, De Jussieu was constantly occupied in demonstrating to his class of botany; and as his new method was thus brought perpetually before him, with all its advantages and disadvantages in practice, he was able to alter and improve it yearly. The distinctions of genera, their mutual relation, the natural sequence of his orders, and in addition all that was written by other botanists during this period, became so familiar to him, that his own records, his having actually commenced his great work, the 'Genera Plantarum,' in 1788, without having prepared more than the commencement of the manuscript; and he adds that he was seldom, during the printing, above two sheets in advance of the compositors; a very remarkable circumstance, if the extreme attention to clearness and arrangement conspicuous in this work are borne in mind. It is however always to be remembered that in these days botany was very different to what it now is, several thousand genera being now included in general works which were unknown to Jussieu.

This extraordinary work made its way slowly. At the time of its appearance the greater part of botanists were full of zeal and prejudice in favour of the sexual system of Linnæus; an idea prevailed that botany was merely the art of distinguishing one thing from another; and moreover the political state of Europe was most unfavourable to scientific investigations. As tranquillity was restored in France the work of Jussieu began to be studied, and being studied it soon became the text-book of all the botanists of reputation in that country. But

in the other nations of Europe it was otherwise. In England, when Dr. Robert Brown published his 'Prodromus Floræ Novæ Hollandiæ,' in 1810, upon the system of Jussieu, there probably were not more than two or three other botanists in this country who could understand or make use of it; and it was not till after the year 1820 that it became much known among us.

In his 'Genera Plantarum,' Jussieu divided the vegetable kingdom into classes, subclasses, orders, and genera, not according to certain arbitrary distinctions, but by taking into consideration all the circumstances which he was acquainted with in their manner of growth and degree of development. Those which he regarded as the least perfectly organised species he stationed at the one end of his system, and, proceeding upon the principle of continually grouping together those plants which resemble each other more than they resemble anything else, he gradually arrived at the highest forms of vegetable life through a long series of intermediate gradations. In determining the relative dignity of his orders, he assumed that those species are least perfectly organised which have no cotyledon or rudimentary leaf in their embryo; that next in degree, but higher than these, are such as have one cotyledon; and that highest of all are those whose seeds have two cotyledons: hence his classes Acotyledons, Monocotyledons, and Dicotyledons. In arriving at this conclusion he was justified by the fact that to the highest class belong the lofty trees of the forest, with all their intricate apparatus of trunks, and arms, and branches; to the middle the simple-stemmed palms, lilies, and grasses; and to the lowest such forms of vegetation as *Fungi*, lichens, and sea-weeds.

In determining the subordination of the genera assembled under each of these classes Jussieu was influenced by other considerations. He regarded those dicotyledonous genera which have no corolla as lower than such as possess that organ, and among those which have it the adhesion of the parts of the corolla into a tube was looked upon as an indication of a structure inferior to the total separation of the petals: this gave him for his great dicotyledonous class the subclasses *Apetalæ*, *Monopetalæ*, and *Polypetalæ*. In addition to which he formed another subclass, called *Diclines irregulares*, out of such dicotyledonous plants as have the sexes separated, which he considered an irregularity of organisation. As a last method of division Jussieu applied to Monocotyledons and all the subclasses of Dicotyledons a principle of analysis dependent upon the situation of the stamens, calling them 'hypogynous' if the stamens originate clear of both calyx and ovary; 'perigynous' if they grow from the calyx or corolla; and 'epigynous' if their apparent origin is in the apex of the ovary. There seems to have been no other reason for this than that such a "triplex staminis situs" was found to exist. The result of all these distinctions was the following scheme, under which were arranged all the natural orders known to the author:—

		Index Methodi		
		Ordines Naturales complectentis.		
Acotyledones				Class 1
Monocotyledones	Stamina hypogyna			2
	" perigyna			3
	" epigyna			4
Apetalæ	Stamina epigyna			5
	" perigyna			6
	" hypogyna			7
Dicotyledones.	Corolla hypogyna			8
	" perigyna			9
	Monopetalæ	" epigyna	{ Antheris connatis	10
			{ Antheris distinctis	11
Polypetalæ	Stamina epigyna			12
	" hypogyna			13
	" perigyna			14
Diclines irregulares				15

In the state of science when this system was promulgated its excellence was most remarkable. Its faults are the artificial nature of all the divisions except those which are primary, the difficulty in many cases of determining to which of them a given plant belongs, and the numerous exceptions to which they are all subject, which may be owing to their being mere structural and not physiological distinctions. They have accordingly been much criticised, especially of late years, and every original writer attempts to improve them, with various success. But, to use the words of his son, to whose sentiments it is impossible for any botanist to refuse his assent, "What is it that is most admired in this work? not so much the systematical key, which has been so often attacked and abandoned by modern writers, as the admirable sagacity which regulated all the details. It is the neatness of the characters, the happy employment of such as had been previously neglected, and the correct estimate of their value, the prodigality with which notes full of deep knowledge and fruitful in new ideas are dispersed throughout the work, the endless questions and doubts, which show how much the author had meditated upon his subject, and that he was among the first to regret the sacrifices he was compelled to make to the necessity of a systematical arrangement; and finally, that instinct, so true to natural affinities, which so often made him suspect the truth when he could not establish it."

No doubt Jussieu was largely indebted to our countryman Ray, BIOC. DIV. VOL. III.

whose name however does not appear among his introductory remarks; no doubt he was also assisted most essentially by Tournefort, Linnæus, and other systematical writers; but we are not on that account to withhold from him one particle of that merit which his countrymen eagerly claim for him. Ray could not apply his own principles; Tournefort and Linnæus were mere system-makers, who did not understand the principles of philosophical classification; but Jussieu had the philosophy of the one, the systematical abilities of the others, and the peculiar skill of combining them into a consistent whole. His 'Genera Plantarum' is now obsolete: for what has since been done towards giving a more philosophic character to the study of systematic botany we refer to the article BOTANY, in the NATURAL HISTORY DIVISION of the ENGLISH CYCLOPEDIA.

In 1779, when the 'Genera Plantarum' was published, the political state of France, which put an end to peaceful occupations, and turned the public from all thoughts of botany, disturbed the tranquil tenor of the course of Jussieu, and compelled him to mingle in the busy scenes of public life. In 1790 he was named member of the municipality of Paris, and in this character was charged with the direction of the hospitals and charities of that city, which he continued to exercise till 1792. In 1798 the Jardin du Roi was re-organised under the new name of Jardin des Plantes; all the persons charged with the duty of public instruction were elevated to the rank of professors, and De Jussieu, who had been previously Botanical Demonstrator, became Professor of Rural Botany. He afterwards became director and treasurer of the Museum of Natural History, and recommenced, in 1802, his botanical writings, chiefly in the form of memoirs upon his own natural orders of plants. These, amounting in number to fifteen, were continued in the 'Annales du Museum' till 1820, after which time De Jussieu became dead to science. He was then seventy-two, with a sight so feeble that it might almost have been called blindness, and he was no longer able to do more than profit by the observations of others. Nevertheless, he employed himself between his eighty-third and eighty-eighth year in dictating a new edition of his 'Introductio in Historiam Plantarum.' This work was published after his death; it is written in elegant Latin, and is a remarkable proof of the vigour of his intellect even at this advanced age. He appears to have been much loved by his family and greatly respected by his friends. His amenity of character was such that he was never in any one of his writings betrayed into a single word of harshness towards his contemporaries. He died, after a short illness, on the 15th of September 1836.

ADRIEN DE JUSSIEU, his son, born at Paris on the 23rd of December 1797, was educated for the medical profession, but devoted himself to the study which had rendered his father famous, and became his successor in his chair of botany, and the inheritor of his virtue and talents. Adrien de Jussieu wrote no great work, but his communications to scientific journals, monographs, scientific biographies, &c., were very numerous. Among the more important of his writings may be named his 'De Uphorbiacearum generibus,' &c., 1824; 'Sur les Plantes du Chili,' the 'Flora Basilicæ Meridionalis,' written in conjunction with M. Auguste de Saint-Hilaire; his contribution to the 'Cours Élémentaire d'Histoire Naturelle' of M. Milne-Edwards, &c. M. Adrien de Jussieu was chosen in 1831 a member of the Académie des Sciences, of which he was president the year of his death. He died on the 29th of June 1858.

JUSTINIANUS, FLAVIUS, born near Sardica in Mœsia in 482 or 483 of obscure parents, was nephew by his mother's side to Justinus, afterwards emperor. The elevation of his uncle to the imperial throne in 518 decided the fortune of Justinian, who, having been educated at Constantinople, had given proofs of considerable capacity and application. Justinus was ignorant and old, and the advice and exertions of his nephew were of great service to him during the nine years of his reign. He adopted Justinian as his colleague, and lastly, a few months before his death, feeling that his end was approaching, he crowned him in presence of the patriarch and senators, and made over the imperial authority to him, in April 527. Justinian was then in his forty-fifth year, and he reigned above thirty-eight years, till November 565, when he died. His long reign forms a remarkable epoch in the history of the world. Although himself unwarlike, yet by means of his able generals, Belisarius and Narses, he completely defeated the Vandals and the Goths, and re-united Italy and Africa to the empire. Justinian was the last emperor of Constantinople who, by his dominion over the whole of Italy, re-united in some measure the two principal portions of the ancient empire of the Cæsars. On the side of the east the arms of Justinian repelled the inroads of Khosroes, and conquered Colchis; and the Negus or King of Abyssinia entered into an alliance with him. On the Danubian frontier the Gepidæ, Longobards, Bulgarians, and other hordes, were either kept in check or repulsed. [BELISARIUS.] The wars of Justinian's reign are related by Procopius and Agathias.

Justinian must be viewed also as an administrator and legislator of his vast empire. In the first capacity he did some good and much harm. He was both profuse and penurious; personally inclined to justice, he often overlooked through weakness the injustice of subalterns; he established monopolies of certain branches of industry and commerce, and increased the taxes. But he introduced the rearing of silkworms into Europe; and the numerous edifices he raised, the

towns he repaired or fortified, attest his love for the arts, and his anxiety for the security and welfare of his dominions. Procopius, 'De Edificiis Domini Justiniani,' gives a notice of the towns, temples (St. Sophia among the rest), convents, bridges, roads, walls, and fortifications constructed or repaired under his reign. The same Procopius however wrote a secret history ('Anecdota') of the court and reign of Justinian and his wife Theodora, both of whom he paints in the darkest colours. Theodora indeed was an unprincipled woman, with some abilities, who exercised till her death in 548 a great influence over the mind of Justinian, and many acts of oppression and cruelty were committed by her order; but yet the 'Anecdota' of Procopius cannot be implicitly trusted, as many of his charges are evidently misrepresentations or malignant exaggerations.

Coin of Justinian.
British Museum. Actual size.

Justinian was easy of access, patient of hearing, courteous and affable in discourse, and perfect master of his temper. In the conspiracies against his authority and person he often showed both justice and clemency. He excelled in the private virtues of chastity and temperance; his meals were short and frugal: on solemn fasts he contented himself with water and vegetables, and he frequently passed two days and as many nights without tasting any food. He allowed himself little time for sleep, and was always up before the morning light. His restless application to business and to study, as well as the extent of his learning, have been attested even by his enemies ('Anecdota,' c. 8, 13). He was or professed to be a poet and philosopher, a lawyer and theologian, a musician and architect; but the brightest ornament of his reign is the compilation of Roman law, which has immortalised his name. The first compilation of the most useful laws, or 'constitutions,' which had been promulgated by the predecessors of Justinian from Hadrian to his own time, was published in April 529. A revised code, divided into twelve books, was issued in December 534, under the title of the 'Codex Justinianus repetitæ prælectionis,' and thenceforth had the force of law. In the year following the publication of the first edition of his Code, Justinian undertook the much greater and more important work of extracting the spirit of jurisprudence from the decisions and conjectures, the questions and disputations, of the Roman civilians. Their lucubrations had in the course of centuries filled a vast number of volumes, but Trebonius and his sixteen associates, to whom Justinian entrusted the commission, completed their task in three years. The work was styled 'Digesta,' and also 'Pandectæ' ('embracing all'), and was published in December 529. It was declared by the emperor that it should have the force of law all over the empire, and should supersede all the text-books of the old jurists, which in future were to be of no authority. The 'Digesta' is divided into fifty books, each book being also divided into titles, and subdivided into sections. While the 'Digest' was being compiled, Justinian commissioned Trebonius and two other civilians to make an abridgement of the first principles of the law, for the use of young students. This new work being completed, was published under the name of 'Institutiones' about a month before the appearance of the 'Digest.' Besides these three compilations, the 'Code,' the 'Institutes,' and the 'Digest,' Justinian, after the publication of the second edition of his 'Code,' continued to issue new laws, or constitutions, chiefly in Greek, upon particular occasions, which were collected and published together after his death under the name of *Novæ*, or *Constitutiones Novellæ*, or *Authenticæ*. The *Novellæ* are divided into 9 *Collationes* and 168 *Constitutiones*, or, as they are now often called, *Novels*. The *Novellæ*, together with thirteen edicts of Justinian, make up the fourth part of his legislation.

Unfortunately Justinian's love of theological controversy led him to interfere with the consciences of his subjects, and his penal enactments against Jews and heretics display a spirit of mischievous intolerance which has ever since afforded a dangerous authority for religious persecution. Justinian died, at eighty-three years of age, on the 14th of November 565, leaving no children, and was succeeded by his nephew, Justinus II.

JUSTINIANUS II., son of Constantine III., a lineal descendant of the Emperor Heraclius, succeeded his father on the throne of Constantinople in 685. His reign, which lasted ten years, was marked chiefly by wars with the Saracens, and by the exactions and oppressions of his ministers. At last his general Leontius drove him from the throne, had his nose cut off, and banished him to the Crimea in 695. Leontius however was soon after deposed himself and banished by Tiberius Apsimerus, who reigned for seven years. Meantime Justinian had escaped from the Crimea, and married the daughter of the Kakan, or king of the Gazari, a tribe of Turks; and he afterwards, with the assistance of the Bulgarians, entered Constantinople, and put to a cruel death both Leontius and Tiberius, with many others. He ordered also many of the principal people of Ravenna to

be put to death. At last Justinian was dethroned and killed by Philippicus Bardanes in 711.

JUSTINUS, the historian, is supposed to have lived under Antoninus Pius, as it would appear from the preface to his History, which he addresses to that emperor. The passage in which the emperor's name occurs is found in the older editions, but its authenticity is disputed. Nothing else is known of his personal history. He compiled an abridgement or epitome of the Universal History of Trogius Pompeius, who lived in the time of Augustus, and which consisted of forty-four volumes, as Justin tells us in his preface. The work of Trogius is unfortunately lost, except the prologi or heads of contents of each book, from which it appears that Justinus has been at times a careless abbreviator, having entirely omitted several interesting subjects which were treated by Trogius, such as in book i., the account of the Eolian and Ionian cities in Asia, of the origin of the Tusci or Etrusci in Italy, and of the cities of Egypt. Another charge against Justinus is the confused order in which he has narrated events, but this fault may be ascribed to the text of Trogius. Book i. treats of the Assyrians from Ninus to Sardanapalus, and of the Medians, Lydians, and Persians to Darius Hystaspes. The next five books are occupied by the history of the Greek and Persian wars; but by far the largest part of the work, from book vii. to book xvii. inclusive, is engrossed by the history of the Macedonian kingdom and empire, before and after Alexander. Books xviii. to xxiii. treat of Carthage and Sicily; books xxiv. to xl. treat of Greece, Macedonia, Asia, and Egypt, under the successors of Alexander down to the Roman conquest; books xli. and xlii. treat of the Parthians; book xliii. treats of the origin of Rome and of Massilia (Marseille); and the last book is upon the history of Spain. Book xxxvi., in which the author speaks of the Jews, has been commented upon by J. J. Schudt, in his 'Historia Judaica ex Gentilium Scriptis Collecta,' 8vo, Frankfurt, 1700. Among the best of the numerous editions of Justinus may be mentioned that by Abr. Gronovius, with variorum notes and dissertations, 1719, reprinted in 1760; that of J. G. Grævius, Leyden, 1683; that of the Bipontine Society, 1802; that of Wetzel, 1806; and that of Frotzcher, 1827.

JUSTINUS, commonly called JUSTIN, MARTYR, one of the early fathers of the Christian church, was born near the end of the 1st, or early in the 2nd century, in Palestine, at a place then called Neapolis, a new city, as may be inferred from its name, which had arisen upon the site of or near the ancient town of Sichem, of which we read in the Old Testament. His father was a Greek. Justin was carefully instructed in the learning of the Grecian schools of philosophy, in the course of his studies visiting Alexandria, then a celebrated seat of learning; and travelling much in Egypt. With a mind deeply imbued with the Platonic philosophy, he became sensible to the truth and beauty of Christianity, and made a public profession that he received it as divine truth. This was about the year 132.

During the remainder of his life Justin continued in the profession of Christianity, and is distinguished among the fathers of the church by the apologies and defences which he published. His first apology for Christianity was addressed to the emperor Antoninus, at a time when the Christians were suffering rather from popular fury than from the bearing upon them of the regular authority of the state, and it prevailed so far as to obtain for them some favourable concessions from the emperor. His second apology was addressed to the successor of Antoninus, Marcus Aurelius, on occasion of several Christians having been put to death for their faith. Both these apologies are extant; as well as another work of Justin's, which is a dialogue with Trypho, a learned Jew, in defence of Christianity. Of the genuineness of these works there is little doubt. There is also another work of his 'On the Unity and Sovereignty of God;' but great suspicions are entertained of the genuineness of some other writings which have been attributed to him.

We have now to relate his end. The usual place of his residence was Rome, where, in or about 165, he was put to death a martyr to Christian truth: he is said to have been first scourged and then beheaded. It was eminently as a martyr or witness that he suffered; for he might have saved his life had he consented to join in a sacrifice to the heathen deities. Hence with his name has descended the addition of The Martyr, a distinction which in a later age was given to Peter, one of the Protestant sufferers for the truth.

'The Dialogue with Trypho' was edited by Dr. Samuel Jebb, and the 'Apologies' by Dr. Charles Ashton, two learned Englishmen of the last century. Among the best editions of the whole works of Justin may be named the editio princeps of the collected works of Stephens, folio, 1551; that of Oberthür, 2 vols. 8vo, 1777; and especially that of Otto, 2 vols. 8vo, Jena, 1842-44. There are English translations of the Apologies by William Reeve, M.A., 2 vols. 8vo, 1809; and of the Dialogue by Henry Brown, M.A., 1755.

JUSTINUS I., by birth a peasant of Dacia, in his youth enlisted in the guards of the emperor Leo I. Under that and the two following reigns Justin distinguished himself by his military services, and gradually attained the rank of tribune, count, general, and lastly the command of the guards, which he held when the emperor Anastasius died, A.D. 518. He was then proclaimed emperor by the soldiers, being sixty-eight years of age, and the clergy and people approved the choice. Justinus, being himself uninformed in civil affairs, relied for the

despatch of the official business of state on the quaestor Proclus, a faithful servant, who was also the friend of Justinian, Justin's nephew, who himself had acquired a great ascendancy over his uncle. By Justinian's advice a reconciliation was effected between the Greek and the Roman churches in 520. The murder of Vitalianus, who had been raised to the consulship, but who, having excited the suspicion and jealousy of the court, was stabbed at a banquet, casts a dark shade upon the character of both Justin and Justinian. In other respects Justin is represented by the historians as honest and equitable, though rude and distrustful. After a reign of nine years, being afflicted by an incurable wound, and having become weak in body and mind, Justin abdicated in favour of his nephew, and died soon after, in 527.

Coin of Justinus I. or II.
British Museum. Actual size.

JUSTINUS II, nephew of Justinian I., by his mother Vigilantia, was raised to the throne by the senators and the guards immediately after the death of his uncle, on the 15th of November 565. Soon after complaints reached Constantinople from the Romans against Narses the conqueror of the Goths, and exarch of Ravenna, whose great qualities were stained with avarice, and whose government had become unpopular in Italy. A new exarch, Longinus, was appointed to supersede Narses, and the empress Sophia, Justin's consort, added to the letters of recall the insulting message, that the eunuch Narses should leave to men the exercise of arms and the dignities of the state, and return to his proper place among the maidens of the palace, where a distaff should be placed in his hand. To this insult Narses is said to have replied, "I will spin her such a thread as she will not easily unravel;" and he is said to have invited the Longobards, and their king Alboin, to invade Italy. However this may be, Alboin invaded Italy by the Julian Alps in 568, and in a few years all North Italy was lost to the Byzantine emperor. The provinces of Asia were likewise overrun by the Persians. Internal discontent prevailed in the capital and provinces, owing to the malversations of the governors and magistrates, and Justin himself, deprived by infirmity of the use of his feet, and confined to the palace, was not able to repress abuses and infuse vigour into the administration. Feeling at last his impotence, he resolved on abdicating the crown, and as he had no son, he chose Tiberius, the captain of his guards, as his successor. The conduct of Tiberius fully justified Justin's discernment. Justin lived four years after his abdication in quiet retirement, and died in the year 578.

JUVENAL. Of the personal history of this great poet scarcely anything appears to be certainly known. His name is variously written, Decius, or Decimus, Junius Juvenalis. His birthplace, on no very sure ground, is said to have been Aquinum, a Volscian town; and he

is said to have been born somewhere about A.D. 40, under Caligula, and to have died, turned of eighty, under Hadrian. He was of obscure extraction, being the grandson of an enfranchised slave. Some of his biographers say that he followed the profession of a pleader. He was intimate with the poet Martial. (Martial, 'Ep,' vii. 24, 91; xii. 18.) It does not appear that he gained any reputation until the publication of his Satires, which was late in life, after he was turned sixty. Still later he was sent in command of a cohort of infantry to Egypt, where he died from vexation and weariness of this honourable exile, which it is said was inflicted upon him as a punishment for satirising a favourite of Hadrian under the person of Paris, the favourite actor of Domitian: see 'Sat,' vii. 88, where Paris is described as the bestower of military patronage.

The relative merits of Juvenal and Horace as satirists have been warmly contested. It is a question on which men will form opposite opinions, as their tempers are more fit to relish brilliancy and playfulness, or earnest and dignified declamation. Juvenal is said to have spent much time in attendance in the schools of the rhetoricians, and the effect of this, in an age not remarkable for purity of taste, may be observed perhaps in a tendency to hyperbolic inflation, both of thought and style, which would soon betray a writer of less power into the ridiculous. From this his wit, command of language, and force and fulness of thought, completely preserve him: still perhaps he would produce more effect if the effort to do his utmost were less apparent. Dryden says, "Juvenal gives me as much pleasure as I can bear. He fully satisfies expectation; he treats his subject home. His spleen is raised, and he raises mine: I have the pleasure of concernment in all he says. He drives his reader along with him, and when he is at the end of his way I willingly stop with him. If he went another stage it would be too far, and turn delight into fatigue. When he gives over 'tis a sign the subject is exhausted, and the wit of man can carry it no farther. If a fault can justly be found in him, 'tis that he is sometimes too luxuriant, too redundant." His writings are addressed to the encouragement of virtue no less than to the chastisement of vice; and parts of them have been recommended by Christian divines as admirable storehouses of moral precepts. Still they lie open to the objection of descending so minutely into the details of vice as to minister food as well as physic to the depraved mind. To the scholar they are invaluable for the information which they supply concerning private life among the Romans. The editions of Juvenal are very numerous; that of Ruperti has (in England at least) nearly superseded others: it is attended by a copious body of explanatory notes, which are much needed in reading this difficult author. Later and very valuable editions are those of Weber, Weimar, 1825; and Heinrich, Bonn, 1830. Juvenal has been translated into English by Holiday, Dryden (who however only translated five satires of the edition which bears his name), Gifford, and Hodgson. The French prose translation of Dussault is highly praised. [DRYDEN; GIFFORD.]

JUVENTIUS CELSUS. [CELSUS.]

K

KAEMPFER, ENGELBERT, well known as a botanist, and still more as a traveller, was born on the 16th of September 1651 at Lemgo, in the principality of Lippe-Detmold, in Germany, where his father was rector of the church of St. Nicholas. He was sent successively to the schools of Hameln, Lüneburg, Hamburg, and Lübeck, in all which he was distinguished by his rapid progress in the ancient languages, history, geography, and music. He was afterwards sent to the gymnasium of Danzig, and he then studied at the University of Cracow in Poland for three years, and at Königsberg in Prussia for four years more. At the last-mentioned place he applied himself closely to the study of physic and natural history. From Prussia he went to Sweden, where the extent of his knowledge and his talents procured him very advantageous offers on condition of settling at Upsala; but his desire to see remote countries led him to decline the proposals, and he solicited and obtained the place of secretary to an embassy which was then going to Persia. The embassy passed through Moscow, Kasan, and Astrakhan, where they embarked for Persia, and landed at Nizabad, in Daghestan, on the western shores of the Caspian Sea. While they were waiting for their passports in the town of Shamaki, in Shirvan, Kaempfer made an excursion to the peninsula of Absheran: he was the first naturalist who visited this remarkable spot, its wells of Naphtha and its ever-burning fire, which he described in his 'Amoenitates Exoticae.' In 1684 the embassy arrived at Ispahan, then the capital of Persia. The information which Kaempfer collected during a residence of two years at that place, respecting Persia and its natural productions, is embodied in his 'Amoenitates.' When the embassy returned to Europe in 1685, Kaempfer entered as surgeon into the service of the Dutch East India Company, and served in that capacity in the navy then cruising in the Persian Gulf. After a long illness at Bender Abassi, he sailed for Batavia in 1689, and in this passage visited most of the countries on the western shores of Hin-

dustan. At Batavia he occupied himself chiefly with the natural history of the island of Java. In 1690 he set out from Batavia on his voyage to Japan, as physician to the embassy which the Dutch East India Company annually sent to the Japanese court. He embarked in the vessel which was to touch at the kingdom of Siam, and visited Judia, or Juthia, then the capital of that country. He remained at Nagaaki, in Japan, from September 1690 to November 1692, and during this time he accompanied two embassies to Yeddo. His observations on Siam and Japan are given in his great work entitled 'The History of Japan,' the original of which has never been published, but a translation was made from a copy in the possession of Sir Hans Sloane by J. G. Scheuchzer, and published in England in 2 vols. folio, 1727. Kaempfer returned from Japan to Batavia, which he left in 1698 for Amsterdam. In April 1694 he took the degree of Doctor of Physic at the University of Leyden, and in the theses which he published on that occasion he showed that the Angus Scythica, or Barometz, a pretended plant-animal, was nothing but a fiction; he also described other remarkable objects, and among them the electrical eel. On his return to his native place his reputation soon procured him the honour of being appointed physician to his sovereign, a circumstance which brought him into extensive practice. This however was a loss to science. Of the various works which he designed to publish only his 'Amoenitates Exoticae' appeared during his lifetime (in 1712). His 'History of Japan,' as already observed, appeared much later, and only in English, from which it was afterwards translated into German and French. He died on the 2nd of November 1716, his health having been much impaired by his travels and some domestic calamities.

KAIN, LE, HENRI-LOUIS, a French actor, so often spoken of in the memoirs of French literature in the middle of the 18th century, that some account of him may be useful. He was born in 1723, and died in 1778. He was a protégé of Voltaire, who observed the natural

strength of his histrionic genius, and removed him from an humble operative profession. He acquired his chief celebrity in the characters of Voltaire's plays; yet, owing to a singular series of events, that author never saw him on the stage. He was unable to make his debut until seventeen months after Voltaire's departure for Prussia in 1750, and on the author's return, after an absence from Paris of twenty-eight years, he found the actor about to be buried. Louis XV. stamped the reputation of Le Kain by saying, "Il m'a fait pleurer; moi qui ne pleure guère." Like the English actor to whose name that of Le Kain bears a great resemblance, he was small in person, and his success arose from his power of representing deep passion and vehement emotion. The character of his acting was novel, and while it fascinated the audience, it did not at first satisfy the critics, who termed him 'le Convulsionnaire.' He was critical and accurate in costume, and attended minutely to its topical and chronological applicability.

* KANE, SIR ROBERT, M.D. Robert John Kane was born in 1810 in the city of Dublin, where his father was a manufacturing chemist. He was educated for the medical profession, and was attached at an early age to the Meath Hospital, of which he was appointed the chemical clerk. He was afterwards Professor of Chemistry to Apothecaries' Hall, Dublin; and was elected a member of the Medico-Chirurgical Society of Dublin, and a corresponding member of the societies of Pharmacy and of Medical Chemistry of Paris. In 1830 he obtained the prize offered by Dr. Graves for the best essay on the Pathological Condition of the Fluids in Typhus Fever. In 1831 he published 'Elements of Practical Pharmacy,' 12mo, Dublin, a work intended to convey to the medical student a knowledge of the principles upon which the more important pharmaceutical operations are founded, and thus to fill up the space which existed between the detail of the processes in pharmacopias and the theoretical explanations of their nature in systematic works. Having entered himself of Trinity College, Dublin, he obtained from it in 1832 his degree of M.D., and in the same year projected the 'Dublin Journal of Medical Science.' In 1838 Dr. Kane married Miss Baily, niece of Mr. Francis Baily, the astronomer, and authoress of 'The Irish Flora.' In 1841 he was elected a Fellow of the Irish College of Physicians, and in the same year published the first part of his 'Elements of Chemistry.' The third part, completing the work, was published in 1842. In 1844 Dr. Kane published a work on 'The Industrial Resources of Ireland,' 8vo, Dublin. This work comprises a course of public lectures delivered before the Royal Dublin Society at the commencement of 1844, and published at the request of that society. He was Professor of Natural Philosophy to the Royal Dublin Society, a situation which he resigned in 1847, in which year the Royal Irish Academy (of which he had been elected a member in 1832 and one of the council in 1841) awarded him the Cunningham gold medal for some useful discoveries in chemistry. In 1845 he had been employed by government, in conjunction with Professors Lindley and Taylor, in investigating the cause of and the means of preventing the potato disease then ravaging Ireland. Their labours however were unsuccessful.

Dr. Kane in 1846 received the honour of knighthood from the lord-lieutenant, and in the same year his recommendations were carried out by the formation of the Museum of Irish Industry, a collection of implements and materials for agricultural, mining, and manufacturing operations. In 1848 Sir Robert Kane published a pamphlet entitled 'The Large and Small Farm Question considered in regard to the Present Circumstances of Ireland,' 8vo, Dublin, in which he recommends the formation of small farms. In 1849 he published a second edition of his 'Elements of Chemistry, Theoretical and Practical, including the most recent Discoveries and Applications of the Science to Medicine and Pharmacy, to Agriculture and to Manufactures, illustrated by 230 Wood-Cuts,' 8vo, Dublin. In this edition the whole work has been carefully revised and corrected, many portions have been re-written, and numerous additions have been made. It now forms a very thick volume, and is probably the most extensively useful work of its kind hitherto published. In 1849 the three Queen's Colleges of Cork, Belfast, and Galway were opened for students, and in 1850 the Queen's University in Ireland was instituted, of which the three colleges then became incorporated members. These colleges are formed upon liberal principles for Roman Catholics and Dissenters as well as for members of the Church of England. Sir Robert Kane, who is a Roman Catholic, received the appointment of President of Queen's College, Cork. This college was opened on the 7th of November 1849, when Sir Robert Kane delivered the 'Inaugural Address,' 8vo, Dublin; and on the 25th of October 1850 he delivered an 'Address at the Public Distribution of Prizes,' 8vo, Dublin.

KANT, IMMANUEL, the author of the 'Critical Philosophy,' and distinguished as well for the profundity of his views as for the extent and variety of his researches, was born on the 22nd of April 1724 at Königsberg in Prussia, where he died on the 12th of February 1804. His native city, to which he was so attached that in a long life of nearly eighty years he never left it long or for a great distance, was the scene of Kant's literary activity. Educated at its gymnasium, he removed in 1748 to its university to attend the classes of philosophy, mathematics, and theology. Upon the completion of his academical studies, Kant passed many years in the capacity of tutor, according to his own confession with little satisfaction to himself, since the desire of acquiring knowledge interfered with the duty of imparting it. In

1755 he passed to the degree of M.A., when he commenced a series of private lectures on logic and metaphysics, physics and mathematics, which he continued to give for fifteen years, until he was invited in 1770 to fill the chair of the former science, which he held until 1794, when his declining strength compelled him to resign its arduous and laborious duties.

The skill and success with which Kant attacked, with his able and searching criticism, the specious but false pretensions of the existing philosophy, gained him the name of the "smasher," or the "destroyer" (der zermalmande), from those who pretended that he was more skilful in destroying than in reconstructing a system. At the time when Kant first entered directly into the arena of philosophy, its possession was disputed by a superficial eclecticism and uncompromising dogmatism on the one hand, and on the other by a bold unlimited doubt which was cherished by the refined and consequential scepticism of Hume's writings. To put an end to this state of things, which was as dangerous to the truths of morality and religion as it was subversive of the legitimacy of knowledge, was the object of Kant's philosophical labours; and for this purpose he sought to expel both dogmatism and scepticism from the domain of philosophy.

Kant accordingly proceeded to an examination of man's cognitive faculty, in order to discover the laws and extent of its operation. This investigation he designated the criticism of the pure reason, and held that the reason, as a pure faculty, must criticize not only itself, but also, as the highest activity of the human intellect, the subordinate faculties of sense and understanding. Kant understood by pure whatever is independent of experience, as opposed to the empirical, which rests upon it. The pure, or whatever in knowledge expresses the universal and necessary is *a priori*, that is, antecedent to experience; whereas all that is contingent or only comparatively general is *a posteriori*. The first requisite in philosophy is a science which may establish a possibility, and determine the principles and extent of such knowledge. Now it cannot be derived from experience, which only shows an object to us such as it appears to be, without declaring that it must be such as it is. All attempts to derive the necessary from experience are unsuccessful, simply because they contradict the consciousness which recognises an essential difference between necessary and contingent. Experience serves only as a stimulus to awaken the faculties of pure cognition, so that afterwards, by reflection and abstraction (absonderung), we become specially conscious of them. As then we are undoubtedly in possession of such pure or *a priori* knowledge, of which it is impossible to place the origin in experience, it must have its root in the pure reason itself, which, on the other hand, cannot be the ground of the contingent and empirical; for the pure reason contains nothing but the formal or necessary principles of all knowledge, whereas the objects to which these principles refer are given to the mind from without. As an instance of these universal and necessary principles, Kant adduces the law of causation, the speculations of Hume upon which afforded the occasion of his philosophical investigations. He observes that the notion of a cause so manifestly implies the necessity of its being connected with some effect, and enforces so strongly the universality of this law, that it is totally inconsistent with the derivation of it from the repeated association of an effect with an antecedent. The next point which Kant notices in the 'Introduction to Critic of the Pure Reason,' as of great importance for the right appreciation of his philosophical system, is the distinction between analytical and synthetical judgments. The former are those in which the predicate is connected with the subject by identity; the latter are devoid of all identity of the subject and predicate. Analytical judgments may be also termed explanatory, the synthetical extending (erweiterungsurtheile) judgments; since in the former the predicate adds nothing to the notion of the subject, and only resolves the notion which forms the subject into its constituent and subordinate notions, which however involved are really contained in it, whereas in the latter a new element is added by the predicate to those already contained in the subject, which was not previously understood in it, and therefore would not result from it by any analysis. For instance, the proposition that all bodies are extended is analytical; but the assertion that all bodies are heavy is synthetical. All the conclusions of experience are synthetical. Experience proves the possibility of the synthesis of the predicate "heavy," with the subject "body;" for these two notions, although neither is contained in the other, are nevertheless parts of a whole, or of experience, which is itself a synthetical combination of its intuitions (anschauungen), although they only belong to each other contingently.

This contingent bond of union however is wholly wanting in synthetical judgments *a priori*. For instance, in the position, "whatever happens has a cause," the notion of a cause is not contained in the subject "whatever happens," and it indicates something very different from it. How then, and by what means, are we enabled to say of "whatever happens" something absolutely different from it, and to recognise "cause," although not contained in it, as necessarily belonging to it? What is that unknown principle ($=X$) on which the understanding relies, when of the subject A it finds a foreign predicate B, and believes itself justified in asserting their necessary connection? It cannot be experience, since in the above proposition the conception of a cause is attached to the subject, not merely generally, but uni-

versally and necessarily. Now all speculative *à priori* knowledge ultimately rests upon such synthetic or extending judgments; for though the analytical are highly important and requisite for science, still their importance is mainly derived from their being indispensable to a wide and legitimate synthesis, whereby alone a new acquisition in science can be made. The proper problem therefore of the pure reason is contained in the question—how are synthetic judgments *à priori* possible?

With a view to resolve this problem of the pure reason Kant begins with an exposition of the transcendental elements of knowledge (transcendental elementarlehre). By transcendental he understood original or primary, or whatever is determined *à priori* in reference not only to human cognition but also to man's collective activity, and which consequently is the basis of the empirical, or that which is determined *à posteriori*. In short, all pure knowledge makes up the transcendental philosophy, and on it rest the authority and possibility of cognition. The elementarlehre is divided into the transcendental aesthetic and the transcendental logic. In the former Kant investigates the *à priori* elements of the lowest cognitive faculty—sensation; in the latter, those of the understanding and of the reason. In the aesthetic he shows that the sensuous faculty receives the matter of its intuitions and sensations from without by means of certain affections or excitements of the sense, whereas the forms according to or by means of which this matter is shaped into representations or conceptions of determinate objects are given originally and by itself. These forms are the pure intuitions of space and time, because in them nothing else is intuitively viewed than the unity of that which is multiple either in succession or in co-existence. On this account he calls time and space forms of intuition, and designates the objects which we so intuitively view by the name of phenomena. Of the ground of these phenomena, or, as Kant termed it, the thing in and by itself, it is left doubtful and undetermined whether it is anything actual or not, notwithstanding that Kant ascribes to phenomena themselves a certain objectivity or reality, on the ground that from their constancy and regularity they cannot be a mere semblance or illusion of the senses. On this account his theory has been called a transcendental idealism, as being in nowise inconsistent with that system of empirical realism which by our conduct in life we practically maintain.

Transcendental logic is divided into analytic and dialectic, of which the former is the critic, or investigation of the understanding, as the faculty of notions; the latter, of the reason, as the faculty of ideas. In the analytic we are taught that it is only when objects have been conceived by the understanding agreeably to its laws, that they can become an object of knowledge. The operations of the understanding are confined to analysis and synthesis, where however every analysis presupposes a synthesis. A combination of the multiple into unity constitutes a notion (*begriff*), and the understanding is therefore the faculty of notions. The law of the forms of these notions, irrespective of their contents, is investigated by logic in general, whereas the investigation of these notions in reference to their contents is the proper office of transcendental logic. Notions are either pure or empirical: the former indicating merely the nature and the manner of their combination: the latter, the multiple matter presented by experience. Both are equally necessary to knowledge, for the pure notion is an empty thing apart from the representations, and the latter without the former are blind ('*Kritik d. rein. Vern.* p. 55). As sensation only receives matter upon the affection of the senses, it is a mere receptivity, whereas the understanding, which subsumes the given multiple into unity, is a spontaneity. The consciousness of the individual in this multiplicity is effected by the imagination, which combines them into a whole; whereas the unity, by which the multiplicity, as sensuously perceived, is recognised as an object, is a work of the understanding. Now this unity constitutes the form of the notion, which therefore is the peculiar creation of the understanding. As these forms are different, a complete enumeration of them conformable to some stable principle is necessary in order to a discovery of the laws of knowledge by the understanding. Now all the primary modes of the operations of the understanding, whereby objective unity is imparted to the perceived matter, may be reduced to one of these four: quantity, quality, relation, and modality. These with their subordinates, Kant denominates categories after Aristotle, as determining in and by themselves what in general and antecedently (*à priori*) may be predicated of objects.

The three categories of quantity are unity, multitude, and totality; those of quality, reality, negation, and limitation. Those of relation are double and are paired together, as substance and accident, cause and effect, action and re-action. Lastly, the subordinates of modality are possibility, existence, and necessity.

The process by which these twelve categories, or pure notions of the understanding, are combined with space and time, the pure intuitions of sensation, and thereby presented to knowledge in their possible application to the objects of sense, Kant calls schematism (*σχηματισμός*). For instance, the notion of substance is said to be schematised, when it is not conceived of absolutely as a self-subsisting thing, but as one which persists in time, and therefore as a constant and persisting substrate of certain variable qualities or determinations. Notions thus rendered sensible are called schematised, in opposition to the pure categories. In this process the imagination co-operates with the

understanding, and its action is original and necessary, since its activity is inseparably bound up with the primary images of space and time. Out of this schematism of notions and the judgments which arise from their combination, the grand principles which regulate the operations of the understanding result. These judgments are either analytical or synthetical. The grand principle of the former, in which identity affords the connection between the subject and the predicate, is the principle of contradiction. The mere absence however of contradiction is not sufficient to legitimate the object-matter of any proposition, since there may easily be a synthesis of notions which is not grounded in objects, notwithstanding that it is not inconsistent to conceive. In synthetic judgments, on the other hand, we go beyond the notion which forms the subject, and we ascribe to it a predicate, the connection of which with the subject does not appear immediately from the judgment itself. The possibility of this synthesis implies a medium on which it may rest, and this is the unity of the synthesis in truth *à priori*. The following is the ultimate principle of synthetic judgments:—All objects are subject to the necessary conditions of the synthetic unity of the multiple objects of intuition in a possible experience. As this unity is established according to the table of categories, there must be as many pure synthetic principles as categories, and the different characters of their application must depend upon the different characters of the latter. These are either mathematical, and relate to the possibility of intuition, or dynamical, and relate to the existence of phenomena. Accordingly, the principles of the understanding are, relatively to their use, either mathematical or dynamical. The former are unconditionally necessary, since the possibility of intuition depends upon them; the latter only conditionally necessary, for so far as concerns the existence of phenomena, which for a possible experience is contingent, they imply the condition of empirical thought, notwithstanding that in their application to it they invariably maintain their *à priori* necessity.

By these principles of the pure understanding the possibility of mathematics and of a pure science of nature may be fully and satisfactorily explained. The matter of mathematics is the multiple object of space and time, which are given as the forms of *à priori* intuition. This multiple matter is elaborated by the understanding according to the rules of logic, and as the phenomena must be in accordance with the conditions of space and time, or the forms under which they are intuitively viewed, that is, the relations of space and time must be discoverable in phenomena themselves. The possibility of mathematics therefore rests simply on this, that objects cannot be conceived of except in space and time, from which however it follows at the same time that mathematics do not admit of application beyond the sphere of sensible phenomena. The pure science of nature likewise cannot have any other object than the system of *à priori* laws. It is only under the forms of sensation that individual objects can be intuitively viewed, and their mutual connection cannot be thought of otherwise than under the forms of the understanding. If then the system of phenomena are to be an object of knowledge, they must correspond to the pure synthetical principles of the understanding, and it is only by these *à priori* laws that a science of nature is possible. But the principles of this pure science of nature do not admit of being applied beyond the domain of experience.

The important result of the transcendental logic is that the operations of the understanding are only legitimate in reference to experience, and that consequently the use of the understanding is empirical, and not transcendental. It would be the latter if it could apply itself to objects not as phenomena merely, but as things absolutely. But such a use of the understanding is obviously invalid, since the objective matter of a notion, or *begriff*, is given by intuition alone, and it is only by means of the empirical that the pure intuition itself comes to the object of which it is the form. These forms are simply representations of the object according as it conceived under them. To the *subsumption* of an object under a category, a schema, 'time,' is indispensable, and, apart from all sensation, this schema itself does not subsist; and the subsumption, or arrangement of an object under the categories, is impossible. There may undoubtedly be a logical use of the categories beyond the domain of experience, but this, notwithstanding that it has its ground in the nature of human reason, is either altogether idle, or else involved in contradictions (*antinomie*) which the transcendental dialectic investigates.

But besides phenomena there are other objects presented to the understanding, by a non-sensuous intuition of which consequently it can take cognisance. These Kant calls noumena (*νοούμενα*). The distinction between noumena and phenomena does not consist merely in a logical difference of the greater or less distinctness of their cognoscibility, but in a specific difference of the objects themselves. A noumenon is not the thing in and by itself, for the thing in and by itself becomes evanescent for knowledge when conceived of independently of all sensuous forms. Nevertheless, as experience invariably refers back to something independent of and prior to sensation, the noumenon may be considered as an object which is presented to the understanding by an unsensuous intuition. The general possibility of such a species of intuition is undeniable, notwithstanding that its objects are impossible to be known by man, whose knowledge is dependent on sensation. In a positive sense Kant applies the term of noumenon to the notion of God, and generally to all supra-sensible

objects, which may be conceived of, but nevertheless cannot be an object of perception.

The criticism of the transcendental dialectic gives this result—that the ideas of the reason, as pure speculative ideas, are nothing more than simple conceptions, for which no corresponding object can be scientifically shown to exist. Accordingly neither the existence of God, nor the immortality of the soul, nor the freedom of the will, can be demonstratively established. Nevertheless, the reason is not merely a theoretical, but also a practical faculty, that is, it gives the law of human conduct and action. Now these laws present themselves with such an unconditional necessity (the *categorical imperative*) that no rational man endowed with self-esteem can refuse obedience to them; and, on the other hand, without the freedom of the will these laws could not be obeyed; and without God and the soul's immortality there would be no final cause or motive for human conduct, which must be placed in a state of felicity, agreeable to morality, provided by and to be obtained through God, in another and a better life. Consequently every man who is conscious of his moral destination holds these practical ideas to be both true and objectively legitimate, notwithstanding that he is compelled or required to admit them merely by a subjective ground—the testimony of his own consciousness, and of the moral wants resulting from its dictates. This Kant calls the postulate of the practical reason. The acceptance of this postulate as true and legitimate does not constitute a scientific certainty, or knowledge properly, which indeed does not exist for the supra-sensible; it is merely a belief. This faith, or belief, however, is thus distinguished from every other, that it is a moral or practical faith, and consequently possesses for the believer all the certainty requisite for the guidance and conduct of life, and consequently it enjoys a subjective certainty and authority. This faith is the proper foundation of religion, which is nothing else than a conscientious observance of all duties as divine commands, since God, as the moral law-giver, cannot be worthily honoured otherwise than by obedience to the laws of morality.

Lastly, the critic of the faculty of the judgment (*urtheilskraft*) investigates its operations from an æsthetical or teleological point of view. The totality of objects which constitute nature are in harmony with man's faculty of knowledge. Every object may be considered æsthetically or teleologically; it possesses as it were two natures, one æsthetical and one teleological. The former is the point of view under which it appears to man; the latter consists in its formal or material concordance with the general harmony of things. Now the agreement which we perceive to subsist between a particular object and such an end does not belong to it and is not in the object itself. It is, on the contrary, purely subjective; it belongs to the mind that discovers it, and is dependent upon the mental constitution. In the same manner the judgment is of two kinds. It may either refer to man's mode of conceiving and apprehending objects, and to the degree of pleasure with which the perceptions of them are accompanied; or it may consider the harmonious co-ordination of all things and their subordination to a general end, that is, the objective harmony of nature. The beautiful, the agreeable, and the useful are the forms of our æsthetical judgments, and the perceptions of them are accompanied with pleasure. Nevertheless they affect us differently, and the sensation of pleasure which the beautiful occasions is of all the most complete. The beautiful is the most noble and most elevated of all the forms of æsthetical judgments. It exists in us antecedently to and independently of all experience. It is inherent in us, and forms a constituent element of our proper nature. Our judgments of objects are as necessarily respective of the beautiful as the practical reason is of the just and the good.

The knowledge of nature is only possible on these two conditions: that there are certain relations subsisting between the system of nature and the human mind; and that harmony reigns throughout the system of natural objects, and the necessary subordination of each separately to some general end. Considered in this light, organic being is the most excellent production of nature. The examination of any organic body displays an admirable subordination of the parts to the whole, and the whole itself is in exquisite harmony with each of its parts. But at the same time the whole itself is but a mean to other ends, a part in a greater totality. Consequently the most exalted form of the teleological judgment is that which considers the whole system of nature as one vast organic structure. Thus considered, the synthetic activity of the judgment exercises itself in two ways, either æsthetically or teleologically. In the former case it refers all its decisions to the idea of the beautiful; in the latter, it subordinates all things to a final cause.

KANTEMIR, PRINCE ANTIOCHUS DMITRIJIVITCH, descended from a family of Turkish extraction, was born at Constantinople, September 10, 1708. He received his first education at Kharkov, whence he proceeded to the academy at Moscow, where he made such proficiency in his studies that when scarcely ten years old he composed and recited a discourse in Greek on St. Demetrius. In 1722 he accompanied his father, who was hospodar of Moldavia, in the campaign against Persia, after which (1725) he prosecuted his studies in the Academy of Sciences at St. Petersburg, directing his attention to that language whose literature he subsequently enriched. It was not long before his talents recommended him to the notice of

the empress Anne; and in 1731 he was despatched to the British court in quality of resident, but in the following year was promoted to be ambassador extraordinary and plenipotentiary, in which capacity he was sent in 1738 to the court of France. The empress Elizabeth confirmed all the dignities that had been bestowed upon him by her predecessor. He died at Paris, March 1, 1774, of dropsy in the chest, and his body was conveyed to Moscow for interment in the Greek cloister.

Equally amiable and intelligent, his aim as a writer was to inform and correct, as is sufficiently attested by his Satires, which if now somewhat antiquated in regard to versification and style, are justly esteemed for their originality, truth, and force of colouring, and for the philosophical mind which they display. Both Zhukovsky and Batiuskoff have eulogised the merits of Kantemir as a writer and a man; the first in an analytical essay on his Satires, the other in a very interesting sketch entitled 'An Evening with Kantemir.' His other works were chiefly translations, namely, ten of the 'Epistles of Horace,' Fontenelle's 'Plurality of Worlds,' Epictetus, Cornelius Nepos, Montesquieu's 'Persian Letters,' &c., several of which however remain unpublished.

KARAJICH, or KARADJICH, or KARADSCHITSCH, VUK STEPHANOVICH, the collector of the national ballads of Servia, and author of a Servian Dictionary, was born on the 26th of October (old style) 1787, at Trshich, an obscure village in Turkish Servia, near the town of Lounitza, not far from the Austrian and Hungarian frontier. The Servians of Servia and Bosnia have not as yet in general any family names, and most of his countrymen would have contented themselves with the appellation of Vuk Stephanovich, or Wolf, the son of Stephen; but the surname Karajich has been added in this instance apparently from the name of a district with which the family was connected. Vuk received his education at the school for the dissidents from the Greek Church at Karlovitz, within the Austrian frontier; and having afterwards visited Vienna, his attention began to be directed to literary pursuits, the rather that a feeble and crippled frame unfitted him for bodily labour. During the sanguinary and long-continued struggle of the insurgents of his native country against the Turkish authorities, which commenced in 1804, he acted as secretary to different Servian chiefs, some of whom were ignorant of the art of writing; and he was afterwards employed in the same capacity by the senate of Belgrade and by the self-made prince of Servia, Kara-George, or Black George, during the time of his power, which terminated with the abandonment of the Servians by Russia in 1812, and the cruel triumph of the Turks in 1813. Karajich was then compelled to take refuge in Austria, where he fortunately adopted the advice of Kopitar, the Slavonic scholar, who then held a post in the Imperial library, to employ himself in forming a collection of the Servian ballads. The language, which is sometimes called Servian, sometimes Illyrian, Bosnian, Croatian, Rascian, and different other names, is spoken altogether by about five millions of people, who are peculiarly rich in national song. Translations of a few of their ballads had been printed by Fortis, the Dalmatian traveller, and others, and had attracted the attention of some of the leading German writers, in particular Herder and Goethe, who had spoken loudly in their praise. No one however suspected that a treasure of this kind was in existence, of the extent and value of that which was developed by the unwearied researches of Karajich. Since the publication of his 'Narodne Srpske Pjesme,' or 'Servian National Songs,' it has been questioned if any of the other ballads of Europe, even the Scottish and Spanish, can sustain a comparison; and some enthusiastic critics have even contended that nothing approaching them has appeared since the days of Homer. It is one of the most interesting features of the phenomenon that several of the ballads are of entirely recent origin, some of them celebrating the exploits of Kara-George against the Turks in the first ten years of the present century; and several of these are known to be the productions of a blind bard named Philip, who, on one occasion, was presented with a white horse by a Servian chief, in reward for a poem in which he had sung one of his battles. Karajich, who had learned many of the poems by heart when a boy, and committed others to writing when hearing them recited by wandering minstrels at the court of Kara-George, travelled to Montenegro and Bosnia in his quest, and found that even the Bosnian renegades, who are noted as the most ferocious Mohammedans of Western Turkey, could supply him with snatches of Servian song. He had greater difficulty in collecting the numerous love-songs of the Servian women, which they generally refused to recite, if they knew he intended to write them down, and which he therefore persuaded them to go over two or three times, till he had committed them to memory sufficiently well to pen them during their absence. His collection of Servian popular poetry was first issued at Vienna in 1814-15, in two volumes; a second edition in four volumes appeared at Leipzig and Vienna between 1823 and 1833; and a third, more extended than either of the preceding, at Vienna in 1841-46. The work has never been entirely rendered in any foreign language, but large selections were translated into German, and published under the assumed name of Talvj, by Therese von Jacobs (now Mrs. Robinson, wife of Professor Robinson of Andover, in the United States); by Gerhard, by Kapper, and others; and Bowring issued in 1827 his small but valuable volume, entitled 'Servian Popular Poetry,' containing translations of about a fifteenth part of the collec-

tion. At nearly the same time with the ballads, Karajich published a Servian grammar, which received the high honour of being rendered into German by Jacob Grimm, and displayed a singular talent for simplifying the rules of the language. In 1818 he issued a Servian and German dictionary, of which, in 1852, he published a second edition. By these works he endeavoured to aid in putting an end to the pedantic custom which prevailed in Servia of using for the language of literary composition the dialect called the 'Church-Servian,' and of bringing into use the ordinary language of the people—an object which had been aimed at before him by Dositheus Obradovich, but which Karajich is regarded as having done by far the most towards promoting. In these works he adopted a system of orthography proposed by himself, and founded on the Russian alphabet, with some modifications, while Gaj [GAJ], who has since been attempting to induce the scattered Servian races to sacrifice peculiar dialects to the advantage of possessing a central language, has proposed another system of orthography, based on the Latin alphabet. In addition to these important labours, Karajich is also the author of a Servian translation of the New Testament, which was published at Vienna in 1847 by the British and Foreign Bible Society. It was taken from the old Slavonic version, which is in use by the Russians, who still retain the Slavonic as their ecclesiastical language.

By the publication of a Servian literary almanac, or annual, entitled 'Danitzs' ('The Dawn'), 5 vols., Vienna and Buda, 1826-34, and the 'Kovchejich,' or 'Casket for the Servian Language and History' (one number only, Vienna, 1849); by his 'Life of Prince Miloah,' the successor and slayer of Kara-George, and by a work in German, 'Montenegro und die Montenegriner,' he has supplied valuable materials for the study of the interesting race to which he belongs. He has also given forth a collection of Servian Proverbs, which has reached two editions (the last in 1849, at Vienna), and 'Servian National Tales' (Vienna, 1853), which has been translated into German by his daughter Wilhelmina Karadschisch (Berlin, 1854). Since the restoration of the freedom of Servia, he appears to have divided his time between his native and Germany his adopted country, where he has been elected a member of the academies of Göttingen, Berlin, and Vienna, and has received the degree of Doctor of Philosophy from the University of Jena. He is also member of the St. Petersburg, and almost all the other Slavonic academies; and shortly after the publication of his Servian ballads, was assigned a pension by the emperor Nicholas of Russia.

KARAMSIN, NIKOLAI MIKHAELOVITCH, one of the most eminent writers that Russia has yet produced, and the one to whom its literature is mainly indebted for the popularity it has acquired, and the rapid progress it has made since the commencement of the present century, was born in the government of Simbirsk, December 1st, 1765. Having completed his education at Moscow, he served with a commission in the Guards, and in 1789-91 visited Germany, Switzerland, Italy, France, and England, which tour he has described in his 'Letters of a Travelling Russian,' of which there exists an English translation, or rather a copy of the German one. On his return to Moscow he devoted himself entirely to literature, one of his first undertakings being the 'Moscow Journal,' which was succeeded by 'Aglais,' the 'Pantheon,' and the 'Vestnik Europy,' or European Intelligencer (1802). Besides various narratives and other papers, both original and translated, these publications contained many articles of criticism by him, and were well calculated to promote a love of reading among all classes of his countrymen. These however were comparatively insignificant productions, chiefly remarkable for careful polish and correctness of style. The great work to which he entirely devoted himself from 1803 to his death, is his 'History of the Russian Empire,' which however he did not live to complete beyond the eleventh volume. This laborious task, which may in more senses than one be said to be the very first historical work in Russian literature, is a monument both of diligence and genius. The labour of collecting and arranging the vast mass of materials requisite for it must have been immense, yet never was historian more liberally repaid by the enthusiasm with which his work was instantly received. Its sale and popularity were unprecedented; it was to be seen everywhere, in the hut of the peasant and the palace of the noble; and in spite of all the imperfections that the utmost rigour of criticism has been able to allege against it, it is captivating and interesting to all who are capable of perusing it in the original, whether foreigners or natives. It has been translated both into German and French. The first edition, comprising the first eight volumes (1816), produced him the sum of 100,000 rubles, also the title of counsellor of state, and the order of St. Anne, which were bestowed on him by the emperor Alexander. Karamsin died in the Tauridan palace, where apartments had been assigned him, June 3rd, 1826. The emperor munificently bestowed on his widow and family a yearly pension of 50,000 rubles.

His merits and celebrity as an historian and a prose writer have so completely eclipsed his reputation as a poet, that he is scarcely ever considered in that character, notwithstanding that his poetical pieces are not without their value.

* KARR, JEAN-BAPTISTE-ALPHONSE, the son of a music master of some distinction, was born at Paris (some accounts say at Munich), in 1808. After leaving the university, he became teacher of the fifth class at the Collège Bourbon, in the French capital; where he

spent most of his leisure hours in writing poetry. The merit of these first attempts appears to have been but small. Having converted one of his poems into a prose romance, it appeared in 1832, under the title of 'Sous les Tilleuls,' and partly from the German sentiments with which it abounds being then a novelty, it became immediately very popular. Many of the chapters of this fiction still exhibit their original poetic character. In this romance, as in most of his productions, Alphonse Karr has shown much ingenuity and some original power, whilst his style, language, and moral purpose, are unobjectionable. It was followed in 1833 by 'Une Heure trop Tard,' by 'Fa Dièze' in 1834, and by 'Vendredi Soir' in 1835. The following year he produced 'Le Chemin le plus Court,' in which the private history of his own married life was unveiled to the public curiosity, and a great sensation effected thereby. Few of the contemporary French writers have exceeded M. Karr in this habit of communicating to the reader their own personal history.

'Genevieve,' published in 1838, 'Clotilde' in 1839, 'Hortense' in 1842, and 'Am Reuchen' in the same year, compose a series of very pretty tales, under the general title of 'Ce qu'il y a dans une Bouteille d'Encre;' 'Genevieve' and 'Hortense' being still popular, and several times reprinted. 'Fou Bressier' appeared in 1844, and his 'Voyage autour de Mon Jardin' in 1845. 'La Famille Alain,' another ingenious story, appeared in 1848, followed a few months later by 'Le Livre des Cent Vérités.'

Besides the above list of domestic tales, M. Karr has been attached, sometimes as originator and proprietor, at other times, as editor or contributor, to various periodicals. After writing several years for 'Figaro,' he published, in the form of a monthly magazine, a satirical work, called 'Les Guêpes,' the first number of which came out in November 1839. There was a great display of wit and smartness in 'Les Guêpes,' but many things were reprinted in them, which the reader knew already, and the author's egotism was never more conspicuous, than in this serial. The freedom of his invective, likewise, gave offence to several of those writers who were brought within the range of his criticism, and one lady especially was so much irritated by the unparing censure with which he examined her poems, that she concealed herself one evening in the street where he resided, and slightly wounded him in the back with a poniard. This adventure happened in 1844, and was at the time much talked of. M. Karr has of late years devoted much of his attention to horticulture, on which subject he has written many interesting articles for the monthly serials, besides some clever reports for the annual exhibitions of plants and flowers. He was created a Chevalier of the Legion of Honour by Louis Philippe. His 'Voyage autour de Mon Jardin,' in which he has made clever use of his knowledge of plants and flowers, has been translated into English.

KATER, HENRY, an English mathematician of some eminence, and an excellent practical philosopher, was born at Bristol, April 16, 1777, but of his early life very little is known. He obtained a commission in the army; and in 1808, while holding the rank of lieutenant in the 12th regiment (infantry), he became a student in the senior department of the Royal Military College, Sandhurst. During his residence at that institution he was promoted to a company in the 62nd regiment; and on quitting the college he received a certificate of the first class. He was afterwards made brigade-major of the eastern district.

Captain Kater was first engaged in making experiments to determine the relative merits of reflecting telescopes constructed according to the methods of Cassegrain and Gregory; and his conclusion was that the ratio of the illuminating power of the former to that of the latter kind was two-and-a-half to one. On this subject he wrote two papers, entitled 'On the Light of the Cassegrainian telescope compared with that of the Gregorian,' which were published in the 'Philosophical Transactions' for 1813.

The determination of the precise length of the seconds' pendulum, an object of high importance in physical science, engaged the attention of Captain Kater during several years. The methods which had previously been employed to determine accurately the centre of oscillation in an irregular and heterogeneous body vibrating as a pendulum were found totally inadequate to this purpose; but Captain Kater succeeded in surmounting the difficulty by availing himself of a property of that centre which had been demonstrated by Huyghens: this property is that, if the centre of oscillation in a suspended body be made the point of suspension, the body will perform a vibration about it in a time equal to that in which it performs a vibration about the original point of suspension. The distance between the two points, experimentally obtained, is evidently equal to the length of a mathematical pendulum vibrating in the same time as the given pendulum. The 'knife-edge' mode of suspension was first used by Captain Kater in these experiments; and the details of the construction of the pendulum are contained in a paper which was published in the 'Philosophical Transactions' for 1818. A bill having been introduced into parliament for establishing a uniform system of weights and measures in this country, Captain Kater distinguished himself by the experiments which he made to ascertain the length of the seconds' pendulum, for the purpose of assigning the physical value of the English foot; and these experiments gave for the length of such pendulum, in London, in vacuo and when reduced to the level of the sea, 39.13929 inches. At the request of the Royal Society of London,

Captain Kater proceeded, with the instruments, in July 1818, to Dunnoose in the Isle of Wight, to Arbury Hill, Clifton, Leith Fort, Portsoy, and the island of Unst, where he made the necessary experiments; and he subsequently computed for those places the several lengths of the seconds' pendulum: an account of the experiments, with the computed results, was published in the 'Philosophical Transactions' for 1819. Captain Kater also investigated, by the aid of Clairaut's theorem, the diminution of terrestrial gravity from the pole to the equator; and the great accuracy with which the force of gravity may be determined by means of his pendulum suggested to him the application of the latter to the important purpose of finding the minute variations of that force in different parts of a country whose substrata consist of materials having different degrees of density.

But the name of Captain Kater will be transmitted to posterity in connection chiefly with his invention of the floating collimator, an instrument which has conferred on practical science essential benefits, its object being the determination of the position of the line of collimation in the telescope attached to an astronomical circle; and this end is obtained by the collimator with greater certainty than by the spirit-level, the plumb-line, or by the reflection of an object from the surface of a fluid. Accounts of Captain Kater's horizontal and vertical collimators are given in the 'Philosophical Transactions' for 1825 and 1828.

The 'Philosophical Transactions' contain also a paper by Captain Kater on an improved method of dividing Astronomical Circles and other Instruments; one on the length of the French Metre estimated in parts of the English Standard; one on a remarkable Volcanic Appearance in the Moon in February 1821; two papers on the comparison of British Standards of Linear Measures; one paper entitled 'An Account of Experiments made with an Invariable Pendulum belonging to the Board of Longitude;' and two papers on the 'Construction and Adjustment of the New Standards of Weights and Measures in the United Kingdom of Great Britain and Ireland.'

Besides these valuable papers, Captain Kater was the author of a large portion of the work entitled 'A Treatise on Mechanics,' constituting one of the volumes of Dr. Lardner's 'Cyclopaedia'—this volume being the joint production of Lardner and Kater. In it is a chapter on the subject of pendulums constructed on the principle above mentioned; and it may be observed that, for the purpose of measuring the distance between the knife-edges, Captain Kater employed a scale furnished with powerful microscopes, to one of which a micrometer was adapted: with this apparatus the 10,000th part of an inch becomes a measurable quantity. He published in 1832 'An Account of the Construction and Verification of certain Standards of Linear Measures for the Russian Government,' 4to, London.

Captain Kater was a Fellow of the Royal Society of London, and in 1814 he received from the Emperor of Russia the decoration of the Order of St. Anne. After a life spent in philosophical research, he died in London, April 26, 1835, leaving behind him many proofs of his zeal for the promotion of physical science.

KATONA, ISTVÁN, or STEPHEN, the most minute and careful historian of Hungary, was born on the 13th of December 1732, in the county of Nograd, entered the order of the Jesuits in 1750, was afterwards Professor at the University of Buda, of Poetry, Rhetoric, Homiletics, Universal History, and the History of Hungary, and died on the 17th of August 1811. He was the author of several works in Latin and a few in Hungarian, but his great work is the 'History of Hungary,' in Latin, in forty-one octavo volumes. In it he carries the annals of the country from the earliest period to the year 1801, in which the forty-first volume was published. At that time however a large gap was left in the history for the reign of Leopold I., and of some other sovereigns which were already written, but which he could not obtain permission to publish,—this permission however was subsequently given, and he lived to see the last volume through the press just previous to his decease. The work which is written with considerable spirit and in lucid Latin, is the first book to consult on Hungarian history, and it adds its value that the author gives at intervals biographical and bibliographical notices of Hungarian authors. A shorter history of Hungary by the same author in three volumes affords a reader means of arriving at his results, but in any great library the larger work is indispensable.

KAUFMANN, MARIA ANGELICA, was born at Chur in the Grisons, or Graubünden, in 1741 or 1742. Her father, Joseph Kaufmann, was a portrait painter, of very ordinary ability; he however devoted unusual attention to the education of his daughter, who displayed uncommon abilities at an early age, both for painting and for music. He took her, while still young, to Milan, where they dwelt some time; and in 1763 they visited Rome, and there Angelica attracted general notice among the virtuosi, and obtained considerable reputation for her portraits in oil: in singing too, according to Winkelmann, she was equal to any of her contemporaries. She painted a half-length of Winkelmann and made an etching of it herself. Winkelmann, in a letter to a friend, speaks in admiring terms of Angelica's accomplishments, especially her facility in speaking the German, Italian, French, and English languages.

In 1765 Angelica visited Venice, and in the same year came in

company with Lady Wentworth to England, where she was received in a most flattering manner: she was elected one of the original thirty-six members of the Royal Academy, founded in 1768. She returned to Italy in 1782, having in the previous year been married to Antonio Zucchi; she did not however change her name, but was always known as Angelica Kaufmann. She died at Rome in 1807, or according to some accounts in 1808. She etched several plates, and many of her own works have been engraved by Bartolozzi and other eminent engravers. Angelica is said, previously to her marriage with Zucchi, to have been cheated into a marriage with an adventurer who gave himself out as a Swedish count: as the story, however, though often repeated, does not appear to be sufficiently authenticated, an allusion to it is sufficient. The account of her which appeared in Huber's 'Mannuel des Amateurs,' &c., in 1796, was declared to be wholly incorrect by Angelica herself, in an Italian periodical in 1806; but the story of the impostor does not occur in this notice.

Angelica, though not beautiful, had a graceful person and agreeable manners, and she was very highly accomplished generally. To these attractions must be attributed her success, for as a painter she did nothing of value beyond an elegant female portrait, or an occasional female figure. Her compositions are deficient in every essential quality of art; in drawing she was extremely feeble, and her male and female characters are hardly otherwise different than in costume. There is a large allegorical painting 'Religion attended by the Graces' by her in the National Gallery.

(Göthe, *Winkelmann und sein Jahrhundert*; Fiorillo, *Geschichte der Zeichnenden Künste in Deutschland*, &c.; Nagler, *Künstler-Lexicon*.)

*KAULBACH, WILHELM, Director of the Academy of Art at Munich, was born on the 15th of October 1804, at Arolsen in Waldeck. He was at first set to learn his father's business, that of a goldsmith, but his aversion to it being very decided, he was transferred to a farmer with equally little success; when, after a brief trial, his father yielded to his strong inclination for painting, and placed him in the Düsseldorf Academy, then under the direction of Cornelius. There he highly distinguished himself, and so secured the esteem of his master that when Cornelius had been called to Munich he requested that Kaulbach might be invited to assist him in painting the grand series of frescoes entrusted to his hands. [CORNELIUS.] Kaulbach accordingly went to Munich in 1825, where he painted, among other things, six symbolic figures in the open arcade on the west side of the Hofgarten—some of the earliest works in the revived art of fresco; 'Apollo with the Muses,' on the ceiling of the Odeon; and several of the designs on the walls of the Glyptothek, &c. It was thought that Kaulbach caught more happily the poetic and symbolic manner of Cornelius than any other of that great master's pupils; but at the same time, by close study of nature and wide reading, he succeeded in preserving his individuality. A proof that he could paint an original design with at least as much ability as he could reproduce one from the cartoon of his master was early given in his famous 'Irrenhaus,' painted in 1828-29, in which he has represented with great power and distinction of character the various aspects of lunacy, from studies made some years before in the Lunatic Asylum at Düsseldorf: Raczyński has given an engraving of this work in the Atlas to his 'Histoire de l'Art Moderne en Allemagne.' He further sought to strengthen his powers of observation in these earlier years by a diligent study of the works of Hogarth, to whom he was wont to acknowledge himself in no small measure indebted; and evidence that he had not studied him without catching something of his spirit as well as his manner, may be seen in his 'Der Verbrecher aus verlorener Ehre,' in which, whilst all the figures are remarkably true to nature, the justice, the clerk busy writing, and one or two others, are quite Hogarthian in quaint characteristic humour of attitude and expression. Still Kaulbach directed his attention mainly to poetic subjects, in which, following the example of Cornelius, the symbolic mode of treatment was predominant. One of the most remarkable of his works, after he had released himself from pupillage, was his 'Hunnenschlacht,' founded on an old poem, in which the souls of the Hunnish heroes, whose bodies lie dead under the walls of Rome, are represented as continuing the combat in the air. As soon as his eminent original ability was fully recognised, Kaulbach was employed by the art-loving King Ludwig to take a share in the decorations of his new palace (Neue Königsbau) in Max Joseph's Square, Munich—the queen's apartments being especially entrusted to him. The Throne-room he adorned with paintings from the masterpiece of Klopstock; those on the walls being executed in fresco, the ceiling in encaustic. The drawing-room he filled with designs from Wieland, executed wholly in encaustic; the architectural decorations being also designed by Kaulbach to accord with the paintings. Here however only the designs were by Kaulbach, the actual painting of this room being executed chiefly by his pupils Förster and Neureuther. For the State Bed-room he made a series of thirty-six very elaborate designs from Goethe: these he painted chiefly with his own hand, the walls, as in the Throne-room, being painted in fresco, the ceiling in encaustic.

But though the early triumphs of Kaulbach were won in fresco, he has in his later years more and more devoted himself to painting in oil. His grandest work in oil—that probably on which he would himself be most disposed to rest his fame—is his 'Zerstörung Jerusalems durch Titus,' a vast work some 17 feet by 19 feet (English), and one

in which he has given full play to his imagination. As a representative of the symbolic treatment of history—that union of the ideal with the real, which the great German masters have so enthusiastically inculcated—as opposed to the strictly realistic manner adopted almost exclusively by English artists, it may be worth while to give a very brief description of this work. The destruction of Jerusalem is shown by a representation of Titus planting the Roman eagle on the high altar, whilst above are seen the five prophets who foretold the final fall of the Temple and dispersion of the Jews. Recognising the accomplishment of the prophecies, the priests are killing themselves in their despair, and the Jewish women are lamenting the pollution of the house of the Lord and the calamities which have fallen upon their race. On the other hand, the future triumph of Christianity is shown by the intervention of angels, who are seen conducting the Christians in safety out of the doomed city. These are however only the prominent points of the picture: this idealistic treatment—a manner of regarding an historic event which compels the spectator to lay aside what has been a good deal spoken of lately as “the common-sense way of looking at a picture,” if he would at all enter into the artist’s conception of the work—is carried out in every part of the composition, and by no means neglected in its colouring. In addition to his fresco and oil-paintings, Kaulbach has made numerous designs for the engraver. Of these, the most remarkable is the well-known series illustrating in so striking a manner Göthe’s ‘Reineke Fuchs.’ Kaulbach has of late years a good deal devoted himself to portrait painting.

KAUNITZ, WENCESLAS, PRINCE OF, an Austrian statesman, was born at Vienna in 1710. Being one of nineteen children, he was educated for the Church; but the deaths of his elder brothers occasioned a change in his vocation, and he became chamberlain in the palace of the Emperor Charles VI. His talents, which were enhanced by an agreeable person and calm reflective habits, soon marked him out as fitted for the career of diplomacy. He was made a minister of state in 1744 for the kingdoms of Hungary and Bohemia. Being sent to the congress of Aix-la-Chapelle in 1748, he signed the treaty of peace in the name of Austria, for which the Empress Maria Theresa honoured him with the order of the Golden Fleece. His next mission was to France, where he was sent as ambassador in 1750. He continued at the court of Louis XV. until 1753, and obtained so much influence over the mind of that monarch by the assiduities he paid to the favourite, Madame de Pompadour, that he baffled the manoeuvres of the Prussian envoy in the same quarter, and founded an alliance between France and Austria. When he returned home he was made chancellor of state, the empress feeling that no proofs of confidence were too great for a minister who had so skilfully disabled her most powerful enemy by depriving Prussia of the ally on whom she chiefly relied. Nor was the resentment of Frederick II. less decided; his hatred of Kaunitz was strongly expressed even in his ‘Memoirs.’ After concluding the treaty of alliance between France and Austria in 1756, Kaunitz received his title as prince of the German empire in 1764, and accompanied Joseph II. in 1770 when he had an interview at Neustadt with the King of Prussia. But though a successful diplomatist, Kaunitz has been reproached with having instigated the government of Joseph II. to introduce very serious innovations in the ecclesiastical régime of his dominions.

In private life, Kaunitz’s taciturnity was often felt and interpreted as disdain towards his associates in office; but he had great personal qualities—never lending himself to the envy of other men, or to his own desires of vindictiveness. Prince Kaunitz was acquainted with the Latin, French, Italian, and English languages, as well as with the German; he founded several academies and schools of art, and was a patron of literary men and artists, with whom he lived on terms of equality. His probity and honour were unimpeached. He was the faithful servant of four Austrian sovereigns, Maria Theresa, Joseph II., Leopold II., and Francis II.; and no minister at that court ever enjoyed greater or more enduring credit. He died of a neglected cold, June 24, 1794.

* **KAY-SHUTTLEWORTH, SIR JAMES PHILLIPS**, was born July 20th 1804; and having received his early education at Scotch and foreign universities, he took his degree of Doctor of Laws. He entered the public service at an early age, and when the committee of the Privy Council on Education was nominated, Dr. Kay was appointed secretary to that body. In this capacity he laboured for many years to carry out the principle of admitting the lay as well as the clerical element to a share in the management of parochial schools, in opposition to the claims of exclusive clerical control put forth by Archdeacon Denison and the High Church party, who raised an agitation of several years’ duration against the imposition of the ‘management clauses,’ as they were termed. These clauses were first rendered compulsory on all schools whose managers petitioned for the assistance of government grants in 1847, and the terms upon which that assistance is given to all religious denominations are now such as are generally acquiesced in by all. It would be useless and profitless to detail here the successive stages of a controversy which was protracted over several years; it is enough to state that, having carried the controversy to a victorious issue, Dr. Kay was rewarded with a baronetcy on his retirement from his official position as secretary of the Committee of the Privy Council for Education in 1850. In 1842 he married Janet,

only daughter and heiress of the late Robert Shuttleworth, Esq., of Gawthorpe Hall, Lancashire, and representative of the ancient family of Shuttleworth, whose name he then assumed by royal licence. Although retired from official services, Sir James Kay-Shuttleworth has continued to take an active interest in all educational movements; and his name is usually found in the lists of those who promote and take part in public meetings for the extension of education, the establishment of libraries, &c., especially in the north of England.

KAZINCZY, FERENCZ, or FRANCIS, the most active and successful contributor to the restoration of Hungarian literature and the Hungarian language, was born on the 27th of October 1759, at Er-Semlyén, in the county of Bihar. For the first ten years of his life he resided with his parents, who were Protestant and noble, at Lower Regmecz, where he heard no language spoken but the Hungarian. Before the age of ten his propensity for authorship had developed itself in a singular manner. His father, though not yet forty, was in the habit of telling long stories after dinner, which the rest of the company found rather tedious, but which so struck the imagination of the boy that he secretly committed them to writing. His tutor discovered the manuscripts, and showed them to the father as a sad proof of the way in which the boy was wasting his time; the elder Kazinczy looked over them with complacency, and returned them with the remark, “My son will be a great author,”—a prophecy which turned out true. At that time the nobles of Hungary placed all their hopes of distinction in the field of sport or the field of battle, while the nobles of Transylvania were noted for a fondness for seeing their names on the title-page of a book either as authors or dedicatees. The elder Kazinczy, full of the future fame of his son, was smitten with the Transylvanian mania, and anxious to see him in print; and before he was fifteen, Ferencz, nothing loth, had a work in the press of translations from the German of Gellert, some of whose works had fallen into his hands by accident; though German literature was at that time so little known in Hungary that even the names of Wieland and Klopstock had not penetrated through the barrier of ignorance that guarded the frontier. Before the volume was completed, young Kazinczy had the misfortune to lose his father, who died in 1774, but his mother was no less anxious for its appearance, and under her auspices he was an author before he was sixteen. Long previous to this time, at the age of ten, he had been sent with two of his brothers to the high school of Patak, which he did not leave till 1779, when he was twenty. The school of Patak was conducted at that period in a very eccentric manner—one of the professors who lectured on universal history took eighteen years to make his way to the end of the third century, much of course to the edification of his pupils. When Kazinczy left it he was provided with a good knowledge of the classics, to which he added an acquaintance with French and German, which he had acquired elsewhere. He went to Caschau to study law, but the profession of advocate did not please him, and he was fortunate enough to receive from one friend, Count Lorincz Örczy, the post of official notary to one of the counties, and by the recommendation of another, Count Lajos Török, that of inspector of schools, a position which exactly answered his wishes.

The ten years of the reign of Joseph II., from 1780 to 1790, were a period of singular changes in Hungary, as well as in the rest of his dominions. In 1784 the emperor issued his decree for the introduction of German as the official language of the country in place of Latin, a decree which had a strong influence in promoting what it was intended to crush. Among the cultivators of the language which the sovereign aimed at extirpating, Kazinczy was perhaps the most enthusiastic, and he was ever remarked for the singular beauty of his style and the tact with which he enlarged the domain of the language. The Hungarian is very distinct in its origin and in much of its formation from the other cultivated languages of Europe; it does not belong to the Indo-European family, which embraces such varying idioms as Greek and English, Spanish and Russian, but to a family which has been sometimes called the Tartarian, the Turanian, and the Sæthitic, and which comprises, along with the Hungarian, the Turkish, the Finnish, the Mongol and Manchoo Tartar, and various others. With these however it bears very little affinity in its vocabulary, though much in its grammar. From long disuse as a language of composition for anything but books of devotion, it was at the time that Kazinczy began to cultivate it destitute of many of the terms most necessary to express the common ideas of the 18th century. To display and extend its powers, he set himself to translate into it some of the leading masterpieces of the French and German drama, and also of the English, but as seen through a German medium, for his ‘Hamlet’ was taken not from Shakspeare but from Schroeder, which is Hamlet with the poetry omitted. To these he added Marmontel’s Tales and Ossian’s Poems. His friends urged him to original composition, but he replied that he would rather be a good translator than a bad original, and with the object that he had in view, that of refining and expanding the language, it is probable that his course was a right one. To those who objected to his numerous new words and phrases, and complained that the public would not understand him, he replied in the words of Klopstock to Basedow on a similar occasion, “Let them learn to understand me.” It has been remarked by Mr. Watts of the British Museum, in a paper on the modern Hungarian, read before the London Philological Society, that

he carried his point, and that "few men have ever had so large a share in the formation, it might almost be said in the manufacture of a language," as Kasinczy. He was distinguished from his namesakes among his own kin as "Kasinczy a nyelvfaragó," Kasinczy, the language-carver. While busy with his translations he did not omit to employ for his purpose the influence of periodicals. He established at Caschau in 1788, with his friends Szabo and Bacanyi, the first Hungarian magazine, the 'Magyar Múzeum,' which has left so good a memory behind it that the leading magazine now published at Pesth, the 'Uj Magyar Museum,' or 'New Magyar Museum,' is named after it. The editors however did not agree, the work came to an end, and Kasinczy then published alone the 'Orpheus' in 1790. In that year the emperor Joseph died; his decrees against the Hungarian language might be said to have died before him, and many of his other innovations were at once rescinded. Kasinczy lost his post of inspector of schools on the ground of his being a non-Catholic, but he was encouraged to hope for another place in compensation. After the short reign of Leopold he presented himself as a petitioner to the emperor Francis when he came in June 1792 to be crowned at Buda as king of Hungary, and the emperor told him that the place he asked for had been given to his friend Hajnocy. "Your majesty," replied Kasinczy, "could not have chosen a better man." Struck with his generous spirit the king replied, "If I see you ten years hence I shall not have forgotten your words, and to show how I appreciate them I will appoint you to any other post you name." Probably no other eligible post was at that time vacant, for the first favour that the king had an opportunity of granting the author appears to have been his rescue from the scaffold. Hajnocy engaged in what is called the "Jacobin conspiracy" of Martinovic, a plot, the history of which is still enveloped in much darkness, but which at all events involved the formation of secret societies who distributed catechisms of the rights of man, which in those days the ruling powers might be expected to view with suspicion. The principal members were men of learning and attainments; Martinovic, the leader, enjoyed from the court the revenues of the abbey of Sasvar, and was director of the royal cabinet of natural history. When the conspiracy was discovered, Kasinczy, who had been led into it by Hajnocy, was arrested at his mother's residence at Lower Regmecz, on the night of the 14th of December 1794, and carried to Buda for trial. One of his fellow-prisoners, who was father of a family, implored him to be firm and not to disclose anything as the result would be general ruin, Kasinczy therefore denied all knowledge of anything treasonable in the first instance and afterwards found that this very father of a family had himself given way and made a merit of denouncing him. He then revoked his former denials and threw himself on the mercy of the king. On the 8th of May 1795 he received sentence of death, he appealed, and the sentence was confirmed by a superior court. Finally, after a period of trying suspense, Martinovic, and six others, one of whom was Hajnocy, were beheaded at the castle of Buda, and the sentence of the remainder, of whom Kasinczy was one, was commuted to imprisonment "till they had shown signs of sufficient penitence."

Kasinczy spent in the dungeons of Buda, Brunn, Kafetein, and Munkacs the long period of 2387 days. At first his confinement was very severe, he passed some of the early months at Brunn in a damp underground dungeon, where his limbs became so crippled that he could not rise from his bed of straw, but wherever he went he gained the good will of his keepers, indulgences were more and more allowed him, and at last he spent some of his hours of imprisonment in translating Sterne's 'Sentimental Journey,' in the course of which the well-known passage on the Captive must have forcibly struck him. We are told in the tenth edition of the 'German Conversations-Lexikon' that a diary of his imprisonment was published at Pesth in 1848, the year of the Hungarian revolution, by Yahot. In the collection of his familiar letters published in 1843 and 1845, there is very little allusion to this gloomy hiatus in his career. Soon after his liberation in 1801 he married Sophia, the daughter of his old friend and patron Count Lajos Török, and for the remainder of his life he was established at his country-residence in 'Széphalom,' or 'Fairhill,' in the neighbourhood of Tokay, a name which has become classical to the cultivators of Hungarian letters. He saw springing up around him a literature every year growing in extent and value, couched in the very language which he had had so much hand in forming, and his voice was the most influential in the award of Hungarian fame. He was a frequent contributor to the Hungarian periodicals, the 'Erdelyi Múzeum' and the 'Tudományos Gyűjtömeny,' and to the Vienna 'Jahrbücher der Litteratur,' and his attention was always alive to any new appearance in the field of Hungarian poetry. He was the friend of almost every author of note, of Alexander Kisfaludy till the freedom of his criticisms offended him, and afterwards of Charles Kisfaludy at his own eager request. He edited the works of Dajka, Baroczi, and Kis, and of Zrínyi the poet, as he is called to distinguish him from his ancestor Zrínyi the warrior, and he published a volume of reprints of old Hungarian grammars under the title of 'Magyar Regisegek es Ritkasagok,' or 'Magyar Antiquities and Rarities.' His own poems are chiefly of the class of Horatian epistles, in which a mild philosophy and a system of aesthetics are illustrated and enlivened with frequent references to his personal experience, but one set of short poems under the title of 'Tóviszós

Viragok,' 'Thorns and Flowers,' is of a more epigrammatic and lively character. He was fond altogether of the epistolary form—his chief original prose work, the 'Erdelyi Levelek,' or 'Transylvanian Letters,' is an account of a tour in Transylvania which he effected in 1810, and which he thus described to give him a better opportunity of intermingling his own personal recollections with the narrative. These letters however, which were originally intended for the press, are not so attractive to read as his real correspondence with his friends. Kis and Szent Györgyi, the former himself a poet of some note, in which there is a running commentary on the progress of the Hungarian language and literature for a period of about forty years, intermingled with glimpses into the interior of a happy home enlivened by the presence of a large and united family. On the whole, cheered by the constant progress of Hungary, his life passed happily, and surrounded by honours. The only great drawback to his welfare was a lawsuit, in which, after the death of his father-in-law, he was obliged to engage with his wife's brother for his wife's inheritance.—It was decided in his favour in 1829 after a contest of nineteen years, but as he mournfully observed, "nineteen years are gone,—my children have not had the education that I should have given them otherwise, I have not led the easy life that I should have led, had I been able to draw my income, and I have been plunged in debts, out of which I shall never emerge." On the establishment of the Hungarian Academy in 1830—an event which he saw with joy—he was the first elected member. In 1831 he published his last work, 'A Tour to Pannonhalmá.' The appearance of the cholera drove him home, and in Hungary the cholera led to savage outbreaks on the part of the peasantry, who attributed the epidemic to a conspiracy of the upper classes. On the 18th of August he wrote to a friend, "I and mine are still alive—but in what times!" Four days afterwards the cholera carried him off. He died, says the author of his life in the 'Ujabbkori Ismeretek Tára,' from which much of our narrative is taken, "in the twenty-second year of his life and the fifty-sixth of his authorship."

The fame of Kasinczy appears to be rather on the rise than the ebb. "We are more in want of a Kasinczy now," says the Hungarian writer already quoted, "than we were twenty years back." There are two so-called collections of his works, but the first in nine volumes published between 1814 and 1816 contains little but translations; the second commenced in 1836, but still incomplete, having been apparently stopped by the revolution, contains his letters published for the first time after his death, and which now seem likely to preserve his memory better than any of his more elaborate writings. This collection is edited by Schedel and Bajza. One of his nephews, GABOR or GABRIEL KASINCZY (born in 1818) took an active part in the revolution of 1848, but was fortunate enough to be included in the amnesty after it, and is now engaged at Pesth in historical researches. He is the author of 'Malvina, a tale,' of some translations from Ossian, and an active writer in the periodicals.

KEAN, EDMUND, was born about 1787, in London. His father, Edmund Kean, seems to have been a stage-carpenter; his mother was Miss Ann Carey, an actress at minor theatres and with strolling players and in showmen's booths. Kean's father seems to have cared little about him, his mother neglected him, and when he was two years old Miss Tidswell, an actress at the large theatres, who was acquainted with Miss Carey, took charge of him, and, probably from this circumstance merely, was reported to have been his mother. He was sent to one or two day-schools in London, but, as may easily be supposed, got little literary instruction. His theatrical education however commenced early: Miss Tidswell instructed him in her art, and his mother, as soon as she found that he might be made useful, took him with her in her occasional occupation of selling flowers and perfumery from door to door; and she afterwards took him with her in her rambles with strolling players and showmen; and Master Carey, as he was then called, was so clever, that once, when Miss Carey and her son were performing in Richardson's booth at Windsor, Master Carey was required to give his recitations before George III. at the Castle, which he did to his Majesty's great delight, and was dismissed with a handsome present. He continued his performances, sometimes with his mother and sometimes alone, at small places of public amusement in London and the neighbourhood till about the age of sixteen, when he left her entirely, and joined a company of strollers in Scotland.

From this time till 1814, when he made his first appearance at Drury-Lane Theatre, London, his life was a series of the vicissitudes, struggles, and privations incident to the profession of an actor in country theatres. Meanwhile he had, in July 1808, married Miss Chambers, an actress in the same company in which he had obtained an engagement at Gloucester. At length the play-bills of Drury-Lane announced 'The Merchant of Venice,' 'Shylock' by Mr. Keon from the Exeter Theatre. There had been no previous puffing, and the house was thinly attended, but the applause was tumultuous; he repeated the character; the house was well filled, and his fame was thenceforth established. On his first night 164*l.* were paid at the doors; on the second, 324*l.*; afterwards the average was upwards of 500*l.*; and the actor's fame, it is needless to add, was secured. His salary was at once raised to 20*l.* a week; and not long afterwards the committee made him a present of 500*l.*; he also received many valuable presents from individuals. Drury-Lane Theatre was saved from the ruin which

had previously threatened it, and rapidly advanced to a state of unexampled prosperity.

Kean's career of success, including a visit to America in 1820, was uninterrupted till his connection with the wife of Alderman Cox, and the consequent action at law, January 1825, with the verdict of 300*l.* damages pronounced against him. The public now became exasperated against him, and he was driven from the stage of Drury-Lane and afterwards from that of Edinburgh. After some time however he was allowed to go on with his performances at Drury-Lane, but he failed to reinstate himself in his former position, and therefore gladly accepted an invitation to pay a second visit to America.

After an absence of two seasons in the United States Kean returned to London, having during the time not only acquired but saved a considerable sum. The London public had relinquished their animosity, but it was in vain. He had always, in the time of his prosperity, been a dissolute man, but he had now fallen into habits of almost constant intoxication. His constitution was broken up, his memory was impaired to such a degree that he could not study a new part, his alacrity of spirit was gone, and his performances were little more than a faint reflection of what they had been. He had separated from Mrs. Kean, he had quarrelled with his son Charles, who was obliged to take to the stage in order to obtain the means of subsistence. Charles Kean was a year or two in America; after his return his father became reconciled to him; and in 1833 it was announced that Kean would play 'Othello,' at Covent Garden Theatre, and that Charles Kean would play 'Iago' with him. Kean struggled through the part as far as the speech "Villain, be sure," when his head sunk on his son's shoulder: he was borne off the stage, and his acting was at an end: the audience in kindness immediately left the theatre. Kean lingered on at his residence at Richmond till the 15th of May 1833.

Kean in his person was small, but well-formed; his face was thin, but handsome; his eyes and hair were black; his countenance, in variety and intensity of expression, was wonderful; his voice, in its upper tones was somewhat harsh, in its lower tones it was soft and melodious; his action was free, graceful, varied, and appropriate; his conception of character was original and true. He did not, as some have supposed, trust to the impulse of his feelings. He studied the acting of his parts much and anxiously. Frequently, after his family were retired to rest, he would act scene after scene before the pier-glass, endeavouring to produce, by expression of countenance, gesture, emphasis, and modulation of voice, the effect which his conception of the character required.

Kean was indisputably the greatest tragedian of modern times; perhaps he has not been surpassed at any time. His Othello, in truth and vigour of conception, in brilliance of execution, and power of effect, was entitled to rank with the best of Mrs. Siddons's performances. It was an exhibition of consummate skill. The audience was irresistibly swept along by his overpowering energy and pathos, and acknowledged by a series of bursts of applause the intense sympathy which he had infused into all ranks of society and all degrees of intelligence with which the theatre was crowded. In some of his other characters he exhibited the striking points rather than the whole of the character; but this reproach did not apply to his Othello, Richard III., Shylock, and Sir Giles Overreach. These characters were all pervaded with an intensity of passion which he exhibited with matchless energy and truth. His power indeed was in the display of character and passion in all their varied shades. In passages of declamation he had peculiarities of intonation and utterance which gave him a strong and by no means pleasing mannerism.

* CHARLES KEAN the second but only surviving son of Edmund Kean, was born at Waterford, Ireland, in 1811, and educated during his father's prosperity at Eton. As already noticed he had adopted acting as his profession during his father's life, though much against his father's wish. Though well received in the provinces his success was at first but very moderate in London, and it was not till after a long provincial probation, and one or more visits to America, that he decidedly secured the favourable suffrages of metropolitan audiences. In 1842 he married the popular actress Miss Ellen Tree, and thenceforward they acted the chief male and female parts together. Since their return from Mr. Kean's last visit to America in 1847, they have been among the leading performers of the London season. In 1850 Mr. Charles Kean became lessee of the Princess's Theatre, at first in conjunction with Mr. Keeley, but from 1851 alone; and the London performances of himself and his wife have been subsequently confined to that theatre. Mr. Kean's early ambition was to succeed in the line of tragic characters in which his father achieved his fame, and despite some drawbacks of person, voice, and manner, he to a considerable extent attained success; but of late he has more particularly identified himself with parts of a melo-dramatic cast, such as those of the 'Corsican Brothers.' The great feature of Mr. Kean's management at the Princess's Theatre has been the 'restoration,' as it has been termed, of certain of Shakspeare's plays; in which they have (along with 'Pizarro' and 'Sardanapalus') been made the vehicle for exhibiting costly scenery and elaborate stage effects rather than fine acting. For some years past Mr. Kean has had the direction of the Royal theatricals at Windsor Castle.

KEANE, JOHN, first LORD KEANE, of Ghuznee in Afghanistan and of Cappoquin in the county of Waterford, was the second son of

Sir John Keane, Bart., of Belmont in that county, by Sarah, daughter of J. Kiley, Esq. He was born in 1781, and entered the army in his thirteenth year, his first commission bearing date 1793. Rising by gradual promotion, in 1799 he obtained a company in the 44th regiment of foot, became aide-de-camp to the Earl of Cavan in Egypt, and served for several years in the Mediterranean. In 1809 he took part in the campaign of Martinique, and was present at the siege of Desaix. Having obtained his colonelcy in 1812, he joined the British army in Spain under the Duke of Wellington, who intrusted him on his arrival at Madrid with the command of a brigade in the third division, with which he served until the peace of 1814, taking part in the battles of Vittoria, the Pyrenees, Nivelle, Orthes, and Toulouse, besides several other minor actions. In 1814, having attained the rank of major-general, he was appointed to a command ordered for particular service on the West India station. He accordingly proceeded to Jamaica, and with the military force under his command he co-operated with Admiral Cochrane in the attack on New Orleans. In the following December he effected a landing near that city, but was almost immediately superseded by Sir Edward Pakenham, who however appointed him to the command of a brigade under himself: in the subsequent attack on the enemy's fortified lines General Keane received two severe wounds. From 1823 to 1830 he held the commandship of the forces in Jamaica, and for upwards of a year administered the civil government of the island also. In 1833 General Keane was appointed commander of the forces at Bombay, and five years later received authority from the Indian government to organise and lead into Scinde a force intended to co-operate with the army under Sir Henry Pane. The chief command however of the combined forces almost immediately devolved on him. He was now called upon to lead a considerable army, and to conduct operations requiring much discretion, delicacy, and tact in dealing with those half-friendly powers whose existence is one of the greatest difficulties in the government of a semi-civilised country. With the open co-operation, but often in opposition to the secret intrigues, of these wavering friends, the British commander in India has much to do. After a long and harassing period of suspense, during which our army was exposed to much suffering and hardship, the British army entered Cabul in May 1839, and on the 21st of July Sir John Keane sat down before the fortress of Ghuznee, a citadel standing on a rocky eminence, and hitherto deemed impregnable. For thirty years the fortifications of the place had been constantly receiving additions to their strength, and it was garrisoned by 3500 Afghan soldiers under Mahomed Hyder Khan, a younger son of Dhost Mahomed Khan, the ruler of the country, with a commanding number of guns and an abundance of arms, provisions, and stores. Though surrounded by hostile tribes who severely harassed them in all directions, the British army on the 23rd of the month was set in motion for assailing the fortress. The gates were blown in; an entrance was effected, after a desperate struggle, though with the loss of only 200 men; and in forty-eight hours the English colours were flying upon the heights of Ghuznee. The Prince Mahomed Hyder surrendered himself a prisoner, and the city was restored to its lawful prince, against whom Mahomed had rebelled. This success inspired the British forces with the highest confidence, and proportionately despirited the native troops of Dhost Mahomed, who fled away on the approach of Sir John Keane to Cabul. Such was the end of a war in which the British forces were involved against their will by the perfidy of the Afghans, though there are not wanting those who say that the war itself might have been averted if our commander-in-chief had acted with greater prudence and discretion. For the capture of Ghuznee Lord Keane received the honour of a peerage, being created in December 1839 Baron Keane of Ghuznee in Afghanistan, together with the thanks of the court of the East India directors and of both houses of parliament, and other marks of royal and public approbation. The East India Company settled a pension of 2000*l.* a year upon himself and upon his two next successors in the title.

As to his professional character, it was said by those most competent to form a judgment that Lord Keane was more fortunate than skilful, and he was far from popular in his eastern command on account of a partiality towards the Queen's army, which led him to underrate the gallant services of the Company's officers, such as Sir William Nott and others; and in spite of the brilliancy of the *coup de main* by which he reduced Ghuznee, he failed to secure that unqualified approbation which great victories generally ensure for a commander-in-chief.

Lord Keane was twice married. By his former wife he left four sons, the eldest of whom succeeded to his title; his second wife, Miss Boland, whom he married after his return to England in 1840, survived him, and is since re-married to William Pigott, Esq., of Dullingham House, Cambridgeshire. Lord Keane died of the dropsy at Burton Lodge, Hampshire, August 24th, 1844.

KEATS, JOHN, was born in Moorfields, London, in the year 1796. He received a classical education at Enfield, under Mr. Clarke, and was afterwards apprenticed to a surgeon. Mr. Clarke introduced him to Mr. Leigh Hunt, who brought him before the public. In 1817 he published a volume containing his juvenile poems, and shortly afterwards his long poem 'Endymion,' which called forth a violent attack from the 'Quarterly Review.' Keats was of a remarkably sensitive disposition: his constitution was weak, and greatly impaired by the attentions which he bestowed on a dying brother, and his

death has been attributed, though erroneously, to the shock which he received from the article in the 'Quarterly.' To recover his health, Keats travelled to Rome, where he died on the 24th of February 1821, having previously published a third volume of poems, containing 'Lamia,' 'Isabella,' 'The Eve of St. Agnes,' and 'Hyperion.'

The poetry of Keats is of an exceedingly rich and luxuriant character, and his writings are so crowded with images, that it at last becomes almost fatiguing to apprehend them. It seems as if his imagination were of that volatile nature which must start off to every idea associated with his subject, and embody it as a part of the whole. Hence the reader must put himself in the place of the poet, and allow his own imagination to fly from thought to thought, or the work will seem but a compound of wild unconnected pictures. The article in the 'Quarterly' observed, that he introduced many images merely for the sake of rhyme, and this remark is not wholly unjust. He did not however like many poets, merely write some common-place epithet or sentence for the sake of rhyme; but it seems as if his imagination was so fertile, that a chiming word brought with it a new image suitable to his purpose. Some have thought that time would have matured his judgment and have improved him, but this is doubtful; the wild transition from thought to thought is the essence of his poetry, and not a mere accident, and a cool inquiry into the aptness or connection of his images would rather have injured him as a poet than have been of advantage.

In the sublime Keats is not so happy as in the wildly beautiful. In the fragment 'Hyperion,' despite its richness and wild luxuriance, where we miss the exuberance, we also miss the brilliant fancies of the 'Endymion,' while at the same time the attempt at sublimity is rather an incumbrance. It may in fact be said that the works of Keats are adapted chiefly to those who are really of a poetical temperament, and who have an imagination capable of following if not of creating; and to such they are highly stimulating and suggestive, as well as eminently delightful. To the readers who look for poetry as a pleasant form of some clear and connected subject, who prefer authors that rather anticipate their imagination than call it into violent action, Keats's poems will be of comparatively little value.

* KEBLE, THE REV. JOHN, at present and for a good number of years past, vicar of Hursley in Hampshire—a living worth 440*l.* a year—was born about the year 1790, and educated at Oriel College, Oxford, where he highly distinguished himself and took his B.A. degree in 1810. A prize essay 'On Translation from the Dead Languages,' recited by him in the Theatre of the University on the 10th of June 1812, was published at Oxford in the same year. After taking his M.A. degree he devoted himself partly to literature and criticism, though mainly to theology; and for some years he filled the professorship of poetry in the University of Oxford. His life however has been passed principally in the unobtrusive discharge of his duties as a parish-clergyman, in which office he is singularly assiduous, and in occasional authorship as a poet and a theological and controversial writer.

Mr. Keble's chief poetical work, entitled 'The Christian Year: Thoughts in verse for the Sundays and Holidays throughout the Year' was published in two volumes at Oxford in 1827, while he still held the poetry-professorship. It was followed by his 'Lyra Innocentium: or Thoughts in verse on Christian Children, their ways and their privileges,' also published at Oxford. These works, by their combination of poetical merits appreciable by all, with the spirit and language of what is known as High Church theology, have given the author a peculiar place among the English poets of the day. His 'Christian Year,' in particular, has been a great favourite with the lovers of devotional verse, more especially with those who belong to that party in the Church of England of which the author is one of the recognised representatives. Both it and the 'Lyra Innocentium' have passed through many editions. Mr. Keble's High Church sentiments however have been manifested more expressly in his prose writings. One of the original band of Oxford scholars and divines who began the so-named "Puseyite" movement in the English Church, he contributed, with Dr. Pusey, Mr. Newman, and others, to the famous 'Tracts for the Times' (1834-36); and a special disquisition of his on one of the subjects there treated—the value of 'Primitive Tradition' in theology, and its recognition by Scripture—was published separately with his name as Tract 78 (1837). Mr. Keble was also joint-editor, with Dr. Pusey and others, of the 'Bibliotheca Patrum Ecclesie Catholice,' the publication of which began in 1838. Besides various academic prolections held at Oxford between 1832 and 1841, he has published not a few sermons on points of High Church doctrine and discipline, and one or two pamphlets of a similar nature. A collection of his sermons under the title of 'Sermons Academical and Occasional,' reached a second edition in 1848. He also published 'The Children's Christian Year,' a similar work to the 'Christian Year,' but adapted more particularly for children or young persons; and 'The Psalter: or Psalms of David translated into English verse.' One of his latest publications entitled 'A very few plain thoughts on the proposed addition of Dissenters to the University of Oxford' (1854) exhibits him in his characteristic aspect as a High Church polemic.

KEILL, JOHN, a distinguished British mathematician and natural philosopher, was born at Edinburgh in 1671, and having received the

rudiments of education in that city, he completed his course of study in its university, of which the celebrated Dr. Gregory was then the mathematical professor. In 1694 he was entered in Balliol College, Oxford, where he distinguished himself by the lectures which he delivered in private on various subjects relating to natural philosophy, principally from the works of Newton; and in 1698 he published in London 'An Examination of Dr. Burnet's Theory of the Earth, with some Remarks on Whiston's New Theory.' In this work Keill pointed out, not without some harshness, the errors into which those theorists had fallen; and the severity of his strictures drew from each of them a reply: it is evident however that the advantage in the argument is on the side of Keill. In 1700 he was elected a Fellow of the Royal Society of London, and in the same year he succeeded Dr. Millington as Sedleian professor of natural philosophy. Two years afterwards he published a work in Latin under the title of 'Introductio ad veram Physicam,' which was well received in this country, and was also much esteemed in France—it being there considered as an excellent key to the 'Principia' of Newton. An edition of it in English was published in London in 1738, under the title of 'An Introduction to Natural Philosophy,' &c.

In 1709 Keill went to New England with the appointment of treasurer to the Palatines, who were sent to America as emigrants at the expense of the British government; these persons had been induced to leave Germany, and were living in London in great poverty: he returned however in the following year, and was immediately chosen Savilian Professor of Astronomy at Oxford. In the year 1711 he was charged by Queen Anne with the duty of deciphering papers; and it is mentioned as a proof of his sagacity that he once deciphered a letter written in Swedish, though he knew not a word of the language. He held this post about five years.

In 1713 the University of Oxford conferred on him the degree of Doctor in Physic; and in that year he published an edition of Commandine's 'Elements' of Euclid, with a tract on Trigonometry, and one on the Nature of Logarithms. In 1718 he published a work entitled 'Introductio ad veram Astronomiam,' which he afterwards translated into English, and published in 1721 under the title of 'An Introduction to the true Astronomy, or Astronomical Lectures delivered at Oxford.'

In the 'Philosophical Transactions' for 1708 there are two papers by Keill, of which the first is entitled 'On the Laws of Attraction and other Physical Principles,' and the other, 'Of the Laws of Centrifugal Force.' In the volume for 1713 there is a paper by him on 'The Newtonian Solution of Kepler's Problem,' &c. He also gave a paper entitled 'Theoremata quaedam Infinitam Materie Divisibilitatem spectantia;' and one which is designated 'Observations on Mr. John Bernoulli's Remarks on the Inverse Problems of Central Forces, with a New Solution of the Problems;' both of these were published in the 'Transactions' for 1714.

Dr. Keill died September 1, 1721, in the fiftieth year of his age. A writer in the 'Acta Eruditorum' having, in a notice of Newton's Treatise on the Quadrature of Curves, stated that the English philosopher had taken the method of Fluxions from Leibnitz, the indignation of Newton's friends was excited; and in the paper on the Laws of Attraction, &c., which, as above mentioned, was published in the 'Philosophical Transactions,' Keill formally asserted the claims of Newton to priority in the discovery. This paper gave offence to Leibnitz, who, in a letter to the secretary of the Royal Society, required that Keill should be compelled to retract his assertion: this was not done; and Keill, in a letter to the secretary, detailed the evidences of what he had stated.

Dr. Keill was not fortunate on another occasion. Entering into the war of problems which was at that time carried on between the English mathematicians and those of the Continent, he somewhat presumptuously challenged John Bernoulli to determine the path of a body when projected in a medium which exercised on it a resistance varying with the square of the velocity: the challenge was accepted, and before Keill could complete his own solution, Bernoulli announced that he had succeeded in obtaining one. Keill was, in consequence, compelled to endure in silence the reproach which the foreign mathematician did not fail, unsparingly, to administer.

An edition, in Latin, of Dr. Keill's principal works was published at Milan, in 1742, in 4to, under the title 'Introductio ad veram Physicam et Astronomiam (Huygenii Theoremata de Vi Centrifuga), quibus accedunt Trigonometria; de Viribus Centralibus; de Legibus Attractionis.'

KELLGREN, JOHAN HENRIK, a Swedish poet of great influence on one period of the literature of his country, was born at Flöby in West Gothland on the 1st of December 1751; studied at the University of Abo, which then belonged to Sweden; and in 1774 transferred himself to Stockholm, where he established the newspaper 'Stockholms Posten.' At that time the Swedes were sedulous imitators of the French; in tragedy, as in everything else, French taste was scrupulously followed; and the newly-rising German literature, and English literature of the time preceding Addison and Pope, were looked upon as barbarous and unworthy of notice. In the 'Stockholms Posten' these views were advocated with liveliness and ingenuity, and Kellgren not only earned a high place in the public estimation as a critic, but as a poet, chiefly by some lyrics remarkable for the harmony of their

language, which brought the poetry of the 'Posten' into high repute. For several years Kellgren was the most distinguished poet of Sweden with the exception of Leopold, the acknowledged head of the French school. On the institution of the Swedish Academy in 1786, the king Gustavus III., with whom Kellgren was a special favourite, named him one of the members; and he also named him his private secretary and librarian, both sinecures, with a salary which placed him at his ease. He died within two years after the king's death, on the 20th of April 1795, after two years of suffering from severe illness. His collected works, 'Samlade Skrifter,' were published in three volumes at Stockholm in 1796, and have been since reprinted. His death was at the time deplored as a national loss. Posterity has been more disposed to acquiesce in his own modest description of himself:—"There was a little man in our literary world whose talents were small: he had not perhaps what is called genius; most of his writings had little width and weight; but he had one quality perhaps in a higher degree than any of his rivals—it was a warmth, a zeal for the improvement and honour of Swedish literature, which kept to him constantly during a laborious life, and which was his last passion at the hour he wrote these lines."
